Arcata, CA 95521

Re: City of Arcata Wastewater Treatment Facility Improvements Project, Arcata, CA

Dear Mr. Loya:

The California State Historic Preservation Officer received the consultation submittal for the above referenced undertaking for our review and comment pursuant to Section 106 of the National Historic Preservation Act and its implementing regulations found at 36 CFR Part 800. The regulations and advisory materials are located at www.achp.gov.

Pursuant to 36 CFR §800.4(d) we do not object to the City of Arcata's finding that no historic properties will be affected by the proposed wastewater treatment facility improvements project. However, the City may have additional Section 106 responsibilities under certain circumstances set forth at 36 CFR Part 800. For example, in the event that historic properties are discovered during implementation of the undertaking, your agency is required to consult further pursuant to §800.13(b).

We appreciate the City of Arcata's consideration of historic properties in the project planning process. If you have questions please contact Shannon Lauchner Pries, Historian II, with the Local Government & Environmental Compliance Unit at (916)445-7013 or by email at shannon.pries@parks.ca.gov .

Note that we are only sending this letter in electronic format. Please confirm receipt of this letter. If you would like a hard copy mailed to you, respond to this email to request a hard copy be mailed.

Sincerely,

Julianne Polanco
State Historic Preservation Officer

Hello Delo,

I do not have any specific concerns about the project and agree with both Janet and Ted that inadvertent discovery protocols are sufficient moving forward.

Thanks.

**Subject:** Re: AB 52 Consultation for Arcata Wastewater Treatment Plant Upgrades - Blue Lake

Emily, Mark and Delo,

I have reviewed the Nov. 2019 cultural resources study for the subject project prepared by DZC and find it very thorough. I have no knowledge of cultural resources in the project APE.

I concur with the recommendation that the Inadvertent Archaeological Discovery Protocol be made a project condition. As there are no Tribal Cultural Resources that will be affected by this project, the Blue Lake Rancheria decline the invitation for government consultation with the City of Arcata.

Regards,

JANET P. EIDSNESS, M.A. Tribal Historic Preservation Officer (THPO) for Blue Lake Rancheria HOME: 2488 Sonnenfelt Road, Bayside, CA 95524 (707) 825-0460 (VOICE), (530) 623-0663 (CELL) jpeidsness@yahoo.com

On Thursday, July 9, 2020, 03:09:05 PM PDT, Emily Benvie <ebenvie@cityofarcata.org> wrote:

Hi Janet & Jacob,

On behalf of Mark Andre, I have attached the AB52 consultation letter for the proposed Arcata Wastewater Treatment Plant Upgrades. The packet is quite large, so we will send the letter and maps by mail as hard copies. If you would like hard copies of any of the other technical reports, we are happy to send upon request. Also, the PDF of the complete packet is too large to attach all three packets in one email, so I apologize that you all will receive three emails regarding the same project. Please let us know if there is any other information on the project. Best,

Emily Benvie

FROM: Mark Andre, City of Arcata

RE: Tribal Cultural Resources under the California Environmental Quality Act, AB 52 (Gatto, 2014). Formal Notification of determination that a Project Application is Complete or Decision to Undertake a Project, and Notification of Consultation Opportunity, pursuant to Public Resources Code § 21080.3.1 (hereafter PRC).

Dear Chairman Hernandez:

The City of Arcata has decided to undertake the following project: Wastewater Treatment Facilities Improvement Project

Pursuant to PRC § 21080.3.1 (d), please find a description of the proposed project below; two maps showing the project location and Area of Potential Effect are enclosed; and the project point of contact is Mark Andre.

Also included with this consultation are the following documents:

1. A Cultural Resources Report for the project, prepared by DZC Archaeology and Cultural Resource Management, in November 2019
2. Part 1 of Geotechnical Exploration and Geologic Hazards Report, prepared by LACO Associates, which includes geologic cross sections
3. An Engineering Geologic and Hydrogeologic Exploration, prepared by LACO Associates, which includes information related to the soils and boring locations

Hard copies of the above documents (1-3) may be sent upon request.

Description of Proposed Project

The City of Arcata proposes to construct upgrades to the existing Arcata Wastewater Treatment Facility (Treatment Facility, or Facility) to update aging infrastructure and comply with the requirements of Regional Water Quality Control Board (RWQCB) Order No. 1-2019-0006. Ongoing preventative maintenance has kept the original treatment plant in operation but there has been little replacement of equipment or structures since original construction.

The Treatment Facility provides secondary treatment using natural processes including two oxidation ponds and six constructed wetland treatment marshes. Enhancement to the secondary treated water is provided by three enhancement marshes located in the Arcata Marsh Wildlife Sanctuary (Wildlife Sanctuary). The Treatment Facility currently includes headworks, primary clarifiers, oxidation ponds, treatment wetlands, enhancement wetlands, and chlorine disinfection. Treated effluent is discharged into the Humboldt Bay (Outfall 001) or is circulated into Enhancement Wetlands (Outfall 002) in the Wildlife Sanctuary for further treatment. Solids removed in the primary clarifier are treated in anaerobic digesters and solids drying beds.

Proposed upgrades include oxidation pond and wetland treatment system improvements, construction of a parallel oxidation ditch treatment system/secondary clarification, construction of an Ultraviolet (UV) disinfection system upstream of discharge to the Enhancement Marshes, and an updated Facility configuration allowing for discharges below 6 MGD to enter the newly created Brackish Marsh following treatment through the enhancement marshes to provide overall improvements to effluent quality discharged to Humboldt Bay/McDaniel slough.

The upgraded disinfection system will include a new UV System equipment which will be purchased with Community Development Block Grant (CDBG) funds, which requires this environmental assessment. The installation of the 9.8 MGD capacity UV disinfection system will replace the existing break point chlorination disinfection system utilizing chlorine gas (CL2) and sulfur dioxide (SO2). This will reduce the number of violations for dichlorobromomethane, a chlorine disinfection by-product. This byproduct has historically been one of the major environmental concerns with Arcata's treated effluent. The UV will also allow the City to dramatically reduce Cl2 and SO2 storage and usage and hopefully will be able to be entirely removed in phase 2.

The full scope of the upgrades will be undertaken in two separate phases, and will include the following elements:

*Phase 1* will focus on rehabilitation of the current system and reconfiguring the effluent flow to a single path. Rehabilitation will be done to the natural system facilities (i.e. ponds and the wetlands) and to the aging infrastructure. It will include replacing and installing new equipment (i.e. pumps, aerators and monitoring equipment), and increasing resilience of facilities for treatment and hydraulic capacities. Many of the activities associated with Phases 1 and 2 would be considered routine maintenance of the plant if evaluated as stand-alone activities.

Phase 1 includes:

- Excavation and contouring for improved water quality and maintenance at the outlet of the Hauser Enhancement Marsh.
- Laying new discharge pipe to the new Outfall 003 in the brackish marsh from the existing Hauser pump station.
- Replacing aged equipment (screw pumps, bar screen and grit chamber reconstruction/rehabilitation) in the existing headworks structure foot print.

- Installation of a 9.8 MGD ultra-violet UV disinfection system into one half of the existing chlorine contact basin (CCB), eliminating the use of chlorine gas and sulfur dioxide for disinfection except in an emergency disinfection scenarios (flows > 9.8 MGD) or if emergency electrical power was interrupted.
- Replacement of existing clarifier no.2 rotating center armature/skimmer, various flow configuration improvements throughout the system for automation and creating a higher quality effluent.
- Placement of up to 24 new 12.5 Hp mixer aerators to improve treatment within the oxidation pond 2.
- Replacement/upgrading of aboveground vertical pumping stations within the plant and at Hauser Marsh pump station with submersible variable speed pumping systems.
- Installation of new SCADA and plant control and monitoring system for all AWTF operations to be constructed within the existing centralized control room.
- Construction of new building for the placement of new electrical services, PGE connection and switch gear including a diesel powered emergency generator rated at 0.75 MW and removal of an existing natural gas powered 150 KW generator.
- Placement of structural fill up to 1.5' deep to elevate the existing 16' wide roadway between The Hauser Treatment Marsh and Gearheart Treatment Marsh to minimum height of 8.0'.
- Adding additional photovoltaic panels to existing facility roofs.
- Raise levees to meet minimum FEMA and City requirements for construction of new/rehabilitated facilities.

*Phase 2* will focus on constructing the additional secondary treatment system, as well additional site improvements within the AWTF and the City of Arcata Corp Yard. In general Phase 2 builds on the performance of Phase 1 improvements.

Phase 2 includes construction of all the additional facilities needed for the parallel secondary treatment facility, including:

- Construction of the new oxidation ditch.
- Construction of two new secondary clarifiers and pumping for the return activated sludge (RAS) and the waste activated sludge (WAS).
- If determined necessary, following ongoing Phase 1 performance, an alkalinity feed system may be constructed within the existing developed AWTF.
- The large footprint of the preferred design will require relocation of some of the AWTF facilities ties within the project area.

Excavation depths of various project elements vary but are limited to eight (8) feet, with the exception of the piles necessary to secure the headworks improvements, clarifier center mount and electrical building Maximum depth 85' with 3' diameter drilled piers.

The majority of ground-disturbing activity will involve laying new discharge pipe and electrical conduit; both activities will only require ground disturbance of up to four (4) feet. All ground-disturbing activity in the APE will occur south of Samoa Boulevard, which loosely demarcates

the historic perimeter of Humboldt Bay. **Refer to the LACO Geohazards Report for more information on soils in the project area.**

Additionally, the following table may be helpful in evaluating different elements of the project, though construction depths will be draft until the final design of the project is complete:

## 1.1 Project Description

A list of improvement components, along with anticipated dimension, foundation elevations, loads, and occupancy categories is presented in Table 1. The location of these improvements are shown on Site Plan, Figure 2.

*Table 1. Improvement Component Locations*

| Improvement Component | Anticipated Plan Dimensions (feet) | Anticipated Foundation Depth (feet) | Anticipated Foundation Loads (ksf) | Occupancy Category |
|---|---|---|---|---|
| Headworks | 22 x 52 | 3.3 | 2.5 | 3 |
| Headworks | 17 x 15 | -1.9 | 2 | 3 |
| Oxidation ditch | 65 x 266 | 1.5 | 2 | 3 |
| Secondary Clarifier (2) | 75 (diameter) | -3.8 | 2 | 3 |
| UV Disinfection channels and canopy | 14 x 58 | 6 | 2 | 3 |
| Thickener – at grade portion | 20 x 25 | 8 | 1.5 | 3 |
| Thickener – below grade portion | 22 x 15 | 5 | 1.5 | 3 |
| Chemical storage facility | 20 x 50 | 8 | 1.5 | 3 |
| New Electrical Building | 24 x 37 | 8 | 1.5 | 3 |
| New Generator | 5 x 12 | 8 | 1.5 | 3 |
| New Transformer | 5 x 5 | 8 | 1.5 | 3 |
| New ML Flow Split Structure | 29 x 22 | 6.3 | 2 | 3 |
| New RAS Pump Station | 26 x 40 | -3.8 | 1.5 | 3 |
| New WAS Pump Station | 18 x 18 | 8 | 1.5 | 3 |

DRAFT

Pursuant to PRC § 21080.3.1 (b), you have 30 days from the receipt of this letter to request consultation, in writing, with the City of Arcata.

Very Respectfully,

Mark Andre, Director Environmental Services

*STATEMENT OF CONFIDENTIALITY*

***This document is not for public distribution.*** ***This report identifies the locations of cultural resource sites. Disclosure of this information to the public may be in violation of both federal and state laws. Applicable United States laws include, but may not be limited to, Section 304 of the National Historic Preservation Act (NHPA) (16 U.S.C. 470w-3), the Archaeological Resources Protection Act (ARPA) [16 U.S.C. Section 9(a) and Section 470(hh)], and Executive Order 13007. In California, such laws include, but may not be limited to, Government Code Section 6254.10. Site location information is confidential and is not for public disclosure.***

***Additionally, records maintained or in the possession of the Native American Heritage Commission or state and local agencies that are exempt from public disclosure include those that contain information on Native American graves, cemeteries, and sacred places, and include records obtained during consultation with Native Americans (California Government Code §6254(r) and §6254.10).***

*LIMITATIONS STATEMENT*

***This report has been prepared based on certain key assumptions made by DZC Archaeology & Cultural Resource Consulting, LLC (DZC) that substantially affect the conclusions and recommendations of this report. These assumptions, although thought to be reasonable and appropriate, may not prove to be true in the future. The conclusions and recommendations of DZC are conditioned upon these assumptions.***

***These assumptions include confidential information provided by the Native American Heritage commission on September 10, 2019, by the Northwest Information Center on July 19, 2019, and by direct observation of site conditions and other information that is generally applicable as of October 9, 2019. The conclusions and recommendations herein are therefore applicable only to that timeframe. Information obtained from these sources in this timeframe is assumed to be correct and complete. DZC will not assume any liability for findings or lack of findings based upon misrepresentation of information presented to the project team or for items not visible, made available, accessible, or present at the site at the time of the Project site survey.***

# MANAGEMENT SUMMARY

This report details the results of a Phase I Cultural Resources Inventory conducted by DZC Archaeology & Cultural Resource Consulting, LLC (DZC) on portions of Humboldt County Accessor's Parcel Numbers (APN) 503-241-010, 503-232-013, 503-251-012, 503-211-026, 503-241-016, 503-251-009, 503-241-011, 503-241-013, 503-211-005, 503-241-012, and one unnumbered parcel. The parcels combined represent the City of Arcata Wastewater Treatment Facility (AWTF) and City Corporate Yard. The City of Arcata retained DZC to conduct the inventory in support of a National Pollutant Discharge Elimination System (NPDES) permit through the North Coast Regional Water Quality Control Board (NCRWQCB).

Approximately 123 acres comprise the Area of Potential Effects (APE), located in the City of Arcata, Humboldt County, California. The legal location of the APE is Township 6 North, Range 1 West, Section 32, and Township 5 North, Range 1 East Unsectioned, of the Arcata South 7.5-Minute USGS Quadrangle (Humboldt Baseline Meridian). The Environmental Study Limits (ESL) constitute a 0.5 mile radius around the APE.

The City of Arcata is the Lead Agency providing regulatory oversight for the permitting process. The purpose of this cultural resources inventory is to satisfy the requirements of the National Environmental Policy Act (NEPA) of 1969, Section 106 of the National Historic Preservation Act (NHPA) of 1966, and the California Environmental Quality Act (CEQA) of 1970 (all as amended), and the City of Arcata Historical Preservation Element.

In advance of a field survey of the APE, DZC completed historical research for the APE and ESL at the Northwest Information Center of the California Historic Resources Information System (NWIC). The review identified 16 previously conducted archaeological surveys of interest: 10 surveys within the APE, and six outside the APE but either partially or completely within the ESL. Five previously recorded resources were identified within the ESL and one within the APE. The geoarchaeological research indicated a low potential for buried and surface prehistoric resources, and a moderate potential for buried and surficial historical resources within the APE.

A field survey of the APE was undertaken on October 9th, 2019, and November 5th, 2019, by Dimitra Zalarvis-Chase, M.A., RPA a U.S. Secretary of the Interior qualified archaeologist and staff archaeologist Kelly Hollreiser (B.A.). Of the 123 acres, 75 acres were intensively surveyed in transects of 15 meters or less. Approximately 48 acres within the APE are unsurveyable ponds, wetlands, and marshes. Impediments to ground visibility included dense vegetation, imported gravels, and paved areas. The surface scrapes were utilized where visibility was poor.

One built environment complex, the AWTF, and a mapped alignment of a California Historical Landmark (CHL) No.842 (The Arcata and Mad River Railroad/Union Wharf and Plank Walk Company) are present within the APE. The AWTF was determined ineligible for the National Register of Historic Places in 2006. Portions of CHL No.842 within the APE are limited to a historically mapped alignment; the remaining physical elements are located outside of and immediately adjacent to the APE.

This report recommends a Finding of No Impacts to historical, archaeological, or tribal cultural resources, as defined by CEQA, and a Finding of No Effects, as defined by NEPA. It is best practice to avoid cultural resources whenever possible. Additional survey will be required if the project changes to include areas not previously surveyed.

# 1.0 INTRODUCTION

## 1.1 PROJECT DESCRIPTION

The City of Arcata Wastewater Treatment Facilities (AWTF) Improvements Project aims to improve local water management facilities by addressing National Pollutant Discharge Elimination System (NPDES) requirements for wastewater treatment in Arcata, California (City of Arcata 2019). The goals of the project are to address sea level rise and long-term community requirements through improvements to current and future infrastructure at the AWTF. The project will be completed in two phases and will include improvements to oxidation ponds, treatment wetlands, and other infrastructure at their northern Humboldt Bay location (Appendix A, Figures A1-A4).

The city of Arcata retained DZC Archaeology & Cultural Resource Consulting, LLC (DZC) to conduct a cultural resource investigation of the AWTF Improvements Project to support compliance of State and Federal regulations regarding cultural resources, Native American resources, and historic properties. DZC is an environmental consulting firm with over 10 years of experience with projects throughout northern California. DZC conducts cultural resource studies in accordance with the Secretary of the Interior's standards and in compliance with all applicable federal, state, and local codes, acts, regulations, and orders relating to cultural resources, where applicable. This cultural resources inventory report was prepared by Dimitra Zalarvis-Chase, a Registered Professional Archaeologist, who meets the Department of the Interior's Professional Qualifications Standards in Prehistoric and Historic Archaeology, with contributions by Sydney Kerkhove-Peltier, B.A., Jaques Kerkhove-Peltier, M.A., and Kelly Hollreiser, B.A.

## 1.2 PROJECT LOCATION

The 123-acre (ac) project area is situated in Humboldt County, California, along the northern shoreline of Humboldt Bay and south of Humboldt State University (Figure 1). The legal location of the project area is Township 6 North, Range 1 East, Section 32; Township 5 North, Range 1 East, Unsectioned; Humboldt Base Meridian, of the United States Geological Survey (USGS) Arcata South 7.5-Minute Series (1959) Quadrangle (Figure 2).

## 1.3 DELINEATION OF THE APE & ESL

The physical location with the potential for impact to archaeological resources is designated as the Area of Potential Effects (APE). The Environmental Study Limits (ESL) for the project area constitutes an additional 0.5-mi background review radius around the APE.

An APE varies depending on the potential impacts of the project, the type of environmental clearance required, and the Lead Agency. The 123 ac area constitutes the APE for this project. The proposed project must meet National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA) standards, as the project requires a permit from the North Coast Regional Water Quality Control Board (NCRWQCB), funded by the Clean Water State Revolving Fund (CWSRF), a federal financing program discussed further in Section 2.1.1 of this report.

Horizontal boundaries for the APE were provided to DZC by the City of Arcata. The APE is composed of four separate study units, including four staging areas (Figure 2, Table 1). Unit 1 (Staging Area 1) measures 388 ft (north-south) by 300 ft (east-west); Unit 2 (Staging Area 2) measures 466 ft (north-south) by 139 ft

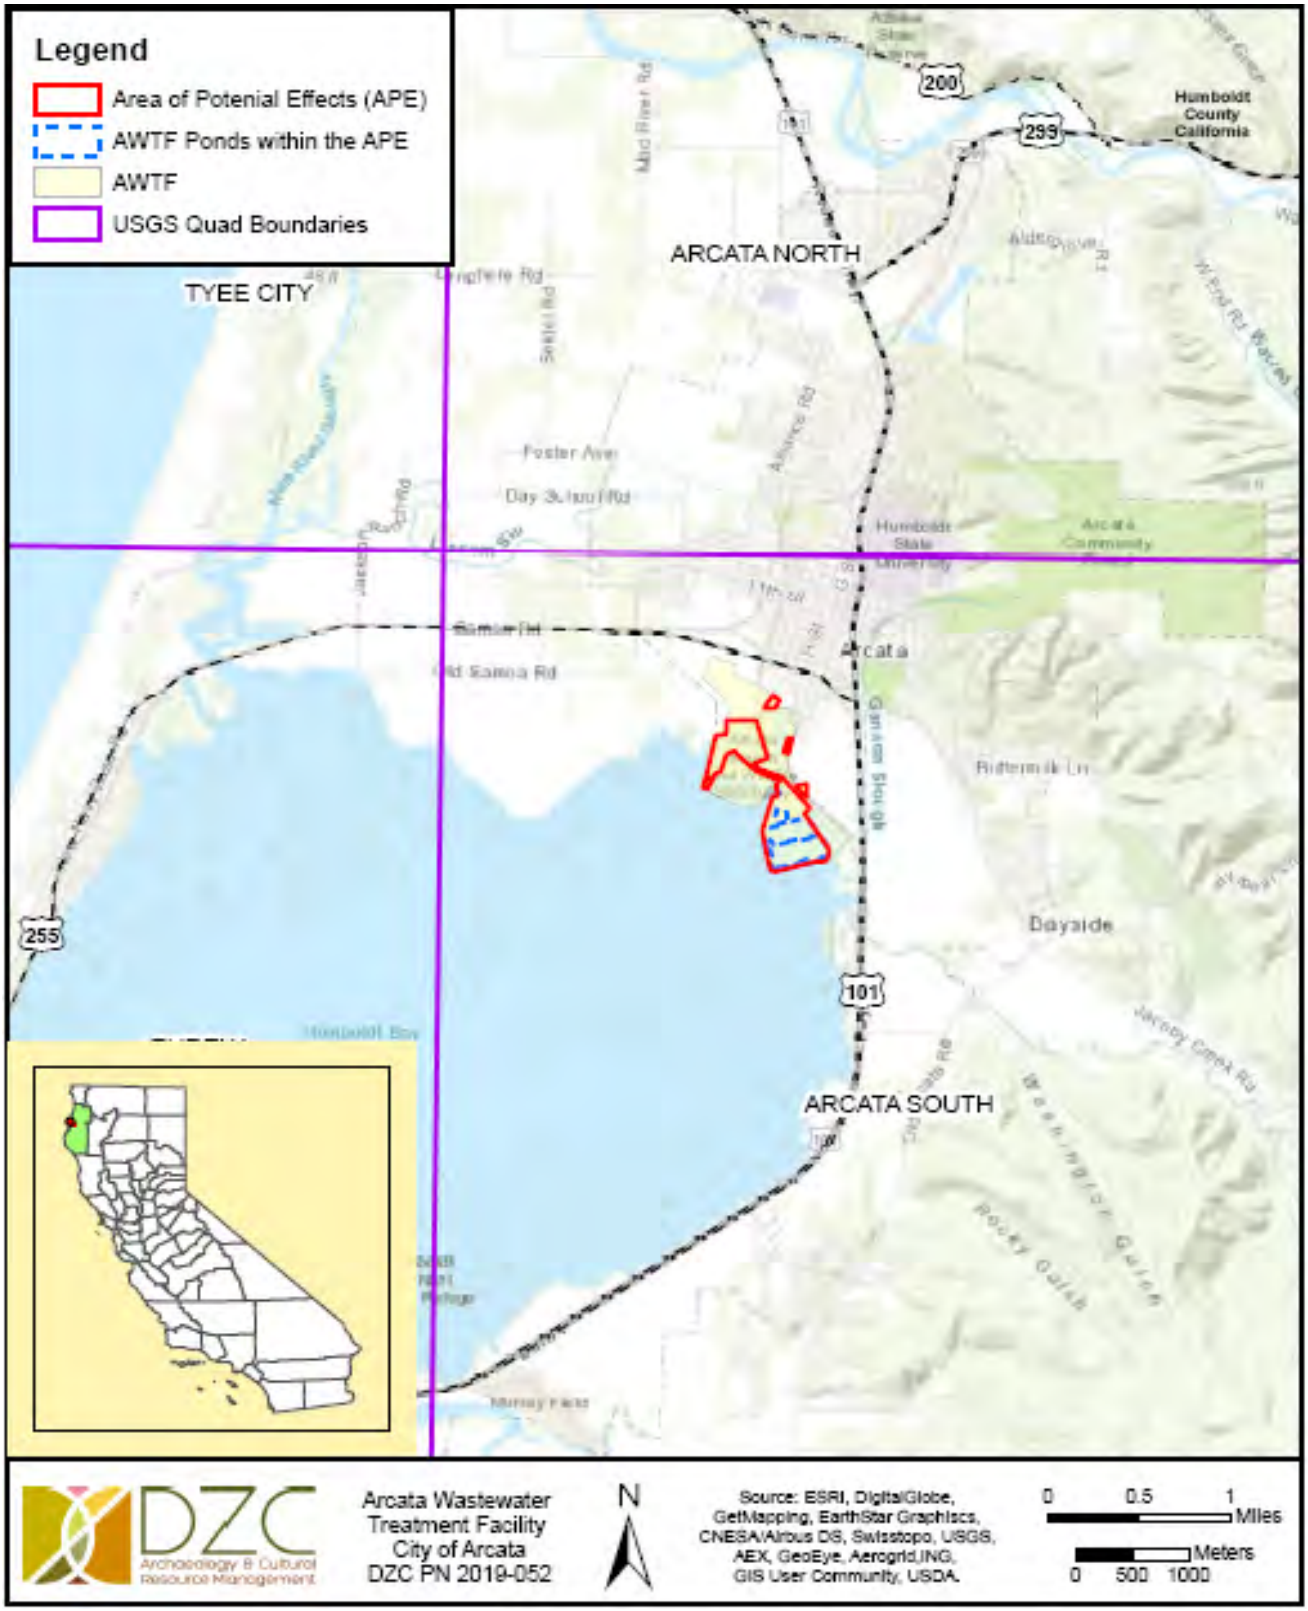

**Figure 1 Project Vicinity**

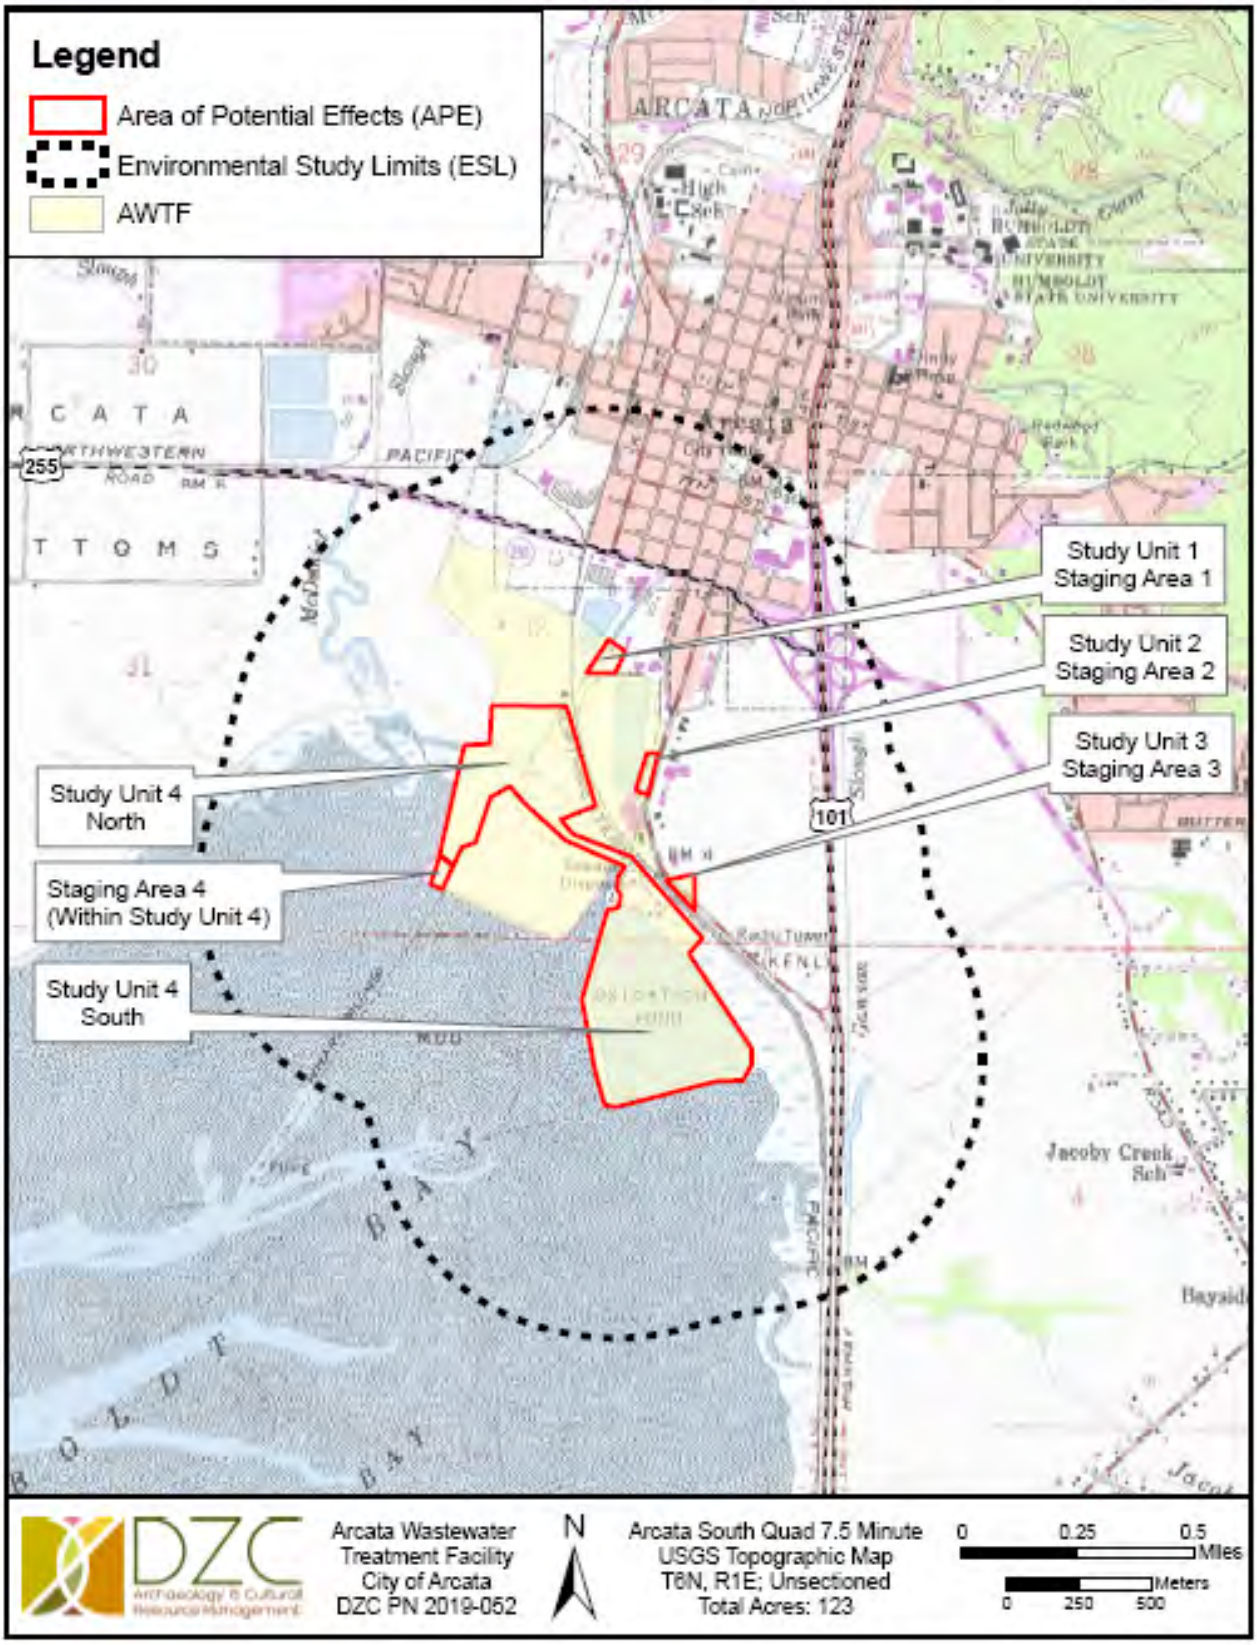

**Figure 2 Project Location**

(east-west); Unit 3 (Staging Area 3) measures 288 ft (north-south) by 302 ft (east west); and Unit 4 (Staging Area 4) measures 257 ft (north-south) by 168 ft (east-west). Staging Area 4 is completely encompassed in the northern section of the largest APE polygon. Unit 5 is the largest area, consisting of northern and southern sections. It also encompasses Staging Area 4. The horizontal boundaries of the northern section of APE Unit 5 measure approximately 2,173 ft (north-south) by 1,495 ft (east-west). The horizontal boundaries of the southern section measure approximately 2,520 ft (north-south) by 1,827-ft (east west).

**Table 1. Project location descriptions.**

| APE Study Unit | Legal Location | AWTF Association | Acreage |
|---|---|---|---|
| **1** | Arcata South Quad T6N, R1E, Section 32 | Staging Area 1 | 2.1 acres |
| **2** | Arcata South Quad T6N, R1E, Section 32 | Staging Area 2 | 1.5 acres |
| **3** | Arcata South Quad T6N, R1E, Section 32 | Staging Area 3 | 1.5 acres |
| **4** | Arcata South Quad T6N, R1E, Section 32 | Staging Area 4 | 1.1 acres |
| **4** | Arcata South Quad T6N, R1E, Section 32; T5N, R1E, Unsectioned | Arcata Marsh; Treatment Ponds; City Yard | 117 acres |

DZC did not have access to the structural engineering designs for the AWTF project, and therefore the vertical APE for this study is based limited information concerning the types and diameters of pipes that are proposed to be installed (Appendix A, Figures A-3 through A-6). The largest of these is 30 inches (in.) in diameter, and therefore the expected vertical excavation depth would be approximately 3-5 ft below the ground surface. The vertical APE is expected to range from -5 ft below to approximately +10 ft above the ground surface.

It is highly desirable to conduct all surveys prior to ground disturbance. However, ground disturbance in the form of grading, facilities and levee construction, and pond, marsh, and wetland excavations all occurred on site prior to the archaeological survey.

# 2.0 Regulatory Setting

## 2.1 State

The following sections discuss the regulatory guidelines for this Cultural Assessment Report.

### 2.1.1 California Environmental Quality Act (CEQA)

The lead agency for this project is the City of Arcata. CEQA requires a lead agency to determine whether a project may have a significant effect on historical resources (Section 21084.1). If it can be demonstrated that a project will cause damage to resources Eligible for or Listed in the California Register of Historical Resources (CRHR), Tribal Cultural Resources (TCRs), and other resources on county or local lists, or those determined by the lead agency to be significant, the lead agency may require reasonable efforts be made to permit any or all of the resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (Section 21083.2[a], [b], and [c]).

A historical resource is a resource listed, or determined to be eligible for listing, in the CRHR (Section 21084.1); in a local register of historical resources (Section 15064.5[a][2]); or any object, building, structure, site, area, place, record, or manuscript that a lead agency determines to be historically significant (Section 15064.5[a][3]).

Public Resource Code (PRC) Section 5024.1, Section 15064.5 of the CEQA Guidelines, and PRC Sections 21083.2 and 21084.1 were used as the basic guidelines for this cultural resources study. PRC Section 5024.1 requires an evaluation of historical resources to determine their eligibility for listing in the CRHR. The purpose of the register is to maintain listings of the state's historical resources and to indicate which properties are to be protected from substantial adverse change. The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the National Register of Historic Places (NRHP), enumerated below.

According to PRC Section 5024.1(c) (1–4), a resource is considered historically significant if it (i) retains "substantial integrity," and (ii) meets at least one of the following criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
2. Is associated with the lives of persons important in our past;
3. Embodies the distinctive characteristics of a type, period, region or method of installation, or represents the work of an important creative individual, or possesses high artistic values; or
4. Has yielded, or may be likely to yield, information important in prehistory or history.

Impacts to significant cultural resources that affect the characteristics of any resource that qualify it for the NRHP or adversely alter the significance of a resource listed on or eligible for listing in the CRHR are considered a significant effect on the environment. These impacts could result from "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines, Section 15064.5 [b] [1], 2000). Material impairment is defined as demolition or alteration "in an adverse manner [of] those characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the California Register…" (CEQA Guidelines Section 15064.5[b] [2] [A]).

### 2.1.2 Clean Water State Revolving Fund (CWSRF) Program

The CWSRF program is partially funded by the United States Environmental Protection Agency (USEPA) that provides low- interest financing and is administered by the Division under the California State Water Resources Control Board (SWRCB). The purpose of the CWSRF Program is to implement the Clean Water

Act and various state laws by providing low-interest financing for construction and improvement of wastewater treatment facilities.

Due to the federal nexus with USEPA, federal laws and regulations (e.g. federal cross-cutters) apply to all projects pursuing CWSRF financing. Under the CWSRF program, the Division under the State Water Board uses the CEQA document plus the federal cross-cutting documentation in place of a National Environmental Policy Act (NEPA) documents, which is defined "CEQA_Plus" documentation. The State Water Board does not complete a NEPA review process, but rather completes the "NEPA-like" process of CEQA-Plus.

#### 2.1.3 Assembly Bill 52 (AB 52) Native American Consultation & CEQA

In 2016, CEQA established a consultation process with all California Native American Tribes, including both federally and non-federally recognized tribes that are historically connected and culturally affiliated with the project location. This bill has established the TCR classification and requires consideration of Tribal Cultural Values in determination of project impacts and mitigation, requires tribal notice of the project, and requires meaningful consultation.

In accordance with PRC Section 21080.3.2(b), consultation ends when either both parties agree to mitigation measures, other agreements to avoid a significant effect on TCR's, or, when a party, acting in good faith and after reasonable effort concludes that mutual agreement cannot be reached.

### 2.2 Humboldt County

Approved by the County in May of 2012, Section 10.6 of the General Plan, Cultural Resources of the Humboldt County Conservation and Open Space Element Chapter, provides general guidance for the protection of cultural and paleontological resources within the County. Section 10.6.3 outlines the goals and policies of the County:

#### 2.2.1 Goals

CU-G1: Protection and Enhancement of Cultural Resources. Protected and enhanced significant cultural resources, providing heritage, historic, scientific, educational, social and economic values to benefit to present and future generations.

#### 2.2.2 Policies

CU-P1: Identification and Protection. The potential for significant impacts to cultural resources shall be identified during ministerial and discretionary permit review, assessed as to significance, and if found to be significant, protected from substantial adverse change.

CU-P2: Consultation. Native American Tribes (as defined), historical organizations, other interested parties, and applicable agencies shall be consulted during discretionary project review for the identification, and protection and mitigation of adverse impacts to cultural resources. Consultation on ministerial permits shall be initiated if it has been determined the project may create a substantial adverse change in the significance of a cultural resource. At their request, Tribes shall be afforded the opportunity to review and provide comments to the County early in project review and planning (screening) about known or potential significant Native American cultural resources located in project areas within their respective tribal geographical area of concern.

CU-P3: Avoid Loss or Degradation. Projects located in areas known to have historic or prehistoric ruins, burial grounds, or archeological sites shall be conditioned and designed to avoid loss or substantial degradation of these resources, including standard provisions for post-review inadvertent discoveries of archaeological or Native American remains.

CU-P4: Findings Necessary for Loss or Destruction. Cultural resources shall not be knowingly destroyed or lost through a ministerial or discretionary action unless:

1. The site or resource has been found not to be of significant value after consultation by representatives of the cultural resources community and relevant experts; or
2. There is an overriding public benefit from the project, and compensating mitigation to offset the loss is made part of the project.

CU-P5: Mitigation. Mitigation measures shall be required for any permitted project or County action that would adversely impact significant cultural resources

The General Plan also includes recommendations for implementation of these goals and policies:

- Adopt procedures for review and approval of all City-permitted projects involving ground disturbance and all building and/or demolition permits that will affect buildings, structures, or objects "identified as historically significant" (City of Eureka 1997b:5-8).
- Adopt preservation incentive programs, including the Mills Act, Historic Preservation Easement program, and Certified Local Government Program.
- "Preparation, adoption, and implementation of a cultural resources ordinance that provides definitions and standards for identification and protection of cultural resources and provides penalties for their disturbance" (City of Eureka 1997b:5-8).
- Preparation and updating of a citywide cultural resource database.

The General Plan also designates Neighborhood Conservation Areas (NCAs) within the city of Arcata as areas that are historically noteworthy where review is conducted to assure that new construction, modifications or alterations are harmonious with the existing character of the neighborhood.

## 2.3 City of Arcata Historical Preservation

The City of Arcata General Plan includes a Historical Preservation element. As the AWTF project requires a permit from the City, it is subject to compliance with this element.

The following is excerpted from the Design and Historical Preservation Element (DHPE) (City of Arcata 2010):

> "An inventory of Arcata's historical structures and sites in 1979 [Susie Van Kirk: Reflections of Arcata's History: eighty years of architecture, 1979] identified four early periods of residential building styles: settlement (1850-1885) Victorian (1885-1900), Transitional (1900-1910) and Craftsman (1910-1930), in addition to the modern period (1930-present).
>
> The City's first historic preservation ordinance [Ordinance No. 935] was adopted by the City Council in 1980. Since that time, 85 structures or sites have been formally designated by ordinance as local historic landmarks. The City retains a map of Historic Landmarks, Neighborhood Conservation Areas, and Specific

Plan Districts. [Throughout this element the name of the Historic Landmarks Commission has been changed to Historic and Design Review Commission, per Ordinance No. 1377, September 2008.]"

The Guiding Principles and Goals of the DHPE are the following:

A. Promote preservation of structures and sites that are representative of the various periods of the city's social and physical development.
B. Preserve the historical character of the Plaza and the surrounding commercial district.
C. Encourage owners of eligible structures to seek historic landmark status and to invest in restoration efforts.
D. Conserve the many examples of early residential building styles found in the city's older neighborhoods, from Bayside to Arcata Heights.
E. Assure that new construction and additions to existing historically-designated buildings maintain the character and livability of the historic neighborhoods.
F. Promote interest in and appreciation of the value of Arcata's history and its heritage of historic buildings.
G. Encourage tourism and economic development through historic resource preservation.
H. Prevent destruction of archaeological and cultural resources and assure that any artifacts receive proper disposition.

# 3.0 SETTING

The following sections provide the environmental and cultural context of the APE and ESL.

## 3.1 NATURAL SETTING

The APE is located in the Coast Range geomorphic province in northwestern California (Wagner 2002). A review of the bedrock and surficial geology of the APE and the ESL on the Redding Sheet of the Geologic Atlas of California (Strand 1962) reflects the APE & ESL as underlain entirely by Recent Alluvium deposit, which is composed of alluvium, old alluvium, and young stream terrace deposits (ibid.).

The climate of the Humboldt Bay region is classified as Mediterranean in the Köppen Climate System (Köppen 1936), with average annual rainfall and temperatures of 68 in. and 44-85 degrees Fahrenheit, respectively (WRCC 2016).

As defined by Mayer & Laudenslayer (1988), the habitat setting is Wet Meadow (WTM), Fresh Emergent Wetlands (FEW), and Saline Emergent Wetlands (SEW), hosting a diverse array of wetland plants and animals.

## 3.2 CULTURAL SETTING

Early studies of prehistoric chronological sequences on the California north coast include efforts by Loud (1918), Bickel (1979), Hayes et al. (1980), and Moratto (1984). A review of these studies by Hayes et al. (1985) cites difficulties in compiling an in-depth sequence for the coastal stretch of Mendocino County due in part to the paucity of comparative information available for the area. However, as a larger marine and intermountain region, a unified chronology is in use that spans southern coast of Oregon down to Cape Mendocino, and from the ocean east into the Klamath-Trinity Mountains.

Literature regarding prehistoric north coast settlement patterns is primarily focused on the entry of diverse groups (Fredrickson 1984). Although Whistler (1979) proposes a sequence based on language, the overall culture between diverse groups in the area is remarkably similar. There is some disagreement among archaeologists over the mode and tempo of cultural evolution on the coast. Some archaeologists are inclined to see all aspects of ethnographic culture as developing together at the same time, while others see cultural evolution on the coast as a mosaic, in which different aspects of the ethnographic pattern developed at different times and at different rates (Ames 1994). Numerous predictive models have emerged in anthropological literature over the years to analyze the validity of both arguments. Current anthropological literature strongly characterizes Northwestern Pacific California settlement patterns to be mosaic in nature.

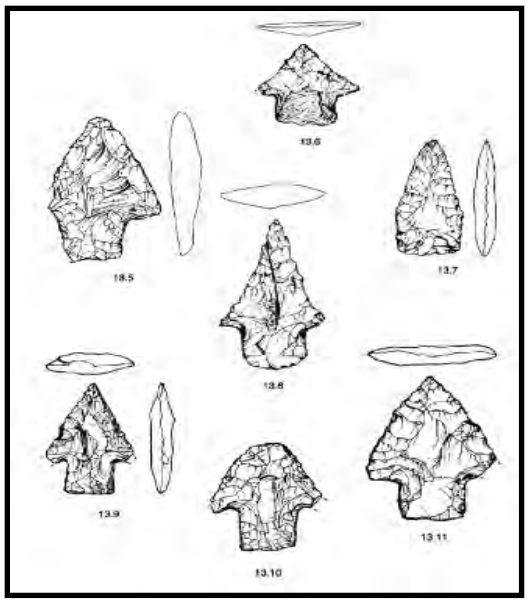

**Figure 3. Borax Wide Stem Type of the Borax Lake Pattern (Figure 13 from Justice 2002: 104).**

The major patterns noted for the region are Borax Lake (10,000 Years Before Present [BP] – 2,800 BP), Mendocino Pattern (2,800 PB – 1,100 BP), and Tuluwat (Gunther) Pattern (1,100 BP – ca. 150 BP).

Following a post-glacial warming trend, Whistler (1979) posits that the earliest migrations of human habitants to the area focused on inland riverine exploits. The earliest pattern, identified as the Borax Lake Pattern, is characterized as highly mobile family groups who utilized hunting and gathering strategies centered on migration and seasonal resources such as elk, acorns, and edible seeds (Eidsness 1988; Hayes et al. 1985). The Borax Lake Site (CA-LAK-36) is the first published archaeological work to identify the Borax Lake Pattern. It was conducted by M. R. Harrington, who claimed that the artifacts of the site were similar in age to the Clovis points found across North America, due to the fluted characteristics of the Borax Lake projectile points. This location is one of the earliest habitation sites in California; possibly as old as 12,000 BP. However, a re-examination of the site conducted by Meighan and Haynes (1968) concluded that the likely earliest dates lie between 10,000 and 8,000 BP (White 1999:9; Greenway 1988:59).

Regionally, the Borax Lake Pattern has been uncovered in the mountains of Humboldt and Mendocino Counties, Santa Rosa Plain, and most prominently in the Clear Lake Basin where assemblages are reflected by flaked stone only (i.e. wide-stemmed points [Figure 1], ovoid flake tools, and bladelet flakes) (Jones & Klar 2007:89). Artifact assemblages comprised hand-stones, milling slabs, and large wide-stemmed spear points made of locally sourced chert or obsidian. In Humboldt and Mendocino areas, obsidian is relatively rare in records from this period. Additional evidence indicates extensive use of high-elevation sites and mountain ridge systems for mobility (Wylie 1976).

Studies from Middle Period sites indicate an adaptation from mobile resource procurement to low elevation semi-permanent villages focused on salmon-bearing streams and acorn exploitation, referred to as the Mendocino Pattern. Storage practices indicate increased sedentism and a shift to bringing

resources back to a central location. This may have been influenced by a climatic shift, cooling the interior of California and resulting in declining food sources at higher elevations (Eidsness 1988; Hildebrandt & Hayes 1983, 1984). Artifact tool assemblages show enhanced diversity comprising spear and atlatl tips, increased use of slab mortars and pestles over hand-stones and milling slabs, and a diminutive refinement of point types (Eidsness 1988). Whistler (1979) suggests this is the period in which the Wiyot settled the coastal strip, indicating the Yurok arrival was nearly 200 years later.

**Figure 4. Tuluwat Pattern distribution (Map 53 from Justice 2002: 417).**

The Tuluwat (formerly known as Gunther) Pattern is set firmly in marine and estuarine practices, reflecting a similarity with greater northwest influences (Eidsness 1988). The pattern is distributed throughout the whole of Northern California and some locations in Southern Oregon (Figure 2). Artifact assemblages are characterized by enhanced woodworking skills (habitations, dugout canoes), steatite bowls and pipes, harpoon points of bone and antler, and the small, distinctive Tuluwat barbs (Eidsness 1988). Exchange networks and measures of religion and wealth are evidenced by dentalium money and large ceremonial obsidian blades, sourced from material nearly 400 kilometers distant (Eidsness 1988; Loud 1918; Hughes 1978). Baskets are a high art form, integrated for all manners of resource procurement, storage, and everyday use. Whistler (1979) credits the firm settlement of the Yurok and Wiyot with the emergence of the Tuluwat pattern and the ability to fully exploit the marine and riverine resources. Excavations show an increased complexity and options in funerary practices including pre-internment grave burning, cremation, and the destruction of personal property (Heizer and Elsasser 1964; Fenega 1968).

## 3.3 Ethnographic Background

Pre-European contact ethnographic information is presented for the Wiyot, the cultural group identified for the project location.

The Wiyot resided in and around the area encompassing the lower Mad and lower Eel rivers, and the estuaries of Humboldt Bay. According to Kroeber (1976: 112), the designation as “Wiyot" actually refers to the lower Eel river area, with proper names for the Humboldt Bay and lower Mad River districts noted as Wiki and Batawat, respectively. Kroeber defines the Wiyot territory as:

> “…just south of Little River, at whose mouth stood the Yurok town of Metsko. On Mad River, near Blue Lake, near the forks, was still Wiyot. The north fork was without villages and is in doubt. The Wiyot owned at least half the lower portion…and the whole of the drainage has been assigned to them. From Mad River south to Eel River Wiyot territory extended to the first range inland. Jacoby, Freshwater, and Salmon Creeks, Elk River and Boynton Prairie were thus Wiyot…On Eel River the boundary came at Eagle Prairie near Rio Dell. Southwest of Eel River, the Bear River Mountains separated the Wiyot from another Athabascan division,

the Mattole. The spurs of this range reach the sea at Cape Fortunas, between Guthrie and oils Creek (1976; 113)".

The traditional territory encompasses approximately 525 square miles (mi), and comprises ocean dunes, riverine and estuarine lands, foot hills, open prairies, and wooded mountains. Loud (1918) estimated the pre-contact aboriginal population to be between 800-1,000 Wiyot between the three districts. Geographically, the location is restrictive and considered culturally insular.

The Wiyot language is a member of the Ritwan group, and linguistically related to the Algonquin language of the Algic family (Golla 2007), which has roots in central and eastern North America (Gruhne 1988). For a complete discussion of structural composition and comparison see Haas (1967), Sapir (1913), and Voegelin (1942); for taxonomy see Haas (1967), Teter (1964), and Michelson (1914); for sociolinguistics see Durbin (1967), Gruhn (1988), and Kinkade & Powell (1976); for dialects and language family see and Frachtenberg (1918), and Dixon & Kroeber (1913). The Wiyot language is currently undergoing a renewal with new research, documentation, and digital interactive language tools.

According to Loud (1918), there were no formal chiefdoms, but instead families of distinction, as designated by their wealth and standing in their districts. For further discussion on geography and migration in relationship to social structure and development see Rogers et al (1990), Milke et al (1949), and Kroeber (1909). For further discussion on cultural development, kinship structures, and burial practices, see Fenega (1968) and Loud (1918).

Like their neighbors, as different resources became available throughout the year, the Wiyot broke into small family bands and traveled to various locations within their territory to fish, hunt, and gather edible and medicinal plants. Subsistence patterns tended to follow both seasonal and socially conscripted routines (Loud 1918). These seasonal rounds took them to outlying areas where they established seasonal base camps and a series of radiating temporary camps and task-related activity stations.

The Wiyot today are represented by one band in each traditional Wiyot District including the Blue Lake Rancheria, Batawat District; the Wiyot Tribe of Table Bluff, Wiki District; and the Bear River Band of the Rohnerville Rancheria. Tribal members still use this area, continue to harvest plant resources, especially for basket resources, and are manifesting a cultural resurgence within their cultural territory (Seidner 1999).

## 3.4 HISTORICAL BACKGROUND

The project area is located along the northern shore of Humboldt Bay and south of the city of Arcata. Humboldt County is closely tied to important themes in California history including early settlement, westward expansion, the Gold Rush, development of the timber industry, and early environmental activism in the City of Arcata.

### 3.4.1 The Arcata Wharf

The following information regarding Arcata's Union Wharf was extracted from Susie Van Kirk's Arcata Marsh History (2015) unless cited otherwise. Van Kirk's (2015: 5) accounting of the recognized need for construction of a commercial wharf is as follows:

> *Union Wharf. The slough did yeoman service, but some Union men saw the limitations of slough freighting and proposed a facility to serve an ocean trade. The town was growing, its merchants*

*busily filing orders for the mines in response to a demand that exceeded any previous time (Humboldt Times 16 Sept. 1854). And another industry was showing its muscle. Within four years of settlement, twenty miles of logging "railroads" were operating around Humboldt Bay where two hundred men were engaged in the woods (Humboldt Times 9 Sept. 1854). It was clear that a shipping facility for goods coming in and lumber going out would stimulate both trades, benefit the town's economy and reward its developers.*

*On November 21, 1854, mill owners Thomas Titlow and Dunbar Averill entered into an agreement with Stillman Daby, Byron Deming and Henry W. Walker, whereby Daby and partners would, within ten months, construct a wharf "from the town of Union to ship channel on Humboldt Bay." Titlow and Averill would advance them $1,500 and provide the construction lumber, consisting of three-inch planks 16 feet long and four-by-four inch scantling. The amount of lumber needed was estimated at 250,000 feet (Recorder's Office, Miscellany A: 29; amended A:31).*

*The wharf company received a Certificate of Incorporation on December 15, 1854. The Union Plank Walk Rail Track and Wharf Company declared its intention to build a walk, track and wharf from the "southwest corner of the public square in the town of Union…and running in a southwesterly direction and in a straight line across the marsh and the flats in Humboldt Bay to the ship channel…for the purpose of transporting freight and passengers over the same and for such other purposes." Incorporated for twenty years, the company had a capital stock of $15,000 divided into 60 shares and there were five directors, including Daby, president and Deming, secretary with Walker, Walter Van Dyke and J.E. Wyman as the remaining directors (Misc. A:23). Before the end of December 1854, the wharf company leased a 30 x 50 foot lot at the northeast corner of Block 153 (present site of the Arcata Post Office) from M.M. Steinthal for the construction of a warehouse, along with a right-of-way over the south half of the block (Misc. A:25).*

*The east and south halves of this block (bounded by 7th, 8th, H and I streets) served as the warehouse and depot location, first for the wharf company, later for the Arcata and Mad River Railroad, and still later as the regional bus depot. Running the track in a "straight line" from the Plaza to the wharf was no exaggeration; the wharf company was definitely committed to the "shortest-distance-between-two-points" principle. From the back of the warehouse block, the track proceeded directly to a ship channel at a 45 degree angle.*

*Crossing the block between 6th and 5th and H and I streets, the line created a pie-shaped parcel that remains today (the Marsh House). An 1887 deed describes the property as bounded on the east by the "roadbed of the Arcata and Mad River Railroad" (Recorder's Office, Deeds 23:448). Never veering an iota, the line headed directly across the marsh and mud flats to its deep-water destination. A 1947 aerial photograph provides one of the best views of that "straight-as-an-arrow" railroad.*

**Figure 5. Aerial view of Union (Arcata) and the Union Wharf circa 1947 (photo by Mel Schuster 1947, reproduced in Van Kirk 2015).**

For further details see Susie Van Kirk's 2005 paper "Arcata Marsh History: Union Wharf, Mad River Canal, Reclamation, Lumber Mills, City Designs."

# 4.0 METHODS

To obtain historical background information, archival research included an examination of multiple sources concerning known archaeological sites, historic properties, and historical activities within and/or adjacent to the APE. Repositories and agencies consulted include the following:

- The California Historical Resources Information System (CHRIS) at Sonoma State University
- The Native American Heritage Commission (NAHC)

## 4.1 NWIC ARCHIVAL RECORD SEARCH RESULTS

A record search request was sent to the CHRIS at Sonoma State University on July 18, 2019. The search included a 0.5-mi radius around the APE for previously recorded archaeological sites and previous surveys (Appendix B).

The following resources were consulted at the Northwest Information Center (NWIC):

- National Register of Historic Places – Listed and Determined eligible Properties (2012)
- California Register of Historical Resources (2012)
- California Points of Historical Interest (2012)
- California Historical Landmarks (2012)

- Directory of Properties in the Historic Property Data Files for Humboldt County (2012)
- Caltrans Local and State Historic Bridge Inventory
- Handbook of North American Indians, Vol. 8, California (1970)
- The Handbook of California Indians (1975)
- City of Arcata Historical Landmarks (South of Samoa Blvd and west of Hwy 101 only)

### 4.1.1 Previously Recorded Cultural Resources within the APE and ESL

The record and literature search revealed no previously recorded cultural resources within the APE, but one resource (site Loud 42) was previously recorded within the ESL (Table 2).

**Table 2. Previously recorded resources within the APE and ESL.**

| Resource Identifier | Resource Description; Date Recorded and by Whom | Source | NRHP/CRHR Status | APE or ESL Location |
|---|---|---|---|---|
| P-12-000100; CA-HUM-00042; Loud 42 | Village site; not occupied in 1850 nor named; Site is believed to be obliterated due to construction of South G Street and Hwy 101 (Loud 1918) | NWIC/ CHRIS | 7 Unevaluated | ESL |
| HUM 101 | Gannon Slough Bridge 4-024L (Caltrans 1986) | SHPO | Ineligible | ESL |
| None | A segment of the Northwest Pacific Railroad (T. Keefe 2006) | Keefe 2006 | 6Z – Determined Not Eligible through field survey | ESL |
| California Historic Landmark #842 | Arcata and Mad River Railroad; Union Wharf and Plank Walk Company (Unknown) | Belcher 1922; Rich 2012 | CHL Listed Resource No. 842 | APE |
| None | H.N. Ry Railroad | Belcher 1922 | Unknown | ESl |
| CA-HUM-001156 | Arcata Bay Levy | HSU-CRF | Unknown | ESL |

Resource P-12-000100 was recorded as a result of Loud's ethnographic survey of the Wiyot. Other than location data, very few details are available from the original site recording.

### 4.1.2 Prior Cultural Resource Studies within the APE and ESL

The record and literature search revealed 10 previous cultural resource studies having been conducted within the APE, and 6 previous studies conducted outside the APE but within the ESL (Table 3).

**Table 3. Previous reports within the ESL.**

| Report Number | Report Title | Date Reported & By Whom | Within APE or ESL |
|---|---|---|---|
| **S-000132** | An Archaeological Survey of the Proposed McKinleyville Sewage Collection and Treatment Facility | David A Fredrickson, Sonia Tamez, and Pamela R. Roberts, 1975 | APE |
| **S-006403** | Archaeological Survey Report for a proposed sewage collection system for Bayside in Arcata, California | Barry Kevin Douglas, 1984 | ESL |
| **S-006669** | Archaeological Survey Report, Butcher's Slough Wetlands Restoration Project, Arcata, California | Barry K. Douglas, 1984 | APE |
| **S-014210** | An Archaeological Investigation of Assessor's Parcel Number 21-184-05, Located in Arcata, Humboldt County, California | James M. Roscoe, 1992 | APE |
| **S-015199** | A Cultural Resources Study of the Proposed Marsh Commons Project, Located in Arcata, California | James Roscoe, 1993 | APE |
| **S-017469** | Historical and Technological Significance of the Humboldt Bay Jetties, Humboldt Bay, California | Carroll W. Pursell, Jr., 1981 | APE |
| **S-022314** | Archaeological Survey for City of Arcata, Janes Creek culvert and Drainage Improvements, FEMA HMGP #1008-6283 (letter report) | David Fukutomi, 1999 | APE |
| **S-029030** | Archaeological Assessment of a 1.5-Acre Parcel (APN 367-180-010), Located at 915 Deer Creek Drive, Martinez, Contra Costa County, California (letter report) | Leigh Martin, 2004 | ESL |
| **S-037718** | A Cultural Resources Investigation of the Proposed McDaniel Slough Marsh Enhancement Project, Located near Arcata, Humboldt County, California | William Rich, James Roscoe, and Susan Van Kirk, 2003 | APE |
| **S-038304** | Historic Property Survey Report for the Proposed Eureka-Arcata Corridor Projects on California State Highway 101 at Post Mile 79.9/86.3 in Humboldt County, California | Timothy Keefe, 2006 | ESL |

| Report Number | Report Title | Date Reported & By Whom | Within APE or ESL |
|---|---|---|---|
| **S-038434** | Archaeological Inventory and Evaluation for the Wal-Mart Mitigation at the Old Lynch Canyon Homestead Project, Solano County, California | Charlane Gross and Jason Coleman, 2011 | APE |
| **S-040249** | Cultural Resources Survey Report for the South G Street (Christie) WRP Project, Humboldt County, California | Jason A. Coleman | ESL |
| **S-041725** | A Cultural Resources Investigation of the Daylighting of Jolly Giant Creek Project, located in Humboldt County, California | Nick Angeloff and James Roscoe, 2004 | ESL |
| **S-041786** | Historic Property Survey, Archaeological Survey, and Historical Resources Evaluation Reports, Highway 255 Gateway Improvements, CALTRANS District 1, Humboldt County, CA | Leslie S. Heald, 2002 | ESL |
| **S-048287** | A Cultural Resources Investigation of three Coastal Access Points for the Humboldt Bay Water Trails Implementation Program, Located in Humboldt County, California | James Roscoe and William Rich, 2012 | APE |
| **S-050908** | A Cultural Resources Investigation of the Arcata Wastewater Inflow and Infiltration Project, Arcata, Humboldt County, California | Nick Angeloff and Lynette Mullen, 2016 | APE |

The 1975 cultural resources study by Sonoma State's David Fredrickson, Sonia Tamez, and Pamela R. Roberts (Report number S-000132; Fredrickson et al., 1975) included work in the project APE. This study encompassed 3,660 acres and 25.5 linear miles and identified four cultural resources. However, none of these resources were identified within the ESL of this project.

Barry Kevin Douglas conducted two cultural resources studies in 1984, one within the APE (S-006669) and one within the ESL (S-006403). Report S-006403 describes a survey completed for installation of a sewage collection system for Bayside Arcata (Douglas 1984A), while report S-006669 details a 30 ac wetlands restoration project within the APE. One cultural resource was identified as a result of this investigation, site Loud 42 (P-12-000100), which is located within the project APE (Douglas 1984B).

James M. Roscoe and associates conducted five cultural investigations in the area during the 1990s and early 2000s. Report S-014210 details a cultural resources study that was completed for a 0.3 ac accessor's parcel, on which no cultural resources were identified (Roscoe 1992). Report S-015199 details a cultural resources study that was completed for a Marsh Commons project consisting of 1.5 ac, in which no cultural resources were identified as a result for this investigation (Roscoe 1993). Roscoe along with

William Rich and Susie Van Kirk conducted a cultural resources study for the proposed Slough Marsh Enhancement project in Arcata, in which three cultural resources were identified. Loud 42 (P-12-000100) was noted within the project APE (Roscoe et al 2003). Report S-041725 details a cultural resources study that was completed by Humboldt State University, in which no cultural resources were identified (Angeloff and Roscoe 2004). Report S-048287 details a cultural resources study that was completed for implementation of Humboldt Bay Water trails. No cultural resources were identified as a result of this investigation (Roscoe and Rich 2012).

Report S-017460 details a cultural resources study that was completed for determination of historical significance of the Humboldt Bay Jetties, in which no cultural resources were identified (Pursell 1981). Report S-022314 details a cultural resources study that was completed for drainage and Culvert Improvements for FEMA work in Arcata. No cultural resources were identified as a result of this investigation, neither of which are within the project's ESL (Fukutomi 1999). Report S-029030 details a cultural resources study that was completed for 1.0 ac accessor's parcel, in which no cultural resources were identified (Martin 2004). Report S-050908 details a cultural resources study that was completed for the Arcata Wastewater Inflow and Infiltration project, in which twenty-nine cultural resources were identified. Loud 42 (P-12-000100) is the only cultural resource identified within the APE (Angeloff and Mullen 2016).

Report S-038434 describes the cultural resources study completed for an inventory and evaluation of the Old Lynch Canyon Homestead. A single cultural resource was identified, which is located outside the project's ESL (Gross and Coleman, 2011). Coleman also conducted a cultural resources study for the South G Street WRP project, in which no cultural resources were identified (Coleman 2013).

Caltrans completed two cultural resources studies in the area during the early 2000s. Report S-038304 (Keefe 006) details a cultural resources study that was completed along 4.5 linear miles for the proposed Eureka-Arcata corridor along California State Highway 101. Eleven cultural resources were identified as a result of this investigation, but all are located outside of this project's ESL. However, this report also determined that the Arcata Wastewater Treatment plant was found Ineligible for inclusion in the National Register at that time. Report S-041786 (Heald 2002) describes the cultural resources study completed for Highway 255 Gateway improvements. Seventeen cultural resources were identified as a result of this investigation, but none within this project's ESL (Heald 2002).

## 4.2 Native American Coordination

In accordance with PRC § 5097.91-5097-94, the Native American Heritage Commission (NAHC) maintains a catalog pertaining to places of special religious or social significance to Native Americans. In order to identify if places of religious or social significance exist within the APE, DZC contacted the NAHC on August 30, 2019 to request a review of their Sacred Lands Files.

The NAHC responded by email on September 19, 2019, stating that the Sacred Lands File search was negative and provided a list of individuals to be contacted regarding the project.

PRC § 21080.3.1, subd. (b), declares that California Native American Tribes traditionally and culturally affiliated with a geographic area may have expertise concerning their tribal cultural resources. As such, DZC contacted persons on the designated contact list maintained by the NAHC, providing each with a

project description, location map, a request to respond to DZC with any relevant information, and a request to respond to the lead agency within 30 days, should the tribe wish to engage in formal government-to-government Consultation. Email or hard-copy notifications were sent to all parties on the NAHC list on October 10, 2019.

Janet Eidsness, THPO of Blue Lake Rancheria responded on October 11, 2019. THPO Eisdness acknowledged the proximity of P-12-000042 (CA-HUM-00042/Loud 42) within the ESL, concurred that the resource is outside of the APE, and offered that Blue Lake Rancheria had no knowledge of any additional sites in the APE.

As of October 31, 2019, no response was received from (1) Bear River Band of the Rohnerville Rancheria: Barry Brenard, Chairperson; Celeste Ruiz, Executive Secretary; and Erika Cooper, THPO; (2) Cher-Ae-Heights Indian Community of the Trinidad Rancheria: Claudia Brundin and Garth Sundberg, Sr., Chairpersons; and (3) Wiyot Tribe: Ted Hernandez, Chairperson.

Formal government-to-government Consultation, as defined by PRC § 21080.3.1 (a), is the purview of the lead agency, the City of Arcata. Records pertaining to formal consultation are on file with the City of Arcata. All correspondence regarding Native American coordination conducted by DZC is included in Appendix C.

## 4.3 Parcel Specific History

The following sections detail initial land ownership and development of the APE utilizing public records and historical maps, followed by an analysis of topographic maps, aerial photographs, and satellite imagery.

### 4.3.1 Initial Land Ownership and Development

The historic map review included analysis of the A. J. Doolittle Map (1865), the Stanley Forbes Company map (1886), the J.N. Lentell map (1914), and the Belcher Abstract & Title Company map (1922).

The A. J. Doolittle (1865) indicates that the APE and surrounding area had been moderately surveyed by 1865. The depiction of Northern Bay has several noted landmarks surrounding the APE, but not within the APE. The majority of the project area was historically a marsh. Along the immediate western boundary of the APE, a railroad extends into Humboldt Bay. Although it is unclear on Doolittle's map if it overlaps the APE, the landowner along the

**Figure 6. Northeastern shore of Humboldt Bay circa 1865 (Doolittle 1865).**

marsh boundary is “Phillips” (Doolittle 1865).

The Hickey and Standish (1895) map does not indicate a landowner for the APE in 1895. The J.N. Lentell (1914) map does not indicate a landowner for the APE in 1914. However, two railroad lines are depicted as extending through the APE and ESL including a segment of the Arcata and Mad River Railroad (Union Wharf and Plank Walk Company, California Historic Landmark No.842) and a segment of the Northwestern Pacific Railroad.

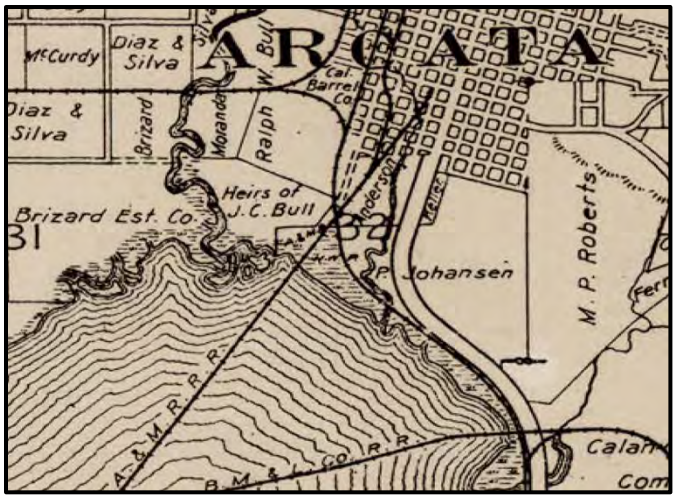

**Figure 7. Northeastern shore of Humboldt Bay circa 1922 (Belcher Abstract Title Company).**

The Belcher Abstract & Title Company map (1922) depicts several landowners along the northern shore of Humboldt Bay associated with the APE. The Annie and Mary Railroad owned property directly on the shore of Humboldt Bay and owned the railroad line that extended northeast-southwest into the Bay (Union Wharf and Plank Walk Company, California Historic Landmark No.842). A segment of the Northwestern Pacific Railroad is also depicted within the APE and ESL. Neighboring landowners in or near the APE included Heirs of J.C. Bull, Ralph W. Bull, and P. Johansen.

See Appendix D for the approximate location of the APE on these historical maps.

A state volume patent and a serial patent were issued for the APE the 19th and 20th century. Below is a table detailing state volume patents and serial patents within the project’s APE and ESL (Table 4). Historical documents regarding the development of the APE and ESL are included in Appendix D.

**Table 4. State volume patents and serial patents within the project APE and ESL.**

| Name | Date | Quadrant | Township/Range/Section | GLO Source | Project Segment overlap |
|---|---|---|---|---|---|
| State of California | January 12, 1903 | Arcata South | T6N/R1E/ Section 32 | Serial Patent; GLO 1903 | Study Unit 1, 2, 3, 4, and 5 |
| Marc Teremater | November 11, 1867 | Arcata South | T6N/R1E/ Section 32 | State Volume Patent; GLO 1867 | Study Unit 1 |

### 4.3.2 APE Parcel Specific Topographic Maps and Aerial Photographs

Utilizing the National Environmental Title Research (NETR) website, DZC reviewed the USGS topographic maps of the APE and ESL. The USGS maps are hereby referred to as NETR (1933, 1942, 1948, 1953, 1961,

1966, 1972B, 1974, 2012B, 2015) and encompasses Arcata South 7.5-minute quadrangle map Township 6 North, Range 1 East, Section 32 and Township 5 North, Range 1 East, Unsectioned and all four previously designated polygons pertaining to the APE (Table 1).

In 1933, two prominent linear landmarks are demarcated on the historical topographic map while the majority of the APE is designated as marshland. The Arcata and Mad River Railroad line or wharf runs in a northeast-southwest direction along the APE's northwestern boundary. The Redwood Northwestern Highway is adjacent to the APEs eastern boundary. A clearly delineated grid system is established in Arcata and is featured within the projects northern ESL (USGS 1933). Between 1948 and 1953, three buildings are constructed adjacent to Study Unit 1 and three ponds, designated as reservoir, are established near Study Unit 1 and 2, but within the ESL (USGS 1948, 1953). By 1961, the "Oxidation Pool", which encompasses the southern portion of the APEs Unit 5, is established. Two of the three ponds built between 1948 and 1953 are merged into one pond by 1961 (USGS 1961). Just five years later in 1966, several buildings are constructed on the eastern side of the Redwood Highway within the ESL as well as a Radio Tower. Within the APE, the Oxidation Pond, previously built facilities, and two smaller ponds are labeled Sewage Disposal (USGS 1966).

Between 1972 and 1974, the northern portion of Study Unit 5 is no longer labeled as marshland and has a clear boundary around what will eventually become Klopp Lake. The previously labeled Arcata and Mad River Railroad line is labeled Wharf (Ruins) by this time and part of the railroad along the APEs eastern boundary is labeled Northwestern Pacific Railroad (USGS 1972B, 1974). In 2012, the area encompassing the northern portion of Study Unit 5 is labeled Jolly Giant C and is situated between roads Marina W. and South G St, which are within the western and eastern portion of the ESL (USGS 2012). By 2015, no significant changes are demarcated except a large pond, which is located in the northern portion of Study Unit 5 (USGS 2015).

DZC also examined aerial photos of the APE from the NETR website (1956, 1972A, 1989, 1993, 2005, 2009, 2010, 2012A, 2014, 2016). The earliest aerial photographs of the area, from 1956, are poor quality. What can be demarcated on the landscape shows that Study Unit 5 is a combination of marshland, mud, and vegetation. A single structure is located between Study Units 2 and 5 within the ESL (USGS 1956). By 1972, all of the ponds within the APE, including the Oxidation Pond, are clearly demarcated on the landscape as well as some smaller buildings near Study Unit 2 and a few dirt roads, but none of which are well developed (USGS 1972A). By 1989, the APE and surrounding area are far more established as evidenced by clear pond designations and buildings, which are concentrated near Study Units 3 and 5. The Oxidation pond has also been internally divided into 13 rectangular polygons (USGS 1989). No significant changes occur within the APE or ESL until 2016, in which green vegetation becomes more prominent in the surrounding ESL (USGS 2010, 2012A, 2014, 2016).

Satellite imagery from Google (2016) indicates that several of the ponds have designated names. Within Study Unit 2 is east of the South G Street Storm Water Pond, Study Unit 3 is located adjacent to No-name Pond, and Study Unit 5's southern portion is designated as North Oxidation Pond and South Oxidation Pond. Study Unit 5's northern portion encompasses Hauser Marsh along South I St. and Gearheart Marsh. Several structures are located within the ESL east of South G St (Google 2016).

### 4.3.3 THE ARCATA MARSH - ENVIRONMENTAL INNOVATION

The following summary of the social justice aspects and physical processes of the AWTF is summarized from a manuscript written by Amanda Suutari, published in June 2006.

In 1972, Federal Water Pollution Control Act Amendments called for the improvement of the water quality in Humboldt Bay and at that time, Arcata's former wastewater treatment plant was not adequately treating the city's wastewater. Originally constructed in the 1940s, wastewater discharged into the bay from the treatment plant received only primary treatment. The facilities were expanded in 1958, which increased the level of treatment by adding chlorination. However, by 1974 these processes were not only deemed inadequate by the standards of the Water Pollution Control Act Amendments of 1972 but were also becoming socially unacceptable when considering sustainable fisheries and other aquatic life. By 1974, the City of Arcata and its community entered into the "Wastewater Wars" when the State and Regional Governments proposed a wastewater treatment plant that would serve Arcata as well as other areas on the bay, a project that would make the rural region vulnerable to strip development and increased sewage disposal costs.

In the spirit of local activism, community members had recently created the first Community owned forest in the country and prevented a new federal freeway from further bisecting their town. Riding that wave with the backing of local notables including Dr. George Allen, Dr. Robert Gearheart, Dan Hauser, and Franklin Klopp, the citizenry focused on creating the Arcata Marsh and Wildfire Sanctuary and proving to State and federal government agencies that the facility's wastewater would "enhance" the bay (Esther Scott et. al. 1989). The overall goal was to remove the remnants of the derelict lumber mill and associated ponds, compromised concrete foundations, and the unkempt landfill and replace it with the wastewater treatment plant that would remain independent while providing wildlife habitat and recreational opportunities. Primary processes included industrial remediation by the National Guard, installation of temporary dikes, sediment removal, terraforming, and native plant revegetation.

The resulting infrastructure currently supports primary treatment, which separates liquids from solids, and secondary treatment, which addresses harmful pathogens. Major components include the headworks, primary clarification retention facilities, digesters, oxidation ponds, treatment marshes, and disinfection prior to final discharge into enhancement marshes.

The initial AWTF was completed in 1986 with subsequent expansions of 3.51 ac funded by the California State Coastal Conservancy and the addition of the Arcara Marsh Interpretive Center in 1993. The marsh complex today is internationally renowned as a first-class example of an innovative, cost effective, environmentally integrated facility.

For further details regarding the historic, political and industrial processes surrounding the formation of the AWTF, the reader is referred to the full publication by Amanda Suuti, included in Appendix D.

## 4.4 GEOARCHAEOLOGICAL RESEARCH

To assess the potential for buried archaeological sites within the proposed project components, this assessment considers factors that either encourage or discourage human use or occupation of certain landforms (e.g., geomorphic setting and distance to water), combined with those that affected the subsequent preservation (i.e., erosion or burial) of those landforms. It is well-known, for instance, that

prehistoric archaeological sites in California are most often found on relatively level landforms near natural water sources (e.g., springs, streams, rivers, or estuaries), which is often where two or more environmental zones (ecotones) are present. Landforms with this combination of variables are frequently found at or near the contact between a floodplain and a higher and older geomorphic surface, such as an alluvial fan or stream terrace (Hanson 2004:5).

An attempt is given to forecast the burial sensitivity by looking at the intersection of existing geomorphic, stratigraphic, soils spatial variables, land use, and past impacts as well as any behavioral variables that may forecast human occupation. The following describes the project site in terms of these variables and generates an archaeological sensitivity forecast. This is not an analysis of whether a particular area was attractive for human activity, but whether the conditions are favorable for buried archaeological deposits.

Soil Composition

A review of the USDA Soil Survey Geographic Database Soil Series for Humboldt County, California (CA600) revealed that 92% of the APE consists predominantly of Miscellaneous Water and Water. The remainder includes Urban land-Anthraltic Xerorthents association (0-2% slopes), and Hydraquents (0-3% slopes) (USDA 2019). Together with water dominating the majority of the APE, these two soil families represent 8% of soils found in the APE.

The Urban land-Anthraltic Xerorthents soil type is found in the central part of the APE and is associated with Fluviomarine terraces and backslopes. The parent material consists of coarse-loamy fluviomarine deposits and/or coarse-loamy dredge spoils (USDA 2019). Depth to the water table is roughly 24 in. and this class is moderately well-drained. Water movement in the most restrictive layer is high (ibid.). A typical soil profile for this soil type reads 1.) 0-6 in.: gravely loam fine sand; 2.) 6-31 in.: sandy loam; 3.) 31-43 in.: gravelly sand; and 4.) 43-65 in.: sand (ibid.).

The Hydraquents-Wassents soil type is found the central and western portion of the APE and is associated with tidal flats. The parent material consists of mucky, silty, and clayey estuarine deposits (ibid.). Depth to restrictive layer is 0 in. to aslic and 20 to 79 in. to sulfuric and this class is very poorly drained. The depth to water table is about 0 inches (ibid.). A typical soil profile for this soil type reads 1.) 0-59 in.: mucky silty clay loam (ibid).

These two soil profiles together form approximately 100 percent of the recorded surface in the APE that is not water. Within the APE, Meyer's predictive model (Meyer et al. 2013:102) for surface deposit potential in the aquatic terrain is moderately high to high based on favorable distance to water, low elevations below 4,000 ft, 0- to 3-degree slopes, proximity to waterways confluences, and slightly convex or concave landforms. The age of the two soil types present, which are Urban land-Anthraltic Xerorthents and Hydraquents-Wassents, is recent (Meyer et al. 2013, Appendix B).

### 4.4.1 HYDROLOGY OF THE ESL

With reference to the USGS 7.5-minute Topographic Map, Arcata South (1959), the directional groundwater flow through the APE is westward towards the Pacific Ocean. The Federal Emergency Management Agency national flood hazard map does indicate the APE to be within the path of a 100-year flood event (FEMA 2016).

### 4.5 Cultural Resource Survey Expectations

The results of archival research, the Sacred Lands Search, previous surveys adjacent to and within the study area, and the environmental context all contribute to an assessment of the sensitivity level for a given project area. Based on the geomorphological and topographic characteristics of the project area, the results of the records and literature search, the age the soils mapped in the area, and the level of historic disturbance, the APE is considered to have a low potential for buried and surficial prehistoric resources, a moderate potential for buried historic resources, and a low potential for surficial historic resources.

## 5.0 Report of Findings

### 5.1 Archaeological Survey Results

DZC conducted the archaeological survey of the APE on October 9, 2019 and on November 5, 2019. Within the APE, designated project Study Units 1-5 were targeted for archaeological survey coverage, which includes Staging Areas 1-4 (Appendix A, Figure A-7). The City of Arcata identified 123 ac of land for Intensive survey.

The primary constraint to survey efforts was poor ground visibility. Generally, ground visibility was less than five percent since most surfaces were either paved, vegetated, or covered with imported gravel. To circumvent this, vegetation was scraped clear at select intervals to obtain a clear view of the mineral surface. This method was employed in other areas within the APE where low-lying and dense vegetation was present. Some soils were occasionally visible because of gopher holes and occasional bare patches of ground without vegetation cover. The soils observed varied greatly and included light sandy loam, dark loam aggregated rounded and subangular cobbles associated with commercial imported gravels. Fragmentary refuse, including crushed cement tailings and modern broken glass, were observed but not in sufficient quantities to obtain interpretive data aside from industrial use association.

In Staging Area 1 poor visibility was due to low-lying dense vegetation and surfaces covered with imported gravel. Staging Area 2 provided similar constraints to survey efforts with poor visibility due to paved asphalt and low dense vegetation surrounding the Arcata Marsh Parking lot on South G Street. Constraints of Staging Area 3 included the presence of low dense vegetation, briars, and imported gravels. Staging area 4 constraints were similar to those of Staging Area 2, with paved asphalt and low dense vegetation surrounding the Arcata Marsh Parking lot on South I Street.

Pedestrian survey efforts resulted in 100% coverage of the target acres excluding wetlands, ponds and marshes, and provided intensive coverage in transects of 15 m or less for all acres covered (Appendix A, Figure A-7 Survey Coverage and Results).

The survey was negative for precontact resources. Two built environment features were identified within the APE including the AWTF and a remnants of the Arcata Mad River Railroad/Union Wharf and Plank Walk Company.

# 6.0 RESOURCE DISCUSSION

## 6.1 RESOURCE EVALUATION CRITERIA

### 6.1.1 NATIONAL REGISTER OF HISTORIC PLACES

To be eligible for listing on the National Register, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Districts, sites, buildings, structures, and objects of potential significance must meet one or more of the following four established criteria:

- Criterion A - Are associated with events that have made a significant contribution to the broad patterns of our history;
- Criterion B - Are associated with the lives of persons significant to our past;
- Criterion C - Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master; or that possess high artistic values; or that represent a significant and distinguishable entity whose components may lack individual distinction;
- Criterion D - Have yielded, or may be likely to yield, information important in prehistory or history.

In addition to meeting one or more of the above criteria, a resource must retain integrity to be considered eligible for listing on the NRHP. Integrity is the authenticity of the physical identity that is evidenced by the survival of characteristics that existed during the resource's period of significance. The seven aspects of integrity are outlined in the National Register Bulletin No. 15 and consist of: location, design, setting, materials, workmanship, feeling, and association (Shrimpton 2002). Resources must retain enough of their character or appearance to be recognizable as resources and to convey the reasons for their significance. Further, unless the resource possesses exceptional significance, it generally must be at least 50 years old to be eligible for National Register listing.

Section 101(d)(6)(A) of the National Historic Preservation Act (NHPA) allows properties of traditional religious and cultural importance to a Native American tribe to be determined eligible for NRHP inclusion. In addition, a broader range of Traditional Cultural Properties (TCPs) is also considered and may be determined eligible for or listed in the NRHP. A TCP is a property associated with the cultural practices or beliefs of a living community; TCPs are rooted in that community's history and are important in maintaining the continuing cultural identity of the community. In the NRHP programs, "culture" is understood to mean the traditions, beliefs, practices, lifeways, arts, crafts, and social institutions of any community, be it a Native American tribe, a local ethnic group, or the nation as a whole.

### 6.1.2 CALIFORNIA REGISTER OF HISTORICAL RESOURCES

As provided in California Public Resources Code Section 5020.4, the California Legislature established the CRHR in 1992. The CRHR is used as a guide by state and local agencies, private groups, and citizens to identify the state historical resources and properties to be protected, to the extent prudent and feasible, from substantial adverse change. The CRHR automatically includes all California properties already listed in the NRHP and those formally determined to be eligible for listing in the NRHP. The CRHR may also include various other types of historical resources that meet the criteria for eligibility, including the following:

- Individual historic resources
- Resources that contribute to a historic district

- Resources identified as significant in historic resource surveys
- Resources with a significance rating of Category 3 through Category 5 in the State Inventory (Categories 3 and 4 refer to potential eligibility for the NRHP; Category 5 indicates a property with local significance)

The CRHR follows the lead of the NRHP in utilizing the 50-year threshold: a resource is usually considered for its historical significance only after it reaches the age of 50 years. This threshold is not absolute, but was selected as a reasonable span of time after which a professional evaluation of historical value/importance should be made. The criteria for listing resources in the CRHR were expressly developed to be in accordance with previously established criteria developed for listing on the NRHP.

Section 15064.5(a)(3) of the CEQA Guidelines states that "Generally, a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources," which are as follow:

- Criterion 1 - Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
- Criterion 2 - Is associated with lives of persons important in our past;
- Criterion 3 - Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- Criterion 4 - Has yielded, or may be likely to yield, information important in prehistory or history.

Using the information outlined above, the first level of evaluation is to determine whether a resource is considered eligible for the CRHR and is, therefore, significant. Significance, in part, is determined based on a historical resource's integrity. Integrity in the context of the CRHR means a resource is sufficiently intact to yield important information regarding the past. Integrity encompasses the following factors: location, setting, design, materials, workmanship, association, and feeling.

## 6.2 Resource Evaluation

### 6.2.1 AWTF Infrastructure

The AWTF was initially constructed in the 1940s with various parts of the system being replaced or improved multiples times since that time. With respect to the AWTF's cultural significance, wastewater treatment facilities are ubiquitous features found in most cities and towns. No evidence has been found to suggest that the initial construction and materials used in the AWTF are in any way unique. Further, ongoing repairs and maintenance continue to upgrade and improve the design, workmanship, and material qualities of the original construction. However the expansion of the AWTF in 1986 may represent both an innovative design, which may be considered a unique construction method, and social justice activism associated with the City of Arcata. As such, this discussion regarding the criteria for evaluation aims to identify persons and events relative to the AWTF.

NEPA and CEQA mandate that resources older than 50 years may qualify for eligibility on the National Register of Historic Places or the California Register of Historic Resources.

A/1: AWTF was originally constructed in in the 1940s in order to facilitate wastewater disposal for the City of Arcata. Since that time, it has undergone multiple modifications and improvements, however the processes remain true to the original idea. Wastewater treatment plants are ubiquitous facilities found throughout most towns and cities. However, research has shown that the AWTF is associated with significant local events of environmental activism. Projects occurring within the AWTF post-2036 should consider evaluation of the facility for the NRHP/CRHR.

B/2: Research has shown four figures of historical significance to be related to the construction of the AWTF or its operation. Dr. George Allen, professor and Fisheries Sciences at Humboldt State University; Dr. Robert Gearheart, professor of Environmental Engineering at Humboldt State University; Mr. Dan Hauser, City Council Member and Mayor of the City of Arcata from 1974-1982; and Mr. Frank Klopp, City Engineer since 1968 and Director of Public Works. These individuals were part of the seminal force for the formation of the water treatment plant and several ponds and marshes within the AWTF are named in their honor. Subsequent evaluation efforts warrant further investigation into the roles and responsibilities these individuals had into the formation of the AWTF.

C/3: The materials and construction of the AWTF is considered typical. The treatment plant does not embody a distinctive characteristic of a type, period, or method of construction, does not represent the work of a master; does not possess high artistic values. However, upon reaching the threshold for evaluation in 2036, the facility may represent a significant and distinguishable entity whose components may exhibit engineering distinction.

D/4: The AWTF is regularly maintained and is currently used for treating wastewater derived from within and near the city limits. This facility is unlikely to yield information important in prehistory or history.

NEPA and CEQA mandate that resources older than 50 years may qualify for eligibility on the National Register of Historic Places or the California Register of Historic Resources. Although the plant does not currently meet the age threshold for evaluation consideration, projects undertaken after 2036 may require formal evaluation of the AWTF.

In 2006, Tim Keefe (Senior Environmental Planner and Archaeologist/Caltrans, District 1) determined the AWTF as Ineligible for inclusion in the National Register. This assessment still stands and no additional information value is expected to be provided by facility at this time.

### 6.2.2 Arcata and Mad River Railroad/union Wharf and Plank Walk Company – California Historic Landmark No. 842 (CHL 842)

The background literature review and historic photo analysis revealed that the historic alignment of the Arcata Mad River Railroad - Union Plank Walk and Wharf Company, California's first organized railroad (formally designated CHL 842) built circa 1855, traverses Study Units 1 and 4. The review also indicated that Study Unit 1/Staging area 1 underwent major remediation to remove industrial contaminants and structures. The remediation efforts, along with the construction of the Arcata Marsh, resulted in the removal of all terrestrial features associated with CHL 842 formerly within the APE. The remnant pilings of CHL 842 are located in the waters of Humboldt Bay, outside of the APE.

As a California Historic Landmark Listed resource, no further evaluation is warranted at this time.

As Study Area 1/Staging Area retains no remnants of CHL 842, and Staging Area 4 is completely paved over, this study determines that current Project plans to use these areas for the temporary staging of equipment and materials has no potential to impair any aspect of the historic significance of CHL 842.

# 7.0 Recommendations and Conclusions

## 7.1 CEQA - Finding of No Impacts

CEQA aims to "develop and maintain a high-quality environment now and in the future, and take all action to protect, rehabilitate, and enhance the environmental quality of the state (PRC § 21001)". Historical and tribal cultural resources are part of the environment and as such, a project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment.

One historical property alignment is mapped within the APE (CHL #842). The portion of the property within the APE is limited to a mapped alignment and as such retains no physical remnants within the APE. The remaining physical features associated with CHL #842 are located outside of the APE. Additionally, Project activities in the vicinity of the mapped alignment will not cause sub-surface disturbances. Therefore, this study concludes a **Finding of No Impacts** to historic resources as defined by PRC § 5024.1, Title 14 CCR, Section 482.

## 7.2 NEPA – Finding of No Effects to Historic Properties

This Project is funded in part by State Revolving Funds Program. As such, the project is considered a Federal undertaking and is subject to NEPA and NHPA (as amended, 16 United States Code [USC] 470f). Cultural resources are considered during federal undertakings under Section 106 of NHPA, through its implementing regulations at 36 CFR 800 (Protection of Historic Properties).

One significant historic property alignment is mapped within the APE (CHL #842). The portion of the property within the APE is limited to a mapped alignment and as such retains no physical remnants within the APE. The remaining physical features associated with CHL #842 are located outside of the APE. Additionally, Project activities in the vicinity of the mapped alignment will not cause sub-surface disturbances. Therefore, this study concludes a **Finding of No Effects** to Historic Properties as defined by 36 CFR 800.16 (i).

## 7.3 Native American Consultation & Coordination

As a result of initiating a Sacred Land File & Native American Contacts List Request with the NAHC, DZC has contacted the tribes identified with the APE requesting knowledge of, or concerns for, cultural resources within the APE and Project vicinity.

Communications with, and responses from, the Native American community are included in Appendix B.

The outreach conducted by DZC may be considered Native American coordination. Coordination seeks to solicit information, build partnerships, and identify if and when formal Consultation is needed. Coordination does not substitute for Native American Consultation as defined by Section 106 of the NHPA, which requires government-to-government communications between tribal entities and the Lead Agency.

As the Lead Agency, it is the responsibility of the City of Arcata to formally engage in Consultation with the APE affiliated cultural groups.

## 7.4 Management Considerations

DZC recommends the project proceed with the following stipulations, which should be included on all project plans:

1. It is best practice to avoid cultural resources whenever possible. In cases of inadvertent (unplanned) discovery of cultural resources or human remains, the following procedures are required:
    a. If buried cultural materials are encountered during construction, it is required that work stop in that area until a qualified archaeologist can evaluate the nature and significance of the find [CCR 15064.5(f)].
    b. Immediately notify a qualified archaeologist to evaluate the nature and significance of the find [36 CFR 800.13]. A local archaeologist may be contacted at:

DZC Archaeology and Cultural Resource Consulting, LLC
445 I Street, Suite 204
Arcata, CA. 95521
707-599-9842
dimitra@dzcarc.com

2. If human remains are encountered during future construction, it is required that work stop immediately in that area and notification be made to the Humboldt County Coroner (CCR 15064.5(e) (1) (A); HSC Sec.7050.5).
3. Contact information for the Chief Deputy Coroner office at the time of this report:

Ernest Stewart
Humboldt County Chief Deputy Coroner
3012 I Street, Eureka, CA. 95501
Phone: 707-445-7242

4. If the coroner determines the remains to Native American, the Coroner shall contact the NAHC within 24 hours and collaboratively determine the Most Likely Descendant (CCR 15064.5(e)(1)(B)

The information and results contained in this document are based on the existing information provided to the archaeological firm as of August 29, 2019. Additional survey will be required if the project changes to include areas not previously surveyed.

RE: Arcata Wastewater Treatment Facility Improvements, Humboldt County.

Dear Ms. Zalarvis-Chase:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information. If you have any questions or need additional information, please contact me at my email address: katy.sanchez@nahc.ca.gov.

Sincerely,

Katy Sanchez

KATY SANCHEZ
Associate Environmental Planner

Dimitra Zalarvis-Chase
DZC Archaeology & Cultural Resource Consulting

VIA Email to: Dimitrazc@gmail.com

RE: Northern Realm, Humboldt County.

Dear Ms. Zalarvis-Chase:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information. If you have any questions or need additional information, please contact me at my email address: katy.sanchez@nahc.ca.gov.

Sincerely,

Katy Sanchez

***REQUEST FOR COMMENT***

**TO:** Barry Brenard, Chairperson, Celeste Ruiz, Executive Secretary, and Erika Cooper, THPO, Bear River Band of the Rohnerville Rancheria
Claudia Brundin, Chairperson, Janet Eidsness, THPO, and Jacob Pounds, Assistant THPO, Blue Lake Rancheria,
Garth Sundberg, Sr., Chairperson, Cher-Ae-Heights Indian Community of the Trinidad Rancheria
Ted Hernandez, Chairperson, Wiyot Tribe

**FROM:** Dimitra Zalarvis-Chase, Archaeologist

**EMAIL:** dimitrazc@gmail.com

**PHONE:** (707) 599-9842

**PROPOSED PROJECT:** Arcata Wastewater Treatment Facilities Improvements

**SITE LOCATION:** Arcata South 7.5-Minute Quad; T6N, R1E, Section 32

**SITE SIZE:** 295 ± acres

DZC Archaeology and CRM Consulting is conducting the necessary records search and comment solicitation pursuant to the California Environmental Quality Act, and AB 52.

The proposed project is to improve the Arcata Wastewater Treatment Facilities infrastructure with the addition of a new secondary treatment system.

We would appreciate any information you could provide regarding known cultural resources in the project vicinity. If we have not received a response within 30 days from the date of this letter, we will assume you have no concerns or information to provide.

If this project is outside of your tribal area of sensitivity, please **also** contact the Native American Heritage Commission to refine your area of concern and avoid unwanted project notifications.

Thank you for your assistance.
Dimitra Zalarvis-Chase

## How a vicious cycle can become virtuous

### by Amanda Suutari and Gerald Marten

The cicadas are in full voice on a sultry morning in May as we make our way along a rickety wooden boardwalk that snakes through a community mangrove forest near Thung Dase village in southern Thailand. The mangroves offer welcome shade near a dock where a small boat is moored. Handmade bamboo traps are set to catch mud crabs when the tides go out. In a flash of orange and turquoise, a kingfisher swoops to a low-hanging branch.

It's hard to imagine that three decades ago the area's lush abundance was collapsing into a wasteland. "At one time," recalls Nom Ham Yak, chair of the forest's management committee, "our economic base was crabs, fisheries, and rubber. Then areas were leased as concessions to private contractors to clear for charcoal, and the forest became badly degraded."

The prospects for the area's villages were so bleak that a revival would have seemed a fantasy. What brought them back from the brink was an Eco Tipping Point.

Eco Tipping Points offer a new paradigm for restoring our communities, both natural and human. Conventional approaches to ecological problems – from piecemeal micromanagement, to techno-fixes, to top-down regulation – often fail or generate new messes. But Eco Tipping Points show how the same forces that endanger environments and communities can be harnessed to heal them.

To demonstrate what Eco Tipping Points are and how they work, consider two very different stories from two continents: the mangrove forests of Trang Province and the marshes of Arcata, California.

## From charcoal to pink gold

Five hundred thirty-five miles south of Bangkok, Trang Province is located on Thailand's southwest coast at the western shore of the Andaman Sea. Thung Dase and its neighboring villages lie in the watershed of the Palian and Trang Rivers, which drain into the sea from the Bandthad mountain range. The villages cluster along the mangrove-lined coastal wetlands, providing a fertile buffer zone for marine and terrestrial life. Besides offering a rich variety of foods, mangrove forests supply medicinal plants and materials such as thatch for housing and fishing gear. They are also refuges and nurseries for juvenile fish, crabs, shrimp, and mollusks.

Big changes came in the 1960s, when the Thai government embraced the Western model of export-led development. Industrial trawlers freely violated the no-fishing zone two miles from shore. They ravaged the sea bed and coral reefs, swallowing fish stocks faster than they could regenerate. As their coastal fishery waned, fishers spent more time on their boats and went further from shore. Some used explosives or poisons to harvest the remaining fish, or invested in better fishing equipment – causing stocks to plummet even faster.

Meanwhile, the government had granted mangrove concessions to the private sector to make charcoal briquettes. As mangroves dwindled, so did the diverse and useful products they provided. "Plants and animals, especially crabs, became scarce," explains Nom Ham Yak.

Their options narrowing, fishers began accepting menial jobs cutting mangroves for charcoal, working on commercial trawlers, or migrating into nearby cities for work. "Fishing incomes went down," Ham Yak says. "The people in the village had to leave for towns to find work in fish-canning factories, rubber-tapping plantations, general day labor, or construction. When the men went out to work and the wives stayed in the village, family relations would suffer. People also started selling pieces of land because there was no work at that time."

Worse, development agencies and banks had begun promoting shrimp farming in the mangrove forests. Unfortunately, the 'pink gold' of shrimp aquaculture can be a classic boom-bust venture in which the production from a shrimp pond declines drastically after the first five years. Local people discovered that initial quick returns were supplanted by mounting debts and environmental ruin as abandoned shrimp ponds spread across the landscape.

In 1999, a team led by economist Suthawan Sathirathai did a cost-benefit analysis of shrimp farming on a ▶

coastal village in Surathani Province, southern Thailand, to compare the monetary value of mangroves versus shrimp farms. When taking into account only marketable products, shrimp farms brought higher returns, with a net value of $9,335 US per acre compared to $1,665 for mangroves. But calculating in the indirect value of mangroves dramatically reversed these figures. When they assigned a monetary value to environmental services such as nurseries for fish and protection from erosion and storms, the value of the mangroves rose to $14,428, more than 50 percent higher than shrimp aquaculture.

## The positive tip

As university students, Pisit Charnsnoh and his wife, Ploenjai, were part of a generation of democracy activists. After graduating from Khon Khaen University, Charnsnoh got involved with rural development and urban labor rights. In 1985, the couple moved to Ploenjai's hometown in Trang Province, where they started a small organization called Yadfon Association (Yadfon means 'raindrop' in Thai), aimed at helping the coastal villages in the region. At that time, Trang Province residents were locked into a vicious cycle of increasing poverty, unraveling society, and a deteriorating ecosystem.

Yadfon members spent nearly a year in dialogue with the villagers of Ban Leam Makham, working hard to gain the community's trust. The approach was to support residents' own insights into their shared crisis. Charsnoh points out that this method was more powerful than giving the villagers lectures. "We couldn't go in as outsiders and tell them, 'This or that species is disappearing, you have to be careful,' or 'You have to protect these forests.'" Over time, and with some success with micro-credit, well-digging, and other rural development schemes, Yadfon began to earn the villagers' respect.

Through a series of meetings with Yadfon, villagers developed the idea of reviving the badly degraded mangrove forests around Ban Leam Markham and Ban Thung Dase. Because the land was under government control, Yadfon staff acted as a go-between to obtain consent from provincial authorities to create a community mangrove forest. The first of its kind in Thailand, the forest covered 95 acres of land. It later became part of a 235-acre area that combined the mangrove forest with a sea grass conservation zone.

An emerging inter-village network created a system to manage the forest. Allowing use of some areas of the forest helped to get buy-in from a community that would otherwise break rules if the whole forest were declared off-limits. They prohibited shrimp farms inside the forests, set up no-fishing areas, discouraged the use of cyanide and dyna-

mite, and banned push-nets altogether. They replanted some areas of the forest and designated others untouchable, to allow for natural regeneration. The network also began replanting the sea grass beds in the coastal waters of nearby Chao Mai village.

Their efforts paid off. There was an increase in the near-shore fish catch, and a species of fish thought to have disappeared returned. These early results boosted the villagers' commitment and motivated them to further action. An endangered dugong spotted in the waters near Chao Mai village helped win government support for their seagrass protections zones; the dugong became a living symbol for conservation progress in the area.

## Cycles and tipping points

Creating community mangrove forests was an Eco Tipping Point. It tipped the local community and environment from a vicious cycle to a *virtuous* cycle, and the momentum switched from destruction to recovery.

Vicious and virtuous cycles are 'feedback loops.' These mutually reinforcing cycles of cause and effect are the heart of Eco Tipping Points. In the negative tip, as mangroves were cleared, fisheries began to decline. As fish stocks fell, fishers worked harder to get them, causing stocks to fall ever faster. In this way, they were locked into a vicious cycle of declining resources and an accelerating race to get what little remained.

After the positive tip, the fishery began to restore itself. In a study of 500 families between 1991 and 1994, total catch rose by 40 percent. Fishers spent three to four fewer hours per week on the water, while their net incomes increased by 200 percent. They could return with full boats without using dynamite or pushnets. In this virtuous cycle, less pressure from fishers allowed fish stocks to recover faster, making the fishers' jobs even easier.

The revival of the fishery spawned other virtuous cycles. Better incomes meant there was less need to migrate from villages. Instead of being locked into depletion, villagers were now locked into conservation, as the financial incentive to preserve mangroves now outweighed the incentive to destroy them.

Most importantly, investing in their future motivated the people to fight for it. A sense of ownership gave them the grit and confidence to confront encroaching trawlers and to lobby the government to enforce the two-mile no-fishing zone. It also made them less likely to sell off their land, which often ended up being converted to resort development. Reviving the forests also helped to put zoning limits on shrimp ponds. Charnsnoh explains that while many of their villages have shrimp ponds, they have kept the ponds outside the boundaries of the forests.

While the community mangrove forests started small, the virtuous cycles rippled out over time. Today, these districts include 10 community forests and four sea grass and dugong conservation areas totaling 50 square miles. Meanwhile, Yadfon has extended its involvement to some 60 villages in the three districts. Through a growing network of grassroots organizations, Charnsoh is involved with influencing policy at the national and international levels, lobbying for stronger legal standing for the forests, and gathering support to stop the practice of intensive shrimp farming. Meanwhile, Ploenjai is connecting with villages further inland, discovering new links between inland and ▶

Gerald Marten

*Humboldt County, California decided to treat wastewater as a resource rather than a problem, and built the Arcata Marsh and Wildlife Sanctuary. The marsh relies on natural systems to filter the city's sewage.*

coastal regions. "I was working with the fisherfolk since the beginning," she explains, "and have moved up [the watershed]. Now we work with the whole ecosystem."

## Treating wastewater with wetlands

Across the Pacific Ocean, a small university town nestled in the northern California coastal redwoods may seem worlds away from a fishing village of southern Thailand. But Arcata's pioneering wetland and wildlife sanctuary reveals a similar underlying story: tipping a coastal ecosystem from a vicious cycle into a virtuous one.

Home to Humboldt State University, Arcata is a vibrant little community some 280 miles north of San Francisco. Historic charm is visible in the thriving downtown, and green space abounds with the community forest and wetland areas framing the vista of Humboldt Bay. Arcata's Eco Tipping Point arrived when the community faced a sewage treatment crisis. Until the early 1950s the city discharged unchlorinated primary effluent into Humboldt Bay. Secondary treatment and chlorination were not added until the early 1970s. In 1974, federal water quality standards were revised, and state and regional authorities began cracking down.

The community faced a thorny dilemma: Buy into a proposed $25-million regional sewage processing plant to discharge treated, up-to-standard wastewater into Humboldt Bay – or devise a more environmentally acceptable alternative. The former would be a costly undertaking for a community whose population at the time was just 12,600. Also, the sewer pipeline was a potential nightmare, since ruptures under the bay could make the pollution worse.

Most importantly, the regional plant would have unleashed a vicious cycle of runaway sprawl. By laying the pipeline along the undeveloped land between Arcata and its neighbors, Arcatans believed developers would soon follow with strip malls, big-box retail zones, and subdivisions. More development would have affected the thriving downtown and locked residents into car-dependency. The sewage plant itself, along with the roads and infrastructure needed to support the development, would have demanded an unprecedented outlay from municipal coffers and taxpayers' wallets.

## The problem is the solution

The idea to treat the wastewater as a resource rather than a problem first came from Humboldt State University fisheries professor George Allen. In 1969, he had begun testing whether Pacific salmon and cutthroat trout could be raised in ponds of seawater and partially treated wastewater. Bob Gearhart, another Humboldt State University professor, expanded on Allen's idea. Why not use a marsh to treat municipal sewage more easily, more sustainably, and more economically? "The whole issue is the ownership of the wastewater – what you have control over," explains Gearhart. "It's not about disposal – it's a resource issue."

After a protracted and divisive political and legal battle known locally as 'The Wastewater Wars,' regional authorities reluctantly allowed the city to create a small version as a pilot project. If it was successful, the community would be free to expand to a fully functioning system.

The chosen site was a derelict brownfield that included a sealed landfill, two defunct logging mills, and a log pond. Creating the marsh first meant breaking up concrete where the lumber had once been stacked and stored on the old lumberyard site. National Guard engineers blew it up and carted it off. Next, a bulldozer terra-formed the ground, creating a micro-terrain similar to that of a wetland. Volunteers from the community planted several kinds of native marsh plants in order to have alternating areas of open water and vegetation. They took care to plant more densely in the farther reaches of the marsh in order to fully remove any solids that remained in the water. In 1986, the treatment system was completed and became operational.

Today, the Arcata Marsh and Wildlife Sanctuary covers 154 acres of freshwater and saltwater marshes, tidal mudflats, and grasslands. Wastewater is piped from homes and buildings to the 'headworks,' where debris is removed and solids settle. The solids are sent to digesters for use as compost on the town's community forest. The sewage is sent to oxidation ponds before entering a series of treatment and enhancement marshes. Naturally occurring processes progressively purify the water, then two rounds of chlorination bring it up to state standards before its release into Humboldt Bay.

When Eco Tipping Points launch virtuous cycles, they employ nature's own processes to do most of the work. Instead of a multi-million dollar treatment plant, Arcata has used the "free" services of a wetland to purify its wastewater. Roots and stems of wetland plants form a dense, netlike filter that removes suspended solids. Plants and algae remove nutrients such as nitrogen and phosphorus, while bacteria and fungi decompose the solids and remove dissolved organic material. Bulrushes provide a canopy of shade, controlling the growth of algae, and helping to slow water flow so the microorganisms can do their job.

Plants and microorganisms pass organic material up the food web to small aquatic animals and insects, and ultimately to top predators such as hawks, foxes, and otters that have come to symbolize the wildness of Arcata's wetland. As plants, animals, and microorganisms break down organic material to extract energy, the residue passes out of the wetland ecosystem and into

the atmosphere as carbon dioxide and water. Meanwhile, larger animals, birds, and flying insects move out of the wetland, carrying organic material and nutrients and distributing them around the surrounding countryside. They also bring in seeds from other areas, promoting and supporting biodiversity. The end result is a wetland and wildlife sanctuary that supports 300 species of birds and mammals, 100 species of plants, and six species of fish.

As the wetland regenerated nature's systems, it spun off virtuous cycles for humans as well. Arcata's wastewater and derelict brownfield became economically and socially valuable. 'Recycling' gave Arcatans access to their formerly blocked-off waterfront. They gained a community space for leisure and recreation that draws as many as 150,000 visitors a year. Walking through a pathway surrounded by the songs of thrushes hidden in dense foliage, it is hard to imagine that the wetlands are actually working to break down household sewage. By creating a physical barrier to development, the wetland became a *de facto* 'zoning restriction' that was more effective than any government regulation. Students at Humboldt State University gained a research site. In the process, they provided a level of technical support, data collection, and monitoring that the town could not have afforded on its own.

More critically, choosing this unorthodox path set Arcata apart from its more conventional neighbors and fed the city's sense of pride. The marsh became a shared symbol that has helped to shape local identity. The community's motto today is "Flush With Pride."

"I think the marsh has become symbolic of [the idea] that we can do things our way," says Julie Fulkerson, a former Arcata mayor and councilor. "Thinking of this community without the marsh is very depressing. For one thing, if the massive [treatment] system had been built, it would have cost millions of dollars, and we'd be paying for it. And with a pipeline between Eureka and Arcata, I just can't imagine why there would not have been development in that entire strip. It would have looked like any other blended community in California."

## Common ground

In spite of their obvious differences, a deeper look at both Arcata and Trang Province reveals Eco Tipping Points at the source of each community's revival. Both communities had found leverage points in the vicious cycles where targeted actions could reverse them. Feedback loops that created and reinforced environmental degradation were replaced by feedback loops that rescued the ecosystems. By allowing mangroves to regenerate, and by designing a system that could treat waste with very little external manipulation, the communities let nature do the work of restoring their shared resources. The cohesion that emerged as a result gave them the impetus to rise to new challenges.

Despite their successes, these communities are not utopias. Both are on steep learning curves towards sustainability, and new challenges emerge as old ones are tackled. But they show how human and natural systems can tip together out of decline and towards greater health and sustainability. They show that local citizens can devise their own environmental solutions, without elaborate government regulations or high-cost technologies. Sharing the stories of these Eco Tipping Points can demonstrate that achievements often considered unrealistic, costly, or otherwise unfeasible are not just desirable alternatives. They are practical ones. ✹

**The city of Arcata, California was faced with a dilemma: Buy into an expensive regional sewage processing plant to bring their wastewater discharge into Humboldt Bay up to water quality standards, or come up with an acceptable alternative. They embarked on a pioneering journey, using wastewater to create and nourish a wetland where a logging pond and city dump had once been. The wetland provides prime wildlife habitat and recreation for the community at the same time it purifies the water.**

## Introduction

The people of Arcata, California, did not think of their sewage as a resource. In fact, like most of us, they did not think about their sewage much at all. But in 1974 they entered a period referred to as the "Wastewater Wars" when the need to reassess that view and assert their community's control of this "valuable" resource became essential.

Arcata is a small city located on Humboldt Bay, in the coastal redwood country of Northern California. In 1972 new federal legislation required that the water quality of the Bay be improved. Eureka, a larger city 5 miles south was often dumping raw sewage in to the bay, and Arcata's wastewater treatment plant was not adequately treating their wastewater. The State and regional government proposed a new

wastewater treatment plant that would serve this small university town and the other areas on the bay. This would be a very expensive undertaking for Arcata, population 12,600. Also, the sewer pipeline that would follow Highway 101 from McKinleyville on the north, through Arcata to Eureka and then out into the bay itself was a potential nightmare. Ruptures under the bay could make the pollution worse. And it would provide the infrastructure to open up the surrounding area to development.

Arcatans valued the unique character of their university town and their semi-rural setting. They had no desire to be engulfed by strip malls and housing developments. The regional wastewater treatment facility proposal was an engineer's and developer's dream. Turning that dream into their own is a story about taking charge of a local resource and tipping it from planned unsustainability to a sustainable, productive force in their community. The outcome was the Arcata Marsh and Wildlife Sanctuary (AMWF), 154 acres of freshwater and saltwater marshes, tidal mudflats and grasslands. It treats and disposes of the city's sewage while providing a wonderful natural recreational area, and has become an inspiration for other communities throughout the world.

In 1974, before this began, the area where the Arcata Marsh Interpretive Center (AMIC) now stands was surrounded by a derelict lumber mill with a log-filled marsh, cracking concrete and an unkempt landfill, affectionately known as Mt. Trashmore.

Arcata had recently fought a battle to prevent a new federal freeway from bisecting their town and developing the surrounding agricultural lands. Earlier on they had stopped the clear cutting of an adjoining redwood forest, turning it into a community park with hiking trails. It was the first community managed and owned forest in the country. Arcata also boasted the first recycling program in the country.

Despite their history of local environmental activism, taking on the State of California and the Feds was daunting. But there were things about Arcata that made it possible—though it didn't always seem that way in the midst of the fray. Arcata is the home of Humboldt State University, a campus known for its strong environmental programs. The more conservative surrounding areas see it as home to "kooks, tree huggers and flakes." Even within Arcata the town-gown split has traditionally mirrored this difference. However, a change in the federal electoral law had recently allowed 18 year olds to vote and the students and young residents used their new found voice to elect a new city council, one that campaigned on protecting the environment and near-by agricultural land. The university also contributed a faculty with incredible expertise and a willingness to share it.

Ironically, the shoreline of Humboldt Bay had not been accessible to the town for many years as it was blocked by the old saw mill, the landfill and the existing sewage treatment plant. Now it is the crown jewel of Arcata, used daily for recreation, birding and gazing by locals and tourists alike.

Committed and courageous leadership is essential to carry a campaign like this through to the end. The Arcata story had many. A trip around the marsh sanctuary introduces some of these leaders.

There is the George Allen Marsh on what was once an abandoned concrete log deck. In 1969 Dr. Allen, a professor of fisheries science at the university, had begun an experimental project intended to find out if Pacific Salmon and cutthroat trout could be raised in ponds with a mixture of partially treated wastewater and seawater. This project was the first to question the conventional paradigm of waste, accustoming Arcatan's to more elastic thinking about wastewater. In fact, the initial alternative proposal to the regional treatment plant was to use aquaculture based on some of Dr. Allen's ideas. Though this changed, he remained an important part of the development of the marsh.

Then we come to the Robert Gearheart Marsh, formerly minimally used pastureland. Dr. Gearheart was a professor of environmental engineering at the university. He always saw himself as a biologist first, and an engineer second. Like many of the important leaders in this project, he was willing to take a calculated risk —some would say a huge gamble. What they tried to do had never been done. He knew there was no guarantee his idea of a marsh would work. However, he was a careful scientist and an excellent communicator. His dedication to the vision of the marsh as way for the community to maintain control of its resources and uniqueness kept the torch alive. He feels that one of Arcata's strongest arguments was that "they were putting back into service 30-40 acres of unused wetland—basically ugly, industrial brownfields that nobody wanted."

Further on is Dan Hauser Marsh, the first marsh to be treated with wastewater. Dan served on the city council and as mayor from 1974—1982, and then spent 5 years as city manager. He felt the marsh grew out of political and land use issues rather than wastewater treatment. "When Bob Gearheart started explaining what a marsh could do and we began reading stories about what the marsh used to be like," Dan says, "I fell in love with the idea of marshes."

"The regional wastewater project was a good idea in theory, but it just didn't fit Arcata," according to Hauser. The proposed pipeline would increase pressure to develop the adjacent agricultural land. In fact, in 1974 one of Dan and the new city

council's first acts had been to deny water for development of a newly annexed area pushed through by the old guard. This effectively stopped the project.

Hauser and the council estimated that "The wastewater treatment plant and pipeline would have been the largest energy consumer in the county, costing a bundle to run." Even the environmental community was not wholly behind the marsh idea. David Joseph, an environmentalist, was the head of the North Coast Regional Water Quality Control Board (RWQCB), the body that was in charge of the proposed regional treatment plant. He was concerned that the city was trying "to get out of something." Also, at that time Eureka, the larger city down the road, was discharging raw sewage into the bay. He was afraid if the project didn't go through this wouldn't stop.

Continuing around the Marsh, Franklin Klopp Lake comes into view. Frank had been a city engineer since 1968, graduating to Director of Public Works. He was an "old guard" engineer and says he didn't object to the new treatment plant until he got to the last 4 pages of the report and saw the cost. It would mean doubling the sewer rates just to get it going. He had just pushed through a doubling of the rates and had taken quite a bruising. He was not anxious to repeat that. He started listening much more carefully to Bob Gearheart. But he needed to see an actual working example. Words were not enough. They went on a visit to Mountain View, a town on the peninsula south of San Francisco. There they saw "a simulated marsh made up in part of beer cans filled with foam and wood chips processing sewage." He figured with Arcata's resources it could work even better. He also gambled that the costs of developing the marsh for sewage treatment would be less than the regional plant. He figured it would have cost Arcata $10 million for their share of the construction of the regional system as opposed to the $5 million they spent. And the annual maintenance cost is about $500,000 instead of $1.5 million.

Today the marsh not only treats all of Arcata City's municipal sewage and wastewater, it also supports approximately 100 species of plants, 6 species of fish, and a multitude of bird and mammal species that have populated it naturally from the surrounding region, including otters. The marsh lies on the Pacific Flyway, which is the permanent or temporary home to over 200 species of birds. The Aleutian Goose, for example, takes off from the tip of the Aleutian Islands, flies across the Gulf of Alaska, and makes landfall in Humboldt County.

And most important, more than 200,000 people a year get to enjoy the marsh for recreation, birding, or scientific study, and the whole area now has access to the bay. The community support organization, Friends of Arcata Marsh, hosts regular birding tours. Moreover, since 1996 Arcata has hosted the annual 3-day Godwit Days festival, a birding event held at the peak of the spring migration, which

features field trips, boating excursions, lectures and other community activities for birders.

The vicissitudes of the political battle that led to the marsh are complex. It came down to the pro-marsh forces being able to prove that the marsh would "enhance" the water quality of the bay, meeting a key legal requirement. We will leave most of the politics aside for now and focus on the marsh itself.

---

## The Setting and Its History

Arcata city, population 16,651, lies on the north-east shore of Humboldt Bay, 280 miles north of San Francisco. It was established in 1850 as a supply port during the gold rush era that precipitated the timber boom which was to follow. Arcata rests in the heart of Northern California's "redwood county" and is home to Humboldt State University. In 1970, the population was 8,985, and it has risen to 12,850 in 1980 and to 15,197 in 1990. Today it has about 16,381. About half of Arcata's residents are students at Humboldt State University, and the overwhelming majority of the population (81.3 %) is Caucasian. It is a progressive town in an otherwise conservative region. The decline of the logging and fishing industries has caused the regional economy to flounder economically over the past three decades. Where Arcatans see an unspoiled landscape, small cottage industries and extensive community involvement as ongoing goals, others in the region would like to see industries that bring jobs, convenient shopping and affordable housing so they can stay there.

People have inhabited the region of Humboldt Bay for thousands of years. The indigenous Yurok and Wiyot people settled here because of its abundant resources and easy access to transportation. In those days, the Bay was surrounded by salt marshes, freshwater swampy meadows, and forest. Despite the Wiyot peoples' presence, the landscape remained relatively unchanged over centuries.

From 1849, however, European explorers arrived and began to settle in the area. The settlers forcibly displaced and sometimes massacred the indigenous communities, so that by 1860 the native population was down to less than 5% of its pre-Europe population. From 1870 the settlers began draining the marshes for agriculture, and built a wharf and California's first railroad track. The railroad linked dry land and a shipping channel built further out into the Bay that remained functional until the 1920s.

In 1945, two lumber mills operated in the area (one where the Interpretive Center is now located and the other where Allen Marsh is located). There was a log deck for

storing lumber. Butcher's Slough was elongated to make a channel for the mills, and a nine-acre log pond was built. The mills closed down in the late 1960's as the region's logging economy began to implode. The mills' condition further deteriorated over the years as a result of fires and neglect.

In 1964, the area that is now nicknamed "Mount Trashmore" was drained and diked in order to create a 40-acre landfill. Within a decade of the landfill starting operation, the ecosystem deteriorated as the overpopulation of cats and gulls began unraveling the food web, and leachate from the landfill contaminated the Bay. In 1973 the landfill was condemned, shut down, and sealed using mud from the Bay. This raised the question of what to do with the closed landfill,. Suggestions floated included a marina, motor cross area, golf course, baseball field and nature center/marsh restoration area. The City of Arcata finally decided to restore the area to a wetland. This coincided with the time that the federal and State government began strictly regulating wastewater.

---

## The History of Wastewater Treatment in Arcata

Arcata's former wastewater treatment plant was constructed in the 1940s, when the town's first sewers were installed. There was only primary treatment of the wastewater, with no chlorination, before it was discharged into the bay. It did not reduce Biological Oxygen Demand (BOD) or remove suspended solids and possible pathogens. Biological Oxygen Demand, a key standard for measuring treated wastewater, is the measure of oxygen required to break down organic materials in water. With untreated (or improperly treated) sewage high organic loads may reduce the amount of oxygen available to sustain fish or other aquatic life.

Fifty-five acres of oxidation ponds were added to the facility in 1958, which raised the level of treatment to secondary standards, followed by chlorination facilities in 1968. De-chlorination facilities were added in 1975. At this time, the State of California was getting tougher on municipalities' wastewater management policies in response to the Federal Water Pollution Control Act Amendments of 1972, the predecessor of the Clean Water Act.

In April of 1974, the California State Water Resources Control Board (SWRCB) adopted a Comprehensive Basin Plan for the North Coast Region. In a nutshell, the policy regarding discharges into the Bay was that it be "phased out at the earliest practicable date." However, the Regional Water Quality Control Board could grant exceptions if the discharging municipality could prove that "the wastewater in question would consistently be treated and discharged in such a manner that it would enhance the quality of receiving waters above that which would occur in the

absence of the discharge." This meant that a municipality would somehow have to prove that the wastewater, if discharged into the Bay, would enhance the water quality in the Bay. It was assumed that this would only be feasible if all the municipalities along the bay pooled resources to build a regional treatment plant. No single municipality was large enough to afford a treatment system advanced enough to satisfy these federal regulations.

In response to this plan, a “Joint Powers Agency” was created in 1973 to resolve the issue. The Agency consisted of the municipalities of Eureka, Arcata and McKinleyville in Humboldt County. An engineering firm, Metcalf & Eddy, developed a design for a regional facility that would serve these communities. The facility would be located on the Samoa Peninsula and was estimated to cost $25 million. In 1974, the Humboldt Bay Wastewater Authority (HBWA) was formed. It included the Joint Powers Agency and the McKinleyville and Humboldt Community Services Districts, and was charged with the responsibility of constructing the regional wastewater treatment plant.

The proposed plant would have large interceptors around the perimeter of the bay, with a major line crossing under the water in the region of active navigation. Effluent from the plant would be released offshore into an area of shifting sea bottom and heavy seas during winter storms. The facility would have been capital- and energy-intensive, and no one agency could afford it, so sharing expenses was believed to be the only solution to solving the Bay communities’ collective wastewater problems. However, as plans progressed, the logistical challenges of incorporating all communities as well as the costs--economic, social and ecological--became increasingly apparent. The plan became a hot political issue. A major concern, especially in Arcata, was that the creation of a sewer interceptor line running from McKinleyville to Eureka along Highway 101 would open up agricultural areas to suburban-style sprawl. The resulting strip malls and subdivisions would render the communities indistinct from one another and eliminate the rural character of the area. Another concern was that some of Arcata’s investments, both in the aquaculture project, and in the existing treatment plant, would be lost. For two years, the City Council tried to convince the Regional Water Quality Control Board (RWQCB) and HBWA that there had to be other alternatives to the regional treatment plant.

From the time the Comprehensive Plan was created, Arcata descended into a politically volatile period sometimes referred to as the "wastewater wars." The main factions split along two lines. The supporters were the development and financial interests, the engineering community consisting of the RWQCB as well as State officials, the bulk of Arcata’s "old-timers," and environmentalists who feared that if

Arcata opted out of the plan, HBWA would collapse and neighboring Eureka would continue to discharge its partially untreated effluent into the Bay. Supporters of the marsh were led by City Councillor Dan Hauser, Humboldt State University environmental engineering professor Bob Gearheart, then-Public Works director Frank Klopp, and Humboldt State University fisheries professor George Allen. Arcata citizens against the project tended to be environmentalists, professors and students, and newcomers who were fleeing other built-up areas further south, all of whom valued Arcata's natural beauty and historic rural charm.

In 1975, critics of the regional plan formed a coalition called "Citizens for a Sewer Referendum." They launched a campaign to call for a vote on the project. Their persistence paid off in eventually helping to stall the project. However, it became increasingly clear that if Arcata were to opt out of the plan it would effectively block the regional treatment plant. Other communities in HBWA could not afford to go forward without Arcata. Part of the antagonism towards the Arcata critics of the plan was that as time went on, inflation was rapidly increasing the cost of the project.

At this point, Arcata had to come up with an alternative plan that would not only assure treatment of the sewage, but that would satisfy the "enhancement" requirement in the Comprehensive Basin Plan. The idea to build its own wastewater treatment plant came about in 1976 amidst this divisive controversy. The City began exploring the design of a decentralized system which made use of constructed wetlands. The idea had its origins in the aquaculture work of Dr. George Allen. In 1969, Dr. Allen had begun an experimental project intended to find out if Pacific Salmon and cutthroat trout could be raised in ponds with a mixture of seawater and partially treated wastewater. This type of project challenged the conventional paradigm of waste in two ways. First, it said waste was a valuable resource rather than a harmful, expensive nuisance that had to be disposed of. It also declared that communities themselves—rather than centralized bureaucratic regulatory bodies—could manage this resource if given the freedom to do so. The idea of creating and using a marsh began to grow in the mind of Robert Gearheart, another Humboldt State University professor. Using the fish aquaculture project and a treatment marsh as probable ways to prove "enhancement," a city task force proposed that the natural processes of a wetland could be harnessed to effectively and efficiently treat municipal wastewater. This was a huge departure from business as usual.

In 1977, the City of Arcata team, consisting of George Allen, Bob Gearheart, Public Works director Frank Klopp and City Councillor Dan Hauser put their proposal to the Regional Water Quality Control Board. They would have a wastewater treatment process that used the existing primary sedimentation facilities, a 22.3 hectare oxidation pond facility, and three new constructed marshes. The effluent from the

marsh system would then flow through a 6.9 hectare lake before being discharged into the Bay. The city insisted that this system would not only protect all of the existing beneficial uses of the Bay, but would enrich them and even create new ones such as greater bird habitat and extensive recreational space. They presented this plan at RWQCB meetings and before the SWRCB, as well as to the citizens of Arcata itself. There was much quibbling over whether or not this was the type of enhancement outlined in the regulations. They challenged the Chair of the SWRCB to define exactly what was meant by enhancement. When he could not do it, the marsh supporters were able to prove that 'enhancement' of the Bay' was a meaningless term and legislation was introduced to eliminate this requirement.

Meanwhile, the Coastal Conservancy, a California non-profit organization became involved. The Coastal Conservancy purchases critical coastal habitat and conservation easements and works with communities to restore coastal land. They had been observing the events in Arcata and offered to help fund the wetlands restoration that was part of the three original marshes.

The University and the city formed the Task Force on Wastewater Treatment that created the pilot project Arcata was finally granted permission to undertake. The State Water Resources Control Board funded the 3-year study which began in September of 1979. It experimented with partially treated wastewater and the natural processes of wetland ecosystems. The results of the pilot project promisingly showed that not only could the constructed wetlands effectively treat wastewater, but that it would also enhance the biological productivity of the wetland environment into which wastewater was discharged. At the end of the pilot project in 1983, the Board agreed that the marsh system would indeed "enhance" the beneficial uses of the Bay for scenic enjoyment and educational study, and that a full-scale marsh system would satisfy the requirements of the Basin Plan. As the Task Force's original leaders emphasized, the plan was a simple, cost-effective application of an appropriate technology.

With the help of the Arcata City Council and political representatives in Sacramento, in 1983 the city received the go-ahead to develop the marsh.

---

## Constructing the Marsh

Sections of Arcata's old industrial sites by the shore of the bay had concrete where the lumber had been stacked and stored. To create the marshes, they had to break up the concrete. This was done as an activity with the National Guard combat engineers. They came in one Sunday, blew the concrete up, and carried it off. A lot of other residue from the saw mills also had to be taken out.

The section that is now Gearheart Marsh was originally pasture land. Because the terrain was slightly lower than the surrounding area, it had relatively large areas of open water once the water was let in. Marsh plants were allowed to grow in naturally.

When the landfill was closed, a dike was set up around the Bay. Sediment was scooped out and put on top of the landfill to seal it. The current wetlands surround the landfill, but none are on top of it. The landfill has been monitored for seepages of any kind and so far no contaminants have been found to have leached out of it.

The last marsh was "terraformed" to be various depths, deeper in some places, shallower in others. Moving the dirt around to create this "micro-terrain" was done by bulldozer. Differing depths was necessary because if it was kept shallow, the tubers of the sago pondweed would spread everywhere uniformly and undermine the biodiversity needed for the marsh to do its work. Flow in the marsh is faster at the edges of groups of aquatic plants than in the middle.

Vegetation was added to about one third of the last marsh, Hauser Marsh, to provide denser vegetation towards the end of the system. This ensures that the marsh will strip out any remaining solids in the effluent. They used native Hardstem bulrush brought in from a near by fishing lake. This marsh has alternating areas of open water and vegetation. Everyone said they wanted islands but they didn't work as well as planned and were removed. This was one important lesson they learned about creating a constructed wetland.

Sago pondweed seeds were broadcast into all the deep areas of all the marshes. Ducks love to eat this seed, providing a natural harvest to keep it from taking over. The team learned a lot about planting, often by trial and error. Some of the unsuccessful methods they used included burying the whole plant by the roots and throwing sprigs of the plants into the water. Unfortunately the waterfowl would eat everything immediately. Their greatest success came when they trucked in plants, cut off their tops, but kept a substrate of some of the original soil around the tuber. Previous orders of plants had come with their original dirt stripped away and they were unable to make the transition to the marsh. It takes about two years for the soil encrusted plants to grow to maturity.

A floating plant, Hydrocotyl, can sometimes take over and excessively shade the marsh, so it is periodically harvested. It is then mixed with sludge settled out from the first stage of treatment and used as compost in the Arcata Community Forest.

In 1986, the treatment system was completed and became operational. In the same year, the Coastal Conservancy provided funds to restore Butcher's Slough which

expanded the Sanctuary to its current size. The slough was refigured into a more natural channel, thereby enlarging the saltwater wetlands, and creating another freshwater marsh in a former log pond.

In order to extend the area of the marsh further, 3.15 acres of land on the inland side of the wetland area has been acquired, and a pond has been created there. Aquaculture still continues in parts of the marsh, though the fish are not raised for commercial purposes. However, more than half of the oysters grown in California are produced in a subsection of Humboldt Bay known as Arcata Bay.

---

## The Wastewater Treatment System

All municipal sewage treatment, whether conventional or alternative, is broken down into two main phases. Primary treatment is largely a mechanical process which separates the solids from the liquids, while secondary treatment removes contaminants and pathogens harmful to humans. The AMWS's primary treatment occurs in the headworks and clarifiers, while the secondary treatment occurs at the oxidation ponds, chlorination basins, treatment marshes and enhancement marshes.

The flow between components occurs through underground tunnels. Water levels in the marsh are not intentionally changed, for example, by adjusting weir levels. Once they are set, they are left to function on their own.

1. The Headworks. This is the first phase in the treatment of raw sewage. Water is piped underground from Arcata households to the headworks. Here inorganic materials are removed from the water using two Archimedes screw pumps that lift the raw sewage fifteen feet up and pass it through bar screens and grit separators before it enters the clarifiers.
2. Primary Clarification. The water sits for about four hours in the clarifiers. Two clarifiers (26 feet and 60 feet in diameter) are used for settling out any remaining suspended material that makes it past the headworks. The liquid effluent from the clarification process is sent to the oxidation ponds. The solids that settle out from the clarification process are sent to digesters.
3. Digesters. The remaining sludge from the clarifiers is pumped to the primary and secondary digesters respectively. Anaerobic microorganisms in the digesters consume the nutrients in the sludge as their food, and produce carbon dioxide, methane and hydrogen sulphide as by-products. The digesters mix the sludge by recirculating

methane gas with compressors. The remaining sludge goes onto a sludge drying bed. It is then mixed with yard waste and hydrocotyl, the aquatic plant, and is used to fertilize the soil in the Community Forest.

4. Oxidation Ponds. These ponds cover an area of 55 acres. They were built in the late 1950's. They are approximately five feet deep, and are used for settling out smaller solids not removed by primary treatment. The effluent is channeled by underground tunnel into the oxidation ponds to treat it to secondary standards. "Secondary standards" means that at least half of the BOD (biochemical oxygen demand) and suspended solids that remain after primary treatment have been removed. Breakdown of the floating and settling organic matter in the sewage is facilitated by algae growth and microbial/bacteria activities in the ponds. Sunlight is key to this process, because algae produce oxygen through the process of photosynthesis,. Algae also consume nitrogen and phosphorus, two common nutrients found in municipal wastewater. Microbes and bacteria use oxygen produced by the algae to break down and use the nutrients in the waste for their own metabolism. The by-product of this is carbon dioxide, which is then used by the algae to produce more oxygen for the microbes. Mechanical aerators are used in the oxidation ponds as well, to aid the algae in oxygen production.

5. Treatment Marshes. The treatment marshes reduce the remaining BOD concentrations, dead algae, and other suspended solids that remain in the oxidation pond effluent. There are three treatment marshes, each of which is two acres in area. They are located north of the oxidation ponds. They were created by subdividing the original oxidation ponds. All the marshes were planted with hardstem bulrush. This helps settle out the suspended solids by slowing down the water flow and preventing growth of new algae. The wastewater circulates through a marsh system before it is combined at a pump station and flows into the disinfection facility.

6. Disinfection. There are two separate stages of disinfection. The first occurs after the effluent passes through the treatment marshes. The second takes place after passing through the enhancement marshes just before its release into Humboldt Bay. Disinfection is necessary to kill any viruses or pathogens present in the water. Technically the second chlorination is unnecessary given the effectiveness of the enhancement marshes, but is required by regulators in order to conform to fecal coliform standards. Ironically, the standards are 'violated' only because birds are discharging excrement into the enhancement marshes. Because of the double chlorination, two

chlorine contact basins are necessary. The basins are located immediately south of the headworks. Any free chlorine remaining in the final effluent after the 60 minute contact time is removed with sulphur dioxide. After the second chlorination, depending on how much water is coming into the marsh, it is either released into the Bay or sent to the enhancement marshes. Usually it is mixed with water from the enhancement marshes and released into the Bay.

7. Enhancement Marshes. After the first chlorination process, the effluent flows into the enhancement marshes located northwest of the oxidation ponds. The three marshes, each named after George Allen, Bob Gearheart, and Dan Hauser respectively, cover a total of 31 acres. The flow is controlled through the use of sluice gates and weirs, though the water flow is rarely interfered with. The natural processes occurring in the marshes simultaneously purify the wastewater by removing excess nutrients and 'feed' the marsh plants with water high in nitrogen-rich organic matter. Nutrients are taken up by the plants and thus removed from the wastewater. The roots and stems of the plants also clean the water by forming a dense netlike filter that removes large quantities of suspended solids. Algae, fungi, bacteria and micro-organisms attached to the roots of these plants feed on these solids. This nutrient-rich habitat attracts many birds to the sanctuary. It has become an exceptional and cherished place for birders, recreation, research and education. Before discharge into Humboldt Bay, the water returns to the disinfection facility for a second chlorination. In total, all wastewater that enters the system spends about fifty days there from its first contact with the headworks to its release into Humboldt Bay.

---

## Marsh Specifications

- Design Population: 19,056
- Average Annual Flow: 2.3 million gallons/day (mgd)
- Maximum Monthly Flow: 5.9 mgd
- Peak Flow: 16.5 mgd
- BOD's Load: 4100 lbs/day
- TSS Load: 3400 lbs/day

---

## The Arcata Marsh Interpretive Center

All the work and ingenuity that went into the marsh was rewarded in 1987 when Arcata received the Innovations in Government Award from the Ford Foundation/Harvard University Kennedy School of Government and $100,000 to begin building the Arcata Marsh Interpretive Center. Open to the public since 1993, the Interpretive Center has exhibits on the political, ecological and technical aspects of the marsh. It is staffed by city employees on weekdays and by community volunteers on weekends and holidays. The Friends of the Arcata Marsh offers free educational tours of the AMWS and treatment facility.

---

## Spin-Offs

Creation of the marsh allowed not only reuse of wastewater but also ecological restoration of industrial, agricultural, and public service land:

- "Zoning." An important aspect of the case was that it not only prevented development in the agricultural areas between the communities, but it also restored a degraded waterfront area. Before the marsh, the land consisted of an abandoned lumbermill pond, channelized sloughs, low-quality pasture land, and a sealed landfill.
- A window to Humboldt Bay. Before the marsh was created, Arcata citizens had no access to its waterfront. After the AMWS, the entire area was opened up. As the disused landfill, "Mount Trashmore," was on higher ground, it now allows people a broad view of the Bay.
- Habitat creation. Some 60,000 acres of wetland are lost annually, mainly to draining and reclamation for development and agriculture. Of the remaining 100 million acres, many are severely degraded. Creating the Arcata wetlands not only provided a cost-effective, low-energy, low-maintenance essential service, it also locally reversed the trend of wetland loss.
- Green city. Arcata City Hall is environmentally active and maintains various other programs including a greenhouse gas reduction plan, solid waste reduction, Open Spaces initiative, pesticide reduction plan, pedestrian/bicycle plan, and community forest.

---

## The Community Forest

Arcata's Community Forest is comprised of approximately 622 acres of 120+ year old redwood forest obtained in several purchases financed by bond measures over a

50 year period. This acquisition process culminated in the dedication of the Community Forest in 1955.

The forestland was used as a source for the municipal water supply until 1964. Since then it has served many functions including recreation, education, sustainable timber harvesting, and wildlife habitat. It is also an outdoor laboratory for students and 'citizen scientists'. The forest serves as the headwaters of many of Arcata's urban streams. The main tree species is California Redwood but Douglas Fir, Grand Fir, Western Hemlock and Sitka are also present.

In 1979, a "Forest Management and Parkland Initiative" ballot measure was passed by Arcatans. Its intent was to create a long-term management program governed by 'ecological principles' that would preserve its recreational uses as well as generate revenue for further forest acquisition by carefully harvesting the forest's timber. This was the nation's first forest to be certified by the Forest Stewardship Council (FSC) as eligible for the "Smartwood" designation which denotes sustainably harvested wood.

Annual revenue generated by the forest is $500,000-700,000 per year. Trees are generally harvested every other year. Revenues from the sale of timber go into acquisition of land through outright purchase or by granting conservation "easements," where land owners are paid a fee to sustainably manage a given parcel of land. The focus is on areas contiguous to the forest or otherwise ecologically sensitive habitat. Land acquisition is contingent upon funding, mostly from grants.

---

## Conditions Contributing to Arcata's Success

1. Public Works Director Frank Klopp was an "old paradigm engineer" who subscribed to the belief that wastewater had to be disposed of and not utilized, typically through command-and-control and technology. He initially supported the regional wastewater treatment pipeline plan until he saw the cost to Arcata. He realized Arcata would never be able to afford it. This led him to seriously consider the merits of the 'other side's' plans. Through discussions with the marsh's main proponents and after witnessing a similar project in the San Francisco Bay area, he 'converted'. He then became a key figure in enlisting buy-in from engineers in the HBWA, SWRCB, and RWQCB as well as the more conservative members of the community in a way that someone outside his profession could not.
2. There was a reduction in the national voting age in 1971 from 21 years of age to 18. This new political clout among younger people had

particular impact in a university town like Arcata.

3. The change in political climate helped facilitate the "changing of the old political guard," which brought in a new generation of politically progressive leadership in City Hall.
4. The city displayed a high level of creativity in finding alternatives to the 'bust' that characterized the region's extraction-based fishing-forestry economy (possibly due to #2 and #3) (see Julie Fulkerson's and Dan Hauser's comments below).
5. The Marsh and the Community Forest became de facto 'zoning' initiatives because development could not occur there. This was more effective than any regulation, as the community forest and wetland became physical barriers to development, impregnable to the power or political machinations of the development crowd.
6. While initial concern over the pipeline was that it would allow development between Arcata and neighboring Eureka and McKinleyville, this bled into other concerns such as the mounting costs and potential liability issues if the pipelines under the Bay were to malfunction or rupture.
7. The presence of Humboldt State University meant access to cost-effective, often free, technical support, data collection, monitoring and research that continues to this day. This level of scientific and technical knowledge would not have been otherwise affordable to Arcata. Humboldt State is unique in that it has the only program known as "environmental resources engineering," which integrates fields which have normally been fragmented. It integrates biology, chemistry, physics and ecology. Partly as a result of Bob Gearheart's involvement with the marsh this program was redesigned so that engineering students, in their formative undergraduate years, get a more comprehensive outlook on the world (see Bob Gearheart's comments).

---

## Environmental Tipping Point Elements

1. Positive feedback. The trend in North America towards development that opens up formerly agricultural or virgin land was partially halted by the marsh in two ways: **i)** The Regional plan with its pipeline following Highway 101 would have provided the infrastructure for easy development of the agricultural land between McKinleyville and Eureka. Creating the marsh prevented the "freeing up" of this land. **ii)**

Creating the marsh efficiently reused disused land which had fallen onto the City because no one wanted it, rather than using new land which would have set in motion the feedback loops in i).

2. "Nature Doing the Work." Wetlands are well-known biological filters and perform critical cycling, filtering, purifying, water storage and flood prevention services for free. Using a wetland to treat waste simply takes advantage of natural biological processes occurring in wetlands. The main function of wetlands in wastewater treatment is the uptake or removal of nitrate, ammonium, phosphate, and possibly heavy metals.

---

### A Few of Many Examples of Nature "Doing the Work" in the Marsh:

· The structure of a wetland itself, with its slow flow and shallow depths allow sediments to settle as water passes through it. Also, the slow flow allows long contact times between the water and the surfaces in the wetland, allowing for crucial exchanges to happen at the microbial level.

· Two processes are of particular importance for nitrogen cycling:

1) Dentrification: The conversion of nitrates found in wastewater by bacteria into nitrogen gas through removal of oxygen in the anoxic conditions found in the detrital layers of the wetland.

2) Nitrification: The conversion of ammonium to nitrates (which must happen in oxygen rich regions of the soil, usually near the clumps of vegetation) which can then be converted into nitrogen gas through dentrification.

· Plants, primarily bulrushes, provide a "canopy" of shade over the water which inhibits algae growth, cools the water, slows down its flow, blocks UV rays, reduces the level of evaporation and helps to oxygenate the water through the process of photosynthesis. It also provides the habitat for microorganisms such as beneficial bacteria, on the roots of these plants. These bacteria are beneficial because they consume the suspended solid particles. Floating plants that block light are generally harvested by aquatic birds (although, as stated earlier, periodically they must be harvested if excessive). These floating plants also reduce the level of evaporation.

· The layer of litter on the soil surface of a wetland is known as the "detrital layer." It is in a generally constant state of slow decomposition by bacteria and other organisms. Generally wetlands have ample detritus because the anaerobic conditions in the wetland slow down decomposition. It offers surface area for decomposers such as fungi and bacteria that nitrify and dentrify (see above).

Acinomycetes is one particularly active microorganism that helps to cycle nutrients. Sediments in the oxygen-poor detrital layer also provide conditions for breaking down complex organics (i.e. greases, fats, solvents, fuels). As well, they sequester metals and provide a source of carbon, nitrogen and phosphorus to drive microbial processes.

· Sunlight, through the process of photosynthesis, produces oxygen needed to facilitate the processing of nutrients in the wastewater by microorganisms.

· Single and multi-celled organisms reduce the carbon and organic material and "pass it up the food chain" in the form of insects and birds which then fly away and carry it out of the wetland. Birds also bring in seeds from other areas which foster biodiversity and ensure continued growth of flora.

· Insect larvae and other insects such as beetles consume the solids which settle out of the partially treated wastewater.

3. "Success Breeding Success." The success and popularity of the marsh gave those in City Hall the freedom to imagine more possibilities for the marsh and other projects. It also has created a stronger base for support of environmentally friendly projects in the town.

4. Replication: Arcata's story has become a landmark in alternative wastewater treatment. It has attracted interest and visitors nationally and internationally. Bob Gearheart and other key players have traveled to various parts of the world to promote and provide technical support to other communities interested in adopting similar models. They have visited Oaxaca in Mexico, the West Bank, Egypt, Thailand, Indonesia, Palo Alto and Petaluma in California, and some smaller towns in the San Francisco Bay Area. Neighboring McKinleyville and Eureka are creating similar systems, though they are loathe to admit it has anything to do with influence from Arcata. Replication is not always easy to trace. Multiple sources may be consulted. Sometimes communities try and fail, others adopt some aspects of the Arcata model, and still others may not yet have done so, but the 'seeds' are lying dormant, needing only a final impetus to start bearing fruit.

# 1.0 INTRODUCTION

This report presents the results of a geotechnical exploration performed by LACO Associates (LACO) in connection with the City of Arcata's existing wastewater treatment facility improvements project (the project). The project location in relation to adjacent streets and landmarks is shown on the Vicinity Map, Figure 1. at 736 F Street, west of U.S. Highway 101 in Arcata, California (Site) as presented in Figure 1-Vicinity Map. This report is presented in two parts. Part 1 includes our findings, including subsurface data and improvements to potential geologic hazards and site specific seismic analysis results. Part 2 is primarily devoted to presenting interim design of foundation system.

## 1.1 Project Description

A list of improvement components, along with anticipated dimension, foundation elevations, loads, and occupancy categories is presented in Table 1. The location of these improvements are shown on Site Plan, Figure 2.

*Table 1. Improvement Component Locations*

| Improvement Component | Anticipated Plan Dimensions (feet) | Anticipated Foundation Depth (feet) | Anticipated Foundation Loads (ksf) | Occupancy Category |
|---|---|---|---|---|
| Headworks | 22 x 52 | 3.3 | 2.5 | 3 |
| Headworks | 17 x 15 | -1.9 | 2 | 3 |
| Oxidation ditch | 65 x 266 | 1.5 | 2 | 3 |

## 1.2 Scope of Services

LACO's scope of services is outlined in the task order issued by Carollo Engineers, Inc. dated April 12, 2018.

# 2.0 EXPLORATION

On April 24-26, and May 7-10, 2018, LACO explored subsurface conditions at the Site by (1) advancing 11 cone penetration test (CPT) probes to a maximum depth of 60 feet below ground surface (bgs), and (2) drilling 7 test borings to a maximum depth of 51.5 feet bgs. Approximate CPT and test boring locations are shown in Figure 2. Under the direction of a LACO geologist, CPT probes were advanced by Gregg Drilling, Martinez, California using a 15 square centimeter ($cm^2$) standard cone; test borings were drilled by Clear Heart Drilling, Inc. using a DR7K track-mounted drill rig equipped with a 4-inch diameter hollow stem auger, both. Our geologist logged the test borings in general accordance with the American Society for Testing and Materials (ASTM) Test Procedure D2488, and obtained relatively undisturbed and disturbed soil samples for visual classification and laboratory testing. Boring logs are presented in Appendix 1.

Select soil samples collected during our field exploration were subjected to the following laboratory tests:

- Particle Size Finer than No. 200 sieve (ASTM C117);
- Atterberg Limits (ASTM D4318);
- Consolidation (ASTM D2435);
- Direct Shear (ASTM D3080);
- Uncontinued Compressive Strength Test (ASTM D2166);
- Moisture Content (ASTM D2216) and Unit Weight (ASTM D2937); and,
- Basic Corrosivity (pH, resistivity, electrical conductivity, sulfate, chloride)

Laboratory test results are summarized in Table 2 and presented in Boring Logs (Appendix 1). Detailed test results are presented in Appendix 2.

DRAFT

# 3.0 SITE AND SUBSURFACE CONDITIONS

## 3.1 Site Conditions

The Site is located on the western side South G Street approximately 0.5 miles from its off-ramp from U.S. Highway 101. The planned building area is relatively flat, currently occupied by an existing wastewater treatment facility. The Site sits in the marsh of the north-eastern edge of the Arcata Bay at approximately 10 feet above sea level.

## 3.2 Geologic Setting

The Site is located in the Coast Ranges geomorphic province which is characteristic of northwest-trending ridges and valleys running subparallel to the San Andreas Fault Zone. Prior to development in the area the landscape was covered with delta marsh deposits that were saturated and tidally influenced. Published geologic maps (CDMG, 1984; McLaughlin et. al., 2000) indicate, the site is underlain by a layer of fill bay mud primarily consisting of alluvial fan and marine deposits that include clays, silts, and fine sands. Coarser deposits of sand and gravel are present in isolated areas as discontinuous lenses within the otherwise fine grain deposits. At unknown depth, the alluvial deposits unconformably overlie poorly cemented alluvial deposits of the early to middle-Pleistocene Falor Formation. Based on the morphology of the slopes in the vicinity, the contact between the unconsolidated bay margin sediments and underlying poorly unconformably overlies the Jurassic to Cretaceous age Franciscan Formation bedrock.

DRAFT

## 3.3 Subsurface Conditions

Our borings indicate the Site is blanketed by a layer of fill approximately 5 feet thick. The fill is underlain by marsh deposits approximately 40 to 60 feet thick. The marsh deposits are underlain by old terrace deposits. The fill consists of dense clayey sand with gravel. Marsh deposits consist of primarily soft fat/elastic silt, clay and fine sand. The terrace deposits consist of dense clayey sand that is comprised of fine to coarse sand with sub angular to rounded gravel. Geologic cross sections are provided in Figures 3. During drilling, free groundwater was encountered in our borings between 2 to 8 feet (bgs).

# 4.0 GEOLOGIC HAZARDS

## 4.1 Seismic Ground Shaking

Primary seismic hazards at the site include:

- Potential for ground rupture.
- Level of ground shaking anticipated to be experienced at the project site.

Regarding the former, the site is not located within an Alquist-Priolo earthquake fault zone (CDMG, 2000). Therefore, the potential for active surface fault rupture to adversely affect the project site is considered low.

The level of anticipated seismic ground shaking at the site is a function of the following factors:

- The closest distance from the seismic source (fault system) to the site.

- The magnitude of the postulated earthquake on the fault system.

A splay of the Fickle Hill fault is approximately 1.3 miles northeast of the Site (CDMG, 1983). The upper-bound earthquake considered likely to occur on the nearby Fickle Hill fault has an estimated moment magnitude (mw) of 6.9 (ICBO-CDMG, 1998). Peak ground accelerations of at least 0.635 g (63.5 percent of the force of gravity), and possibly more, may be expected to occur on this site as a result of this regional design basis earthquake (Petersen et al, 1999; CGS 2008;).

Recent and ongoing research into the seismicity of the Pacific Northwest has shown that the Cascadia subduction zone is capable of generating major earthquakes which will affect the site. The Cascadia subduction zone marks the boundary between the North American plate and the subduction Gorda and Juan De Fuca plates. It extends from offshore of Cape Mendocino, Humboldt County, to Victoria Island, British Columbia, and is considered capable of rupturing along its entire length and generating an upper-bound earthquake with a Mw of 9.0 (Satake et. al., 2003).

A site specific seismic response analysis, that provides response spectra and other seismic design parameters, is presented in Appendix 3.

## 4.2 Liquefaction

A state of soil liquefaction occurs when, as a result of cyclic fluctuations in pore fluid pressure, sediment grains lose contact with one another, causing a loss of effective stress and consequently of shear strength. Liquefaction is most commonly initiated by earthquake ground motions. A soil in a saturated, loose state and one which may generate significant pore water pressure when sheared, are the most likely to liquefy. Liquefaction is more likely to occur in sandy or non-plastic, silty soils, but may, in rare cases, occur in gravels and sensitive clays. Deposits most susceptible to liquefaction are young (Holocene-age, deposited within the last 10,000 years) sands and silts of similar grain size (poorly graded), in beds at least 1 meter thick, and saturated with water.

DRAFT

To evaluate the potential for induced liquefaction settlement to occur at the Site, we utilized the results of laboratory tests, Standard Penetration Test (SPT) data obtained in the field, input parameters presented in Table 3, and the computer program LiqSVs developed by GeoLogismiki.

*Table 3. Liquefaction Analysis Input Parameters*

| Calculation Method | Maximum Moment Magnitude | $PGA_M$ |
|---|---|---|
| NCEER 1998 | 7.3 | 0.81g |

In our analysis, we used the logs for test boring GBH-2, and GBH-5; a groundwater level during drilling of 6.5 and 4 feet bgs for GBH-5 and GBH-2, respectively; and assumed a groundwater level of 0 feet during a hypothetical seismic event. Fine-grained soils with a plasticity index of 7 or greater that have fine grained fractions exceeding 35 percent were input as not liquefiable because they tend to exhibit clay-like behavior (Boulanger and Idriss 2006). The results of our analyses are presented in Appendix 4 and settlement values are summarized in Table 4.

*Table 4. Liquefaction Induced Settlement Estimates Calculated from SPT Data and Laboratory Tests*

| Boring Number | Depth Range (feet bgs) | Potential for liquefaction induced settlement (inches) | Soil Description |
|---|---|---|---|
| GBH-5 | 0 - 5 | 0 | Clayey Sand |
| | 5 -10 | 4.97 | Clayey Sand |
| | 10 - 21 | 0 | Lean Clay* |
| | 21 - 30.5 | 6.61 | Clayey Sand |
| | 30.5 – 35.5 | 0 | Fat Clay with Sand* |
| | 35.5 – 45.5 | 0 | Fat Clay with Sand* |
| | 45.5 - 51.5 | 3.23 | Poorly Graded Sand with Clay |
| | **Total Settlement:** | **15 inches** | |
| GBH-2 | 0 - 5 | 1.68 | Sandy Lean Clay Fill |
| | 5 - 16 | 3.91 | Lean Clay with Sand |
| | 16 - 21.5 | 2.19 | Poorly Graded Sand with Clay |
| | 21.5 – 27.5 | 0 | Lean Clay with Sand* |
| | 27.5 - 35 | 0 | Lean Clay with Sand* |
| | 35 - 45 | 3.76 | Clayey Sand |
| | 45 – 52.5 | 3.43 | Clayey Sand |
| | 52.5 – 56.5 | 0 | Clayey Sand with Gravel |
| | **Total Settlement:** | **15 inches** | |

* Layers input as not liquefiable

As shown, results indicate the potential for liquefaction induced settlement generated from the LiqSVs program is approximately 15 inches in both GBH-2 and GBH-5.

To further evaluate the potential for liquefaction induced settlement we used CPT data and the computer software CLiq v.2.2.1.11 developed by GeoLogismiki. The results of our analyses are presented in Appendix 5, and settlement and lateral displacement values are summarized in Table 5.

*Table 5. Potential for Liquefaction Induced Settlement Calculated from CPT Data*

| Cone Penetration Test | Potential for liquefaction induced settlement (inches) | Lateral Displacement (Inches) |
|---|---|---|
| CPT-1 | 7.43 | 108.55 |
| CPT-2 | 4.50 | 84.91 |
| CPT-3 | 4.79 | 97.97 |
| CPT-6 | 4.35 | 92.89 |
| CPT-9 | 2.46 | 42.20 |

Although the LiqSVs software indicates that liquefaction would cause approximately 15 inches of settlement in GBH-2 and GBH-5, CPT data indicates that the potential for liquefaction induced settlement is 4.7 inches averaged across the Site. Lateral displacement ranged between 42 and 109 inches. Due to inherent variability, sensitivity to test procedure and uncertainty, SPT N-values may be affected by soil disturbance and heave within the boring which commonly occurs during drilling. Comparing the results of liquefaction induced settlements calculations from boring data (Table 4) and CPT data (Table 5) we note the following.

- Liquefaction assessment by use of the SPT data from test borings resulted in settlements of 15 inches; and
- Liquefaction assessment by use of the CPT data resulted in settlements of between 2.46 and 7.43 inches, or less than one half of the test boring results.

DRAFT

CPT based results tend to be more realistic for the following reasons, they provide an almost continuous penetration resistance profile for stratigraphic interpretation and the test's repeatability is very good (SCEC,1999).

## 4.3 Volcanism

According to the United States Geologic Survey (USGS) Volcano Hazards Program, the Site is not situated in a volcanically active area. The nearest volcano (Mt. Shasta) is located over 100 miles to the east. The likelihood of the Site experiencing active volcanism is low (USGS, 2017).

## 4.4 Slope Instability/Landsliding

Given the relatively flat site, we consider the potential for slope instability to adversely affect the Site to be negligible. Similarly, we consider the potential for liquefaction-induced lateral spreading to be low.

## 4.5 Flooding

According to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map, Map Number 06023C0852G, effective June 21, 2017, the Site is mapped as flood zone AE, which is inside of the special flood hazard area. A special flood hazard area is defined by the annual chance of a 100-year flood equaling or exceeding 1percent. Consequently, we conclude the likelihood of significant flooding occurring during the economic lifespan of the project is high (FEMA, 2017).

DRAFT

## 4.6 Tsunami Inundation

According to the CGS California Emergency Management Agency, Tsunami Inundation Map for Emergency Planning Arcata South Quadrangle, the potential for the Site to to experience flooding during a tsunami event is high.

## 4.7 High Groundwater

As noted in Section 3.3 of this report, groundwater was observed during our subsurface exploration between 2-8 feet bgs at the time drilling, with historically high groundwater levels judged to be approximately 1 foot bgs. Therefore, the risk of encountering groundwater in relatively shallow utility trenches or other required earthwork excavations for the project is considered high.

## 4.8 Soil Corrosivity

Corrosion is the deterioration of a metal through a chemical reaction with its environment. Factors that contribute to corrosion potential include the presence of soluble salts, soil and water resistivity, soil and water pH, and the presence of oxygen.

Corrosion potential of soils in the vicinity of the proposed school building was assessed by obtaining 12 soil samples across the site. The samples were analyzed for sulfate, chloride, and sulfide, resistivity, oxidation/reduction potential, and pH. The results of these tests are summarized in Table 6 with full lab results presented in Appendix 2

*Table 6. Corrosion Test Results*

| Sample | pH | Min. Resistivity (Ohm-cm) | Electrical Conductivity (µmhos/cm) | Sulfate (ppm) | Chloride (ppm) |
|---|---|---|---|---|---|
| GBH-1 at 3 feet | 7.16 | 643 | 1556 | 294 | 370 |
| GBH-2 at 10.5 feet | 7.92 | 163 | 6135 | 450 | 2,370 |
| GBH-2 at 51 feet | 8.27 | 614 | 1628 | 234 | 1,125 |
| GBH-3 at 4 feet | 6.44 | 225 | 444 | 750 | 870 |
| GBH-3 at 25 feet | 8.66 | 119 | 8403 | 1,725 | 2,550 |
| GBH-4 at 3 feet | 6.21 | 1,880 | 532 | 78 | 390 |
| GBH-4 at 4 feet | 6.07 | 1,285 | 778 | 450 | 330 |
| GBH-5 at 10 feet | 7.59 | 118 | 8446 | 825 | 7,650 |
| GBH-5 at 26 feet | 8.04 | 123 | 8130 | 525 | 6,600 |
| GBH-5 at 50.5 feet | 7.86 | 572 | 1748 | 138 | 840 |
| GBH-6 at 4 feet | 5.80 | 3,366 | 297 | 138 | 300 |
| GBH-7 at 10 feet | 6.48 | 558 | 1794 | 102 | 840 |

ppm – parts per million

For structural elements, CalTrans considers a site to be corrosive if one or more of the following conditions exist for the representative soil and/or water samples taken at the Site: chloride concentration is 500 ppm or greater, sulfate concentration is 2,000 ppm or greater, or the pH is 5.5 or less. A minimum resistivity value for soil and/or water less than 1,000 ohm-cm indicates the presence of high quantities of soluble salts and a higher propensity for corrosion (CDOT, 2012). As shown, the majority of the soil at the Site has a high propensity for corrosion. An engineer specializing in corrosion should be retained to evaluate whether or not a corrosion risk exists.

DRAFT

## 4.9 Soil Swelling or Shrinkage Potential

Expansive soils, generally consisting of cohesive, fine-grained clay soils, represent a significant structural hazard to buildings founded on them, especially where seasonal fluctuations in soil moisture occur at the foundation-bearing depth. Surface soils encountered during our field exploration consist of coarse and fine grained soils, with a low expansion potential. However, marsh deposits below the fill passes expansive soil characteristics.

# 1.0 INTRODUCTION

This report presents the results of the Engineering Geologic and Hydrogeologic investigation performed by LACO Associates (LACO) for the City of Arcata (Client). The purpose of the investigation was to evaluate effluent seepage from the oxidation ponds located at the Arcata Waste Water Treatment Plant (WWTP), hereafter referred to as the Site, with respect to the proposed development of Treatment Marsh Number 7. A Site Location and Boring Map is presented as Figure 1.

The Arcata WWTP uses several passive and natural processes to clean the City's effluent to water quality objectives (WQO) regulated by the NCWQCB. The existing oxidation ponds are under consideration for expansion by the potential lowering of pond bottom elevations and the possibility of increasing levee crest elevation. The proposed modifications are intended to increase the treatment capacity for long term functionality. This functionality is related to an increase capacity to meet future loads; to increase levee height to account for sea level rise; to assess potential impacts of the modifications, such as increased head, increased seepage, and slope instability.

# 2.0 SCOPE OF SERVICES

In accordance with LACO's Proposal dated December 16, 2016, data was collected at the WWTP to evaluate hydraulic and geotechnical properties of pond and levee soils from January 11, 2017 to January 19, 2017, under the direction of a LACO Certified Engineering Geologist. The collection of data consisted of the following:

- Review of operational records provided by the City of Arcata staff:
  - oxidation pond water levels;
  - flows in and out of various ponds;
  - personal observations;
- Review of historic photos and relevant reports;
- Conducting a field exploration that included:
  - water level monitoring in oxidation pond number 2 for 8 days;
  - site visit to directly observe bay side levee toe;
  - collection and testing of soil samples from the levee system;
- Conducting laboratory testing for selected soil samples to characterize soil properties; and
- Preparing this Engineering Geologic and Hydrogeologic Report as requested by the City of Arcata.

# 3.0 FIELD EXPLORATION AND LABORATORY TESTING

The subsurface investigation performed on January 12 to January 19, 2017, included hand auguring, soil sampling, and logging of four exploratory borings at the approximate locations shown on Figure 1 – Site Map and Boring Locations. The boring locations were selected because of access, location near proposed Treatment Marsh 7 and spatial representation. The four borings were advanced to discrete depths to collect levee soil samples using a Shelby Tube. One boring, B4, was collected east and below the levee material. Once the desired depth was reached, a 12-inch Shelby tube was attached to a push rod and

driven into the boring no more than 12 inches with a slide hammer, ensuring that the rod was plumb with the boring.

In order to separate the sample from the underlying soil, a duration of 10 – 15 minutes was allotted in order for the soil to expand within the Shelby tube, then the tube was slowly rotated to shear the material at the end of the tube and to alleviate water and/or suction pressures and improve recovery. To improve recovery of highly cohesive and compressible bay mud underlying the levee, sampling was conducted at the base of a test pit. The test pit was dug with a backhoe to a depth of 8 feet in the area of the boring. The Shelby tube was then pushed to approximately 9 feet at which point the sample was excavated using the backhoe bucket; extreme care was given to ensure that the backhoe bucket went well below the Shelby tube during excavation. Once samples were pulled, the Shelby tubes were kept upright and detached from the push rod. Afterwards, the sample was inspected to ensure the target soil was present and any voids on the top or bottom were filled with nonabsorbent material and capped to ensure moisture was not lost. A LACO geologist logged the borings and obtained relatively undisturbed samples for laboratory testing. Soils were logged and collected in general accordance with the American Society for Testing and Materials (ASTM) Test Procedure D2488 and D1587. Boring logs are presented in Appendix 1.

# 4.0 SITE CONDITIONS

Located at the north end of Humboldt Bay, the WWTP occupies 307 acres of the Arcata Marsh and Wildlife Sanctuary. The marsh and sanctuary includes freshwater marshes, saltwater marches, tidal sloughs, grassy uplands, mudflats, and brackish mash (Arcata Marsh & Wildlife Sanctuary, 2017). The facility contains a series of oxidation ponds, treatment wetlands, and enhancement marshes that are used to treat wastewater before discharging the effluent into Humboldt Bay.

## 4.1 Soils

Although the facility was developed on historic tidal flats consisting of 20 - 30 feet of bay mud deposits on the northern section of Humboldt Bay, there are historic channels, creeks, and sloughs which traverse the area, potentially associated with granular soils that have a significantly higher permeability than the bay mud deposits which may affect flux between the oxidation ponds and bay.

# 5.0 SEEPAGE INVESTIGATION

## 5.1 Document Review

The document review consisted of reviewing operational records provided by city staff. Records included original levee plans and personal observations. The review also included reviewing historic photos and relevant reports.

Prior to the construction of the WWTP in 1949, the area north Humboldt Bay was an undeveloped tidal flat which appears to have been crossed by a several potential channels including but not limited to the Jolly Giant Creek and portions of McDaniel Slough. These potential channels may represent areas of potentially high permeability sediments within the low permeability tidal muds. The potentially higher permeability

sediments were located using the original levee plans and historic aerial photographs from the Historic Atlas of Humboldt Bay and Eel River Delta between 1931 and 1969. Approximately five potential channels appear to have existed before the construction of the oxidation ponds and levees. These historic channels were mapped in GIS and labeled according to corresponding year as seen in Figure 2.

## 5.2 Permeability Sampling and Analysis

Relatively undisturbed samples collected during field exploration were submitted to a state certified laboratory. Laboratory testing was performed to estimate permeability of the levee soils.

Laboratory test results are included as Appendix 2 and are summarized in Table 1.

*Table 1: Laboratory Test Results*

| Boring | Sampling Method | Sampling Depth (bgs) | Side of Levee | Hydraulic Conductivity (cm/s) |
|---|---|---|---|---|
| B1 | Hand auger/Shelby tube | 4.7 – 5.7 | Pond side | 3.0E-07 |
| B2 | | 2.5 – 3.5 | Bay side | 2.0E-06 |
| B3 | | 3.25 – 4.25 | Pond side | 1.0E-06 |
| B4 | | 8.0 – 9.0 | Pond Side | 8.0E-08 |

## 5.3 Thermal and Visual Observations

The levee evaluation also included visual observation with the aid of Flir t420 thermal camera. The camera was used scan for flowing water near the levee toe during low tide. Several areas of flow were noted around the levee, from approximately Dr. Gearheart's office to approximately the old outwash, predominately near the southwest corner of Oxidation Pond Number 1 (Figure 2). Several thermal images (Appendix 3) record the observed flow and we estimated a maximum discharge rate of no more than 0.1 gallon per minute.

## 5.4 Water Level Monitoring

A pressure transducer (Hobo Logger) was installed to a depth of approximately 4 feet below the water surface in Oxidation Pond Number. The Hobo Logger collected pressure and temperature data every 15 minutes from January 11 to January 18, 2017. Upon retrieval of the pressure transducer, data was downloaded and pressure measurements were corrected for atmospheric noise; atmospheric pressure was subtracted from the pressure measurements thereby eliminating the low and high pressure weather system influence on the data. Both pressure and tide were graphed versus time to see if any correlation or tidal influence on the ponds exists. Each comparison consisted of a 24 hour period and for several days (Appendix 4).

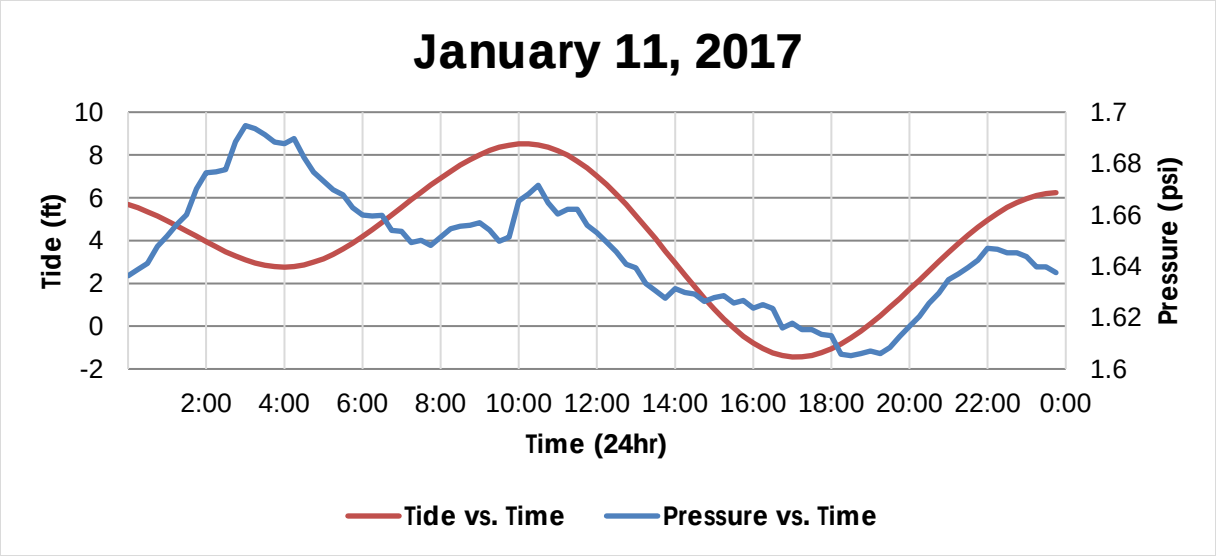

**Figure A: Daily tidal cycle and Oxidation Pond #2 pressure measurements**

The daily comparison of tide and pressure from January 11, 2017, to January 18, 2017, correlates, but further evaluation is needed to check the potential magnitude of flux between the oxidation ponds and bay. Figure A depicts the correlation between tide and pond pressure. However, given the flownet estimation and calculations with the measured hydraulic conductivity from B3, the theoretical likelihood is that seepage through the levee, using the highest hydraulic conductivity value from B3 is 267 gallons per day per hundred feet of levee. A complete daily tide and pressure versus time graphs are located in Appendix 3.

## 6.0 LEVEE SLOPE INSTABILITY ANALYSIS

The impact on levee stability of the proposed improvements was evaluated by constructing a series of quantitative slope instability analysis models. Existing levee geometry was taken from three representative cross-sections at stations 16+00, 31+00 and 39+00, chosen for their proximity to borings conducted as part of this and previous (LACO, 2009) exploration reports. The resulting geologic cross-sections were modified by the addition of 3 feet of fill to the crown and in-board pond slopes.

The pre-modification levee topography for the three sections was based on levee sections prepared as part of a civil design set, dated June 9, 2009, prepared, by LACO as part of the Arcata Levee Repair Project. Pond bathymetry and depth of sludge were incorporated from measurements made by Jeff Woodke, of Humboldt State University.

Soil engineering properties included in the model, such as density, cohesion, and friction angle were either measured directly by laboratory analysis (LACO, 2009), estimated based on a combination of Standard Penetration Test (SPT) data and grain-size analysis following procedures outlined in the 2013 Caltrans Geotechnical Manual (after Bowles 1977), or by engineering judgment and experience with local soils. The material divisions used broadly follow those used by the 2009 report with the addition of a unit representing unconsolidated bay mud. Material parameters used are presented in Table 2 below:

*Table 2. Instability Analysis Material Parameters*

| Material | Description | Unit Weight (lb/ft3) | Cohesion (psf) | Friction Angle (degrees) |
|---|---|---|---|---|
| 1 | Proposed Fill | 100 | 800 | 16 |
| 2 | Existing Revetment | 140 | 0 | 50 |
| 3 | Existing Granular Levee Fill | 132 | 0 | 35 |
| 4 | Existing Fine Grained Fill | 108 | 1000 | 25 |
| 5 | Unconsolidated Bay Mud | 100 | 400 | 0 |
| 6 | Partially Consolidated Bay Mud | 100 | 800 | 16 |

To provide an assessment of the full range of conditions that may occur during the design life of the levee, seismic slope stability analyses were run. The impacts of a design level earthquake on slope stability were estimated using the pseudo-static approach, where the earthquake load is simulated by "equivalent" static horizontal acceleration acting on the mass of the landslide. The pseudo-static seismic loading coefficient was calculated in accordance with guidelines presented in California Geologic Survey Special Publication 117A, and Note 48 using a 6.9 magnitude earthquake on the Fickle Hill Fault Zone.

The analyses were performed using the computer program Slide 7.0. The analyses utilized the Modified Bishop method to search for the critical failure surface and calculate the factor of safety against sliding. The critical failure surface is defined as the surface with the lowest calculated factor of safety. In general, factors of safety greater than 1.0 indicate stable conditions, while factors of safety less than 1.0 indicated an unstable condition.

The following worst case scenarios were considered in the slope instability models:

- A design level earthquake, at low tide with the ponds filled to 1 foot below the levee crown; and
- A design level earthquake, with the ponds empty, and high tide 1 foot below the levee crown.

The results of our analysis are presented in Appendix 5 The slope stability analysis for each of the sections, run for the high tide, empty pond scenario, generated critical failure surfaces (the surface with the lowest factor of safety) extending through the bay mud under the levee prism to a toe surfacing within the pond. The resulting failure surfaces had pseudo-static factors of safety ranging from 1.33 to 1.49. The slope stability analysis for each of the sections run for the low tide, full pond scenario, generated critical failure surfaces, initiating on the levee slope within the pond and surfacing in the tidal flat approximately 30 to 50 feet from the levee toe. The resulting failure surfaces had had pseudo-static factors of safety ranging from 1.45 to 1.71. Based on CGS Special Publication 117A guild-lines Pseudo-Static analysis with a factor of safety of greater than 1 is considered stable.

# 7.0 CONCLUSIONS AND RECOMMEDATIONS

- Construction of additional treatment facilities inside the levee system will not result in a measureable discharge of untreated effluent to the bay through or under the levee system. A project specific geotechnical report is recommended to develop earthwork recommendations.

- Construction of improvements to increase the height of the levee crest using bay mud deposits is feasible. A project specific geotechnical report is recommended to develop earthwork recommendations.

- Average theoretical seepage from the oxidation ponds to the bay through the levee materials is insignificant (0.01 gpm for the entire levee system) and the rate of movement (<1 foot/year) is such that any seepage would likely result in attenuation of wastewater constituents to below regulated levels.

- There is a potential for preferential seepage from the oxidation ponds to the bay through higher permeability sediments within and below the levee system. While flow on the order of 0.1 gallons per minute was observed at the levee toe during low tide at several locations, the source of flow was not confirmed. Several sources for the flow exist which are not mutually exclusive: 1) discharge of infiltrated rainwater; 2) discharge of bay water trapped behind the geotextile located under the rip-rap; 3) effluent seepage through the levee; and 4) effluent seepage under the levee. Chemical testing of the flow is recommended to aid in its characterization.

*STATEMENT OF CONFIDENTIALITY*

***This document is not for public distribution.*** ***This report identifies the locations of cultural resource sites. Disclosure of this information to the public may be in violation of both federal and state laws. Applicable United States laws include, but may not be limited to, Section 304 of the National Historic Preservation Act (NHPA) (16 U.S.C. 470w-3), the Archaeological Resources Protection Act (ARPA) [16 U.S.C. Section 9(a) and Section 470(hh)], and Executive Order 13007. In California, such laws include, but may not be limited to, Government Code Section 6254.10. Site location information is confidential and is not for public disclosure.***

***Additionally, records maintained or in the possession of the Native American Heritage Commission or state and local agencies that are exempt from public disclosure include those that contain information on Native American graves, cemeteries, and sacred places, and include records obtained during consultation with Native Americans (California Government Code §6254(r) and §6254.10).***

*LIMITATIONS STATEMENT*

***This report has been prepared based on certain key assumptions made by DZC Archaeology & Cultural Resource Consulting, LLC (DZC) that substantially affect the conclusions and recommendations of this report. These assumptions, although thought to be reasonable and appropriate, may not prove to be true in the future. The conclusions and recommendations of DZC are conditioned upon these assumptions.***

***These assumptions include confidential information provided by the Native American Heritage commission on September 10, 2019, by the Northwest Information Center on July 19, 2019, and by direct observation of site conditions and other information that is generally applicable as of October 9, 2019. The conclusions and recommendations herein are therefore applicable only to that timeframe. Information obtained from these sources in this timeframe is assumed to be correct and complete. DZC will not assume any liability for findings or lack of findings based upon misrepresentation of information presented to the project team or for items not visible, made available, accessible, or present at the site at the time of the Project site survey.***

# MANAGEMENT SUMMARY

This report details the results of a Phase I Cultural Resources Inventory conducted by DZC Archaeology & Cultural Resource Consulting, LLC (DZC) on portions of Humboldt County Accessor's Parcel Numbers (APN) 503-241-010, 503-232-013, 503-251-012, 503-211-026, 503-241-016, 503-251-009, 503-241-011, 503-241-013, 503-211-005, 503-241-012, and one unnumbered parcel. The parcels combined represent the City of Arcata Wastewater Treatment Facility (AWTF) and City Corporate Yard. The City of Arcata retained DZC to conduct the inventory in support of a National Pollutant Discharge Elimination System (NPDES) permit through the North Coast Regional Water Quality Control Board (NCRWQCB).

Approximately 123 acres comprise the Area of Potential Effects (APE), located in the City of Arcata, Humboldt County, California. The legal location of the APE is Township 6 North, Range 1 West, Section 32, and Township 5 North, Range 1 East Unsectioned, of the Arcata South 7.5-Minute USGS Quadrangle (Humboldt Baseline Meridian). The Environmental Study Limits (ESL) constitute a 0.5 mile radius around the APE.

The City of Arcata is the Lead Agency providing regulatory oversight for the permitting process. The purpose of this cultural resources inventory is to satisfy the requirements of the National Environmental Policy Act (NEPA) of 1969, Section 106 of the National Historic Preservation Act (NHPA) of 1966, and the California Environmental Quality Act (CEQA) of 1970 (all as amended), and the City of Arcata Historical Preservation Element.

In advance of a field survey of the APE, DZC completed historical research for the APE and ESL at the Northwest Information Center of the California Historic Resources Information System (NWIC). The review identified 16 previously conducted archaeological surveys of interest: 10 surveys within the APE, and six outside the APE but either partially or completely within the ESL. Five previously recorded resources were identified within the ESL and one within the APE. The geoarchaeological research indicated a low potential for buried and surface prehistoric resources, and a moderate potential for buried and surficial historical resources within the APE.

A field survey of the APE was undertaken on October 9th, 2019, and November 5th, 2019, by Dimitra Zalarvis-Chase, M.A., RPA a U.S. Secretary of the Interior qualified archaeologist and staff archaeologist Kelly Hollreiser (B.A.). Of the 123 acres, 75 acres were intensively surveyed in transects of 15 meters or less. Approximately 48 acres within the APE are unsurveyable ponds, wetlands, and marshes. Impediments to ground visibility included dense vegetation, imported gravels, and paved areas. The surface scrapes were utilized where visibility was poor.

One built environment complex, the AWTF, and a mapped alignment of a California Historical Landmark (CHL) No.842 (The Arcata and Mad River Railroad/Union Wharf and Plank Walk Company) are present within the APE. The AWTF was determined ineligible for the National Register of Historic Places in 2006. Portions of CHL No.842 within the APE are limited to a historically mapped alignment; the remaining physical elements are located outside of and immediately adjacent to the APE.

This report recommends a Finding of No Impacts to historical, archaeological, or tribal cultural resources, as defined by CEQA, and a Finding of No Effects, as defined by NEPA. It is best practice to avoid cultural resources whenever possible. Additional survey will be required if the project changes to include areas not previously surveyed.

# 1.0 INTRODUCTION

## 1.1 PROJECT DESCRIPTION

The City of Arcata Wastewater Treatment Facilities (AWTF) Improvements Project aims to improve local water management facilities by addressing National Pollutant Discharge Elimination System (NPDES) requirements for wastewater treatment in Arcata, California (City of Arcata 2019). The goals of the project are to address sea level rise and long-term community requirements through improvements to current and future infrastructure at the AWTF. The project will be completed in two phases and will include improvements to oxidation ponds, treatment wetlands, and other infrastructure at their northern Humboldt Bay location (Appendix A, Figures A1-A4).

The city of Arcata retained DZC Archaeology & Cultural Resource Consulting, LLC (DZC) to conduct a cultural resource investigation of the AWTF Improvements Project to support compliance of State and Federal regulations regarding cultural resources, Native American resources, and historic properties. DZC is an environmental consulting firm with over 10 years of experience with projects throughout northern California. DZC conducts cultural resource studies in accordance with the Secretary of the Interior's standards and in compliance with all applicable federal, state, and local codes, acts, regulations, and orders relating to cultural resources, where applicable. This cultural resources inventory report was prepared by Dimitra Zalarvis-Chase, a Registered Professional Archaeologist, who meets the Department of the Interior's Professional Qualifications Standards in Prehistoric and Historic Archaeology, with contributions by Sydney Kerkhove-Peltier, B.A., Jaques Kerkhove-Peltier, M.A., and Kelly Hollreiser, B.A.

## 1.2 PROJECT LOCATION

The 123-acre (ac) project area is situated in Humboldt County, California, along the northern shoreline of Humboldt Bay and south of Humboldt State University (Figure 1). The legal location of the project area is Township 6 North, Range 1 East, Section 32; Township 5 North, Range 1 East, Unsectioned; Humboldt Base Meridian, of the United States Geological Survey (USGS) Arcata South 7.5-Minute Series (1959) Quadrangle (Figure 2).

## 1.3 DELINEATION OF THE APE & ESL

The physical location with the potential for impact to archaeological resources is designated as the Area of Potential Effects (APE). The Environmental Study Limits (ESL) for the project area constitutes an additional 0.5-mi background review radius around the APE.

An APE varies depending on the potential impacts of the project, the type of environmental clearance required, and the Lead Agency. The 123 ac area constitutes the APE for this project. The proposed project must meet National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA) standards, as the project requires a permit from the North Coast Regional Water Quality Control Board (NCRWQCB), funded by the Clean Water State Revolving Fund (CWSRF), a federal financing program discussed further in Section 2.1.1 of this report.

Horizontal boundaries for the APE were provided to DZC by the City of Arcata. The APE is composed of four separate study units, including four staging areas (Figure 2, Table 1). Unit 1 (Staging Area 1) measures 388 ft (north-south) by 300 ft (east-west); Unit 2 (Staging Area 2) measures 466 ft (north-south) by 139 ft

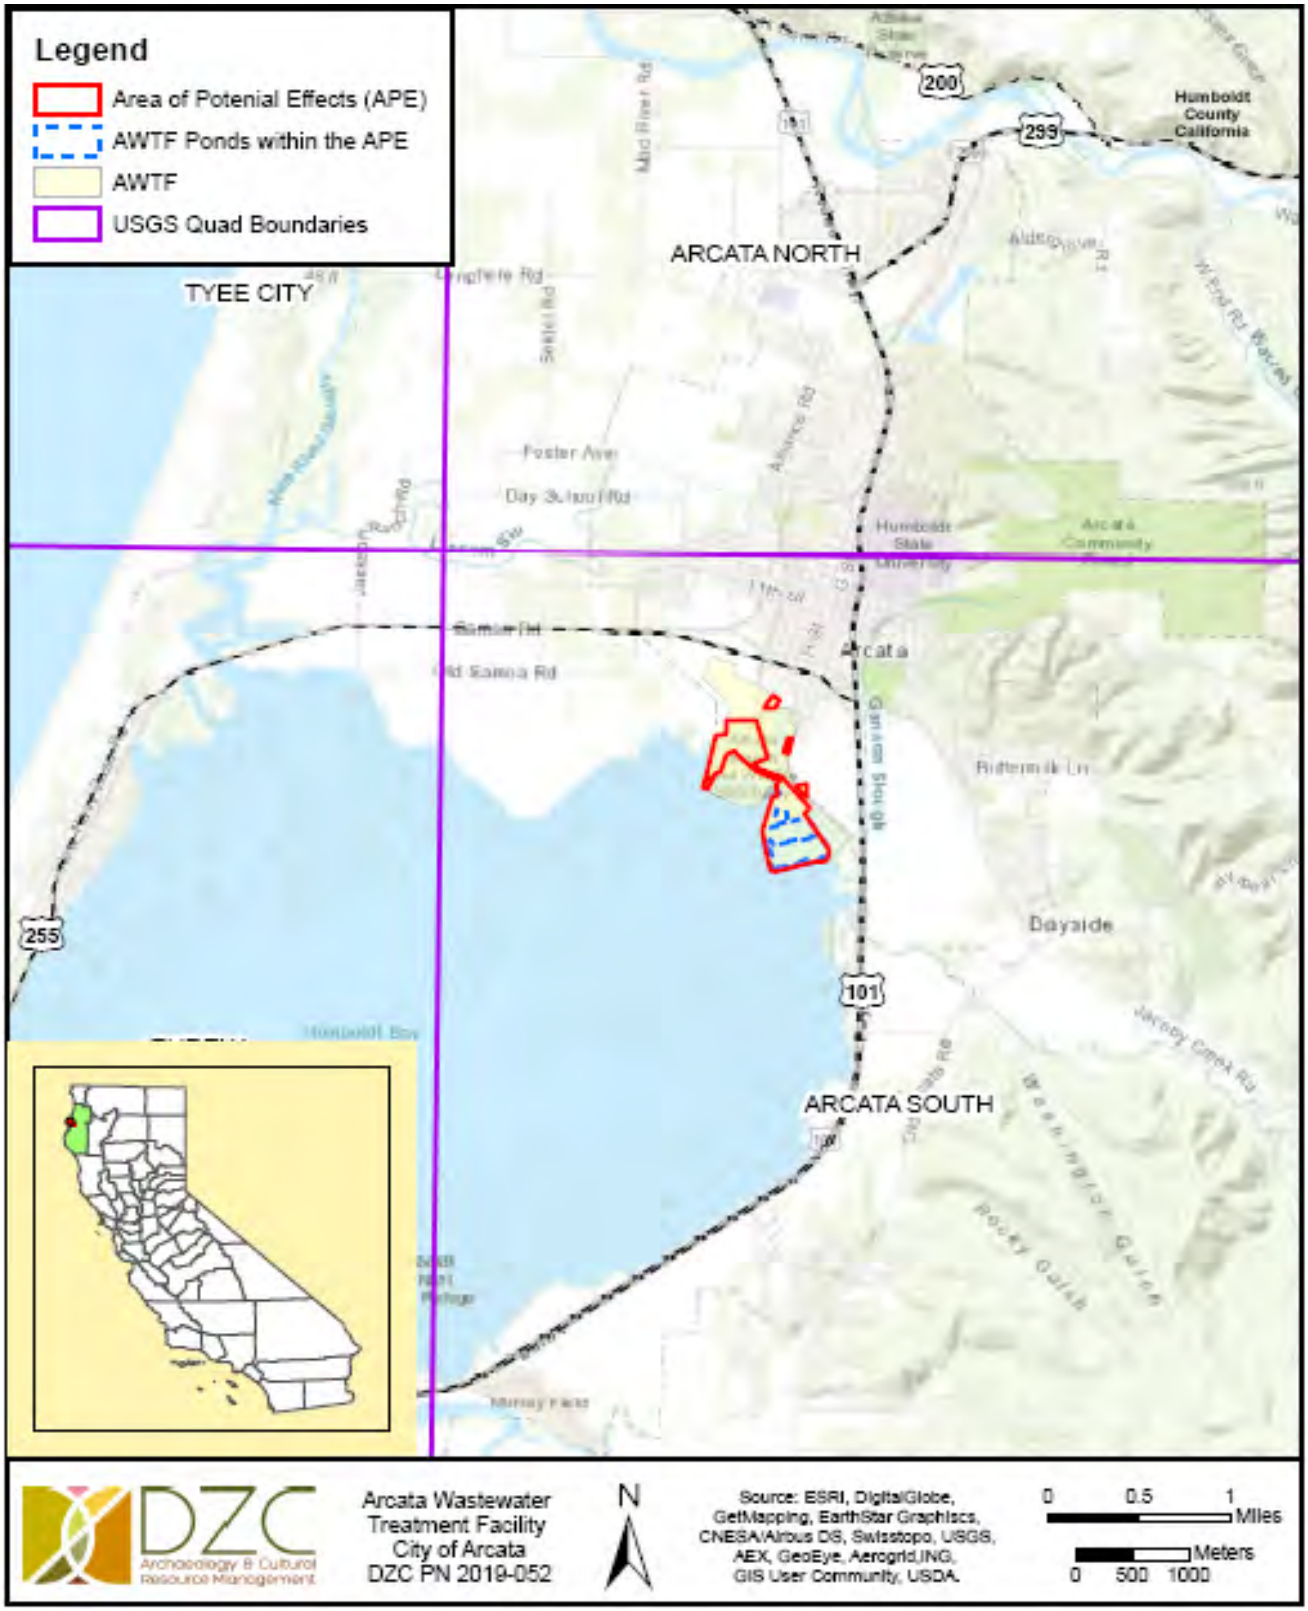

**Figure 1 Project Vicinity**

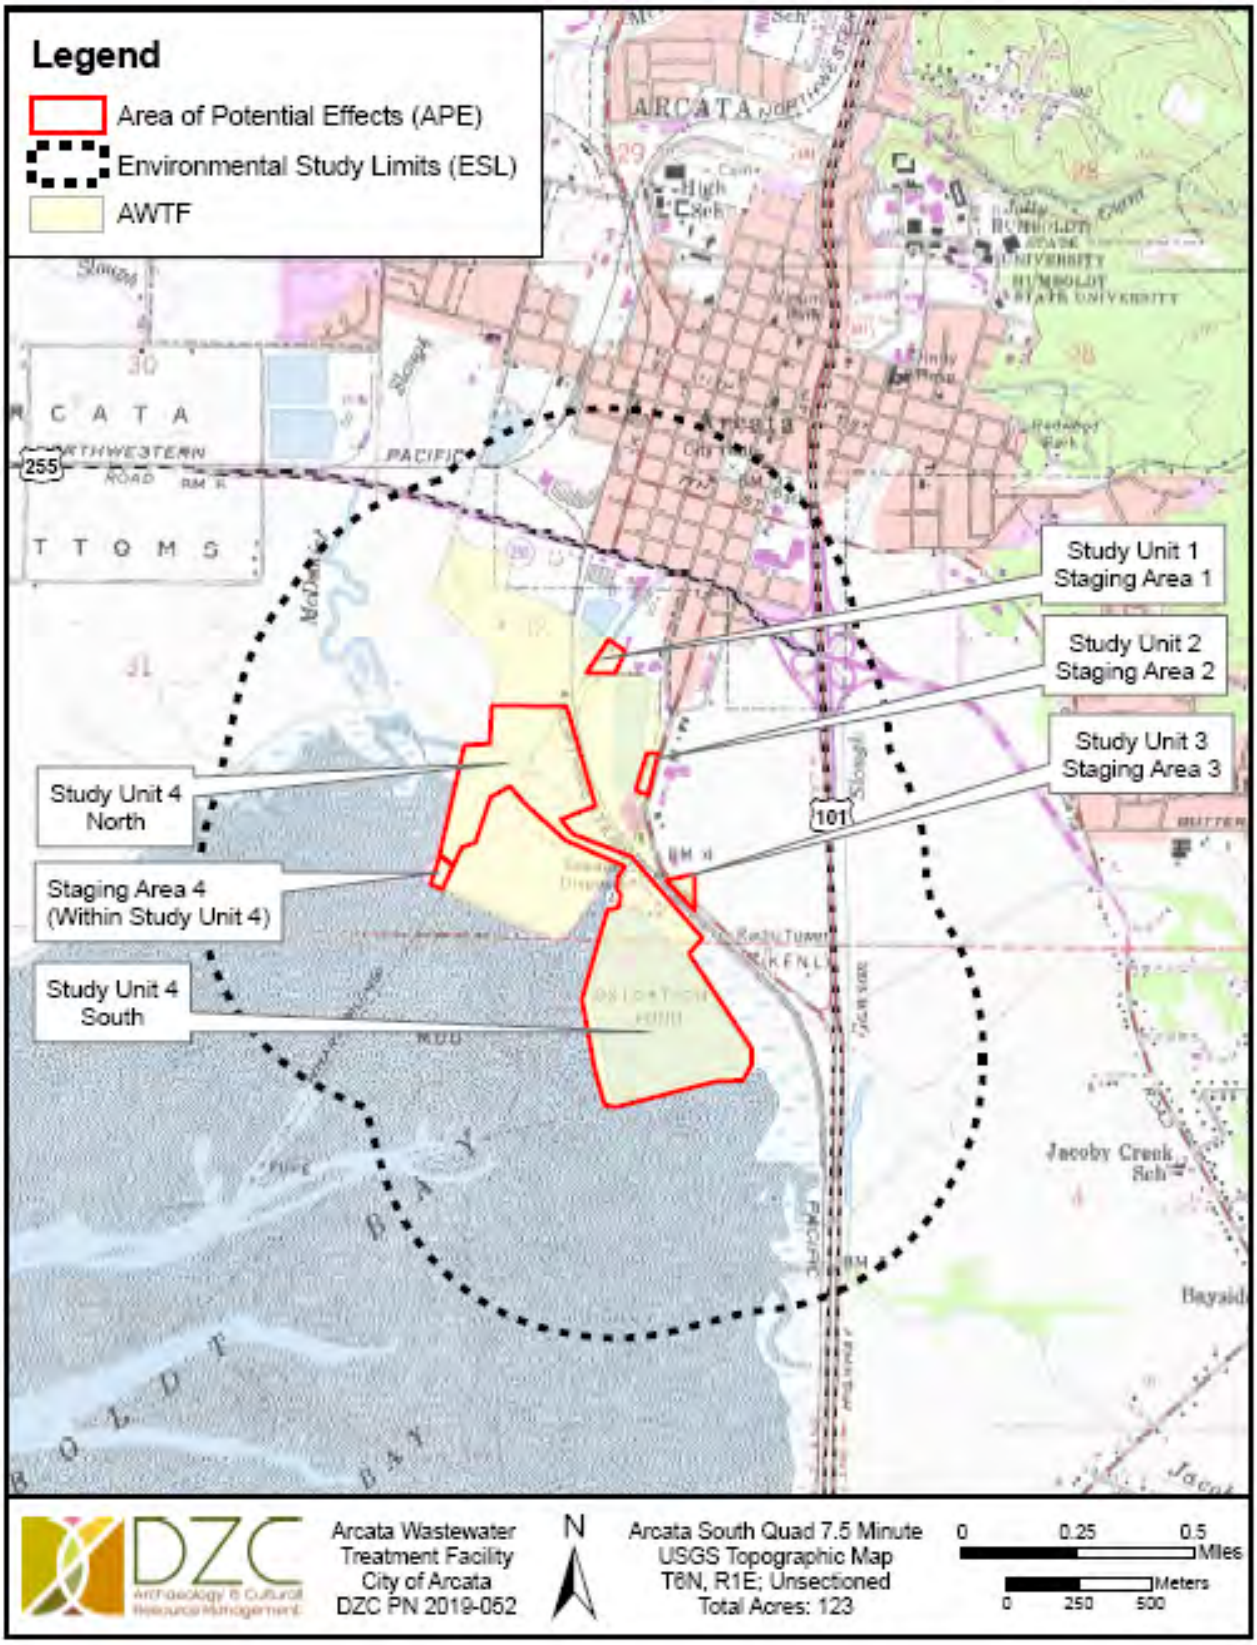

**Figure 2 Project Location**

(east-west); Unit 3 (Staging Area 3) measures 288 ft (north-south) by 302 ft (east west); and Unit 4 (Staging Area 4) measures 257 ft (north-south) by 168 ft (east-west). Staging Area 4 is completely encompassed in the northern section of the largest APE polygon. Unit 5 is the largest area, consisting of northern and southern sections. It also encompasses Staging Area 4. The horizontal boundaries of the northern section of APE Unit 5 measure approximately 2,173 ft (north-south) by 1,495 ft (east-west). The horizontal boundaries of the southern section measure approximately 2,520 ft (north-south) by 1,827-ft (east west).

**Table 1. Project location descriptions.**

| APE Study Unit | Legal Location | AWTF Association | Acreage |
|---|---|---|---|
| **1** | Arcata South Quad T6N, R1E, Section 32 | Staging Area 1 | 2.1 acres |
| **2** | Arcata South Quad T6N, R1E, Section 32 | Staging Area 2 | 1.5 acres |
| **3** | Arcata South Quad T6N, R1E, Section 32 | Staging Area 3 | 1.5 acres |
| **4** | Arcata South Quad T6N, R1E, Section 32 | Staging Area 4 | 1.1 acres |
| **4** | Arcata South Quad T6N, R1E, Section 32; T5N, R1E, Unsectioned | Arcata Marsh; Treatment Ponds; City Yard | 117 acres |

DZC did not have access to the structural engineering designs for the AWTF project, and therefore the vertical APE for this study is based limited information concerning the types and diameters of pipes that are proposed to be installed (Appendix A, Figures A-3 through A-6). The largest of these is 30 inches (in.) in diameter, and therefore the expected vertical excavation depth would be approximately 3-5 ft below the ground surface. The vertical APE is expected to range from -5 ft below to approximately +10 ft above the ground surface.

It is highly desirable to conduct all surveys prior to ground disturbance. However, ground disturbance in the form of grading, facilities and levee construction, and pond, marsh, and wetland excavations all occurred on site prior to the archaeological survey.

# 2.0 Regulatory Setting

## 2.1 State

The following sections discuss the regulatory guidelines for this Cultural Assessment Report.

### 2.1.1 California Environmental Quality Act (CEQA)

The lead agency for this project is the City of Arcata. CEQA requires a lead agency to determine whether a project may have a significant effect on historical resources (Section 21084.1). If it can be demonstrated that a project will cause damage to resources Eligible for or Listed in the California Register of Historical Resources (CRHR), Tribal Cultural Resources (TCRs), and other resources on county or local lists, or those determined by the lead agency to be significant, the lead agency may require reasonable efforts be made to permit any or all of the resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (Section 21083.2[a], [b], and [c]).

A historical resource is a resource listed, or determined to be eligible for listing, in the CRHR (Section 21084.1); in a local register of historical resources (Section 15064.5[a][2]); or any object, building, structure, site, area, place, record, or manuscript that a lead agency determines to be historically significant (Section 15064.5[a][3]).

Public Resource Code (PRC) Section 5024.1, Section 15064.5 of the CEQA Guidelines, and PRC Sections 21083.2 and 21084.1 were used as the basic guidelines for this cultural resources study. PRC Section 5024.1 requires an evaluation of historical resources to determine their eligibility for listing in the CRHR. The purpose of the register is to maintain listings of the state's historical resources and to indicate which properties are to be protected from substantial adverse change. The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the National Register of Historic Places (NRHP), enumerated below.

According to PRC Section 5024.1(c) (1–4), a resource is considered historically significant if it (i) retains "substantial integrity," and (ii) meets at least one of the following criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
2. Is associated with the lives of persons important in our past;
3. Embodies the distinctive characteristics of a type, period, region or method of installation, or represents the work of an important creative individual, or possesses high artistic values; or
4. Has yielded, or may be likely to yield, information important in prehistory or history.

Impacts to significant cultural resources that affect the characteristics of any resource that qualify it for the NRHP or adversely alter the significance of a resource listed on or eligible for listing in the CRHR are considered a significant effect on the environment. These impacts could result from "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines, Section 15064.5 [b] [1], 2000). Material impairment is defined as demolition or alteration "in an adverse manner [of] those characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the California Register…" (CEQA Guidelines Section 15064.5[b] [2] [A]).

### 2.1.2 Clean Water State Revolving Fund (CWSRF) Program

The CWSRF program is partially funded by the United States Environmental Protection Agency (USEPA) that provides low- interest financing and is administered by the Division under the California State Water Resources Control Board (SWRCB). The purpose of the CWSRF Program is to implement the Clean Water

Act and various state laws by providing low-interest financing for construction and improvement of wastewater treatment facilities.

Due to the federal nexus with USEPA, federal laws and regulations (e.g. federal cross-cutters) apply to all projects pursuing CWSRF financing. Under the CWSRF program, the Division under the State Water Board uses the CEQA document plus the federal cross-cutting documentation in place of a National Environmental Policy Act (NEPA) documents, which is defined "CEQA_Plus" documentation. The State Water Board does not complete a NEPA review process, but rather completes the "NEPA-like" process of CEQA-Plus.

#### 2.1.3 Assembly Bill 52 (AB 52) Native American Consultation & CEQA

In 2016, CEQA established a consultation process with all California Native American Tribes, including both federally and non-federally recognized tribes that are historically connected and culturally affiliated with the project location. This bill has established the TCR classification and requires consideration of Tribal Cultural Values in determination of project impacts and mitigation, requires tribal notice of the project, and requires meaningful consultation.

In accordance with PRC Section 21080.3.2(b), consultation ends when either both parties agree to mitigation measures, other agreements to avoid a significant effect on TCR's, or, when a party, acting in good faith and after reasonable effort concludes that mutual agreement cannot be reached.

### 2.2 Humboldt County

Approved by the County in May of 2012, Section 10.6 of the General Plan, Cultural Resources of the Humboldt County Conservation and Open Space Element Chapter, provides general guidance for the protection of cultural and paleontological resources within the County. Section 10.6.3 outlines the goals and policies of the County:

#### 2.2.1 Goals

CU-G1: Protection and Enhancement of Cultural Resources. Protected and enhanced significant cultural resources, providing heritage, historic, scientific, educational, social and economic values to benefit to present and future generations.

#### 2.2.2 Policies

CU-P1: Identification and Protection. The potential for significant impacts to cultural resources shall be identified during ministerial and discretionary permit review, assessed as to significance, and if found to be significant, protected from substantial adverse change.

CU-P2: Consultation. Native American Tribes (as defined), historical organizations, other interested parties, and applicable agencies shall be consulted during discretionary project review for the identification, and protection and mitigation of adverse impacts to cultural resources. Consultation on ministerial permits shall be initiated if it has been determined the project may create a substantial adverse change in the significance of a cultural resource. At their request, Tribes shall be afforded the opportunity to review and provide comments to the County early in project review and planning (screening) about known or potential significant Native American cultural resources located in project areas within their respective tribal geographical area of concern.

CU-P3: Avoid Loss or Degradation. Projects located in areas known to have historic or prehistoric ruins, burial grounds, or archeological sites shall be conditioned and designed to avoid loss or substantial degradation of these resources, including standard provisions for post-review inadvertent discoveries of archaeological or Native American remains.

CU-P4: Findings Necessary for Loss or Destruction. Cultural resources shall not be knowingly destroyed or lost through a ministerial or discretionary action unless:

1. The site or resource has been found not to be of significant value after consultation by representatives of the cultural resources community and relevant experts; or
2. There is an overriding public benefit from the project, and compensating mitigation to offset the loss is made part of the project.

CU-P5: Mitigation. Mitigation measures shall be required for any permitted project or County action that would adversely impact significant cultural resources

The General Plan also includes recommendations for implementation of these goals and policies:

- Adopt procedures for review and approval of all City-permitted projects involving ground disturbance and all building and/or demolition permits that will affect buildings, structures, or objects "identified as historically significant" (City of Eureka 1997b:5-8).
- Adopt preservation incentive programs, including the Mills Act, Historic Preservation Easement program, and Certified Local Government Program.
- "Preparation, adoption, and implementation of a cultural resources ordinance that provides definitions and standards for identification and protection of cultural resources and provides penalties for their disturbance" (City of Eureka 1997b:5-8).
- Preparation and updating of a citywide cultural resource database.

The General Plan also designates Neighborhood Conservation Areas (NCAs) within the city of Arcata as areas that are historically noteworthy where review is conducted to assure that new construction, modifications or alterations are harmonious with the existing character of the neighborhood.

## 2.3 City of Arcata Historical Preservation

The City of Arcata General Plan includes a Historical Preservation element. As the AWTF project requires a permit from the City, it is subject to compliance with this element.

The following is excerpted from the Design and Historical Preservation Element (DHPE) (City of Arcata 2010):

> "An inventory of Arcata's historical structures and sites in 1979 [Susie Van Kirk: Reflections of Arcata's History: eighty years of architecture, 1979] identified four early periods of residential building styles: settlement (1850-1885) Victorian (1885-1900), Transitional (1900-1910) and Craftsman (1910-1930), in addition to the modern period (1930-present).
>
> The City's first historic preservation ordinance [Ordinance No. 935] was adopted by the City Council in 1980. Since that time, 85 structures or sites have been formally designated by ordinance as local historic landmarks. The City retains a map of Historic Landmarks, Neighborhood Conservation Areas, and Specific

Plan Districts. [Throughout this element the name of the Historic Landmarks Commission has been changed to Historic and Design Review Commission, per Ordinance No. 1377, September 2008.]"

The Guiding Principles and Goals of the DHPE are the following:

A. Promote preservation of structures and sites that are representative of the various periods of the city's social and physical development.
B. Preserve the historical character of the Plaza and the surrounding commercial district.
C. Encourage owners of eligible structures to seek historic landmark status and to invest in restoration efforts.
D. Conserve the many examples of early residential building styles found in the city's older neighborhoods, from Bayside to Arcata Heights.
E. Assure that new construction and additions to existing historically-designated buildings maintain the character and livability of the historic neighborhoods.
F. Promote interest in and appreciation of the value of Arcata's history and its heritage of historic buildings.
G. Encourage tourism and economic development through historic resource preservation.
H. Prevent destruction of archaeological and cultural resources and assure that any artifacts receive proper disposition.

# 3.0 SETTING

The following sections provide the environmental and cultural context of the APE and ESL.

## 3.1 NATURAL SETTING

The APE is located in the Coast Range geomorphic province in northwestern California (Wagner 2002). A review of the bedrock and surficial geology of the APE and the ESL on the Redding Sheet of the Geologic Atlas of California (Strand 1962) reflects the APE & ESL as underlain entirely by Recent Alluvium deposit, which is composed of alluvium, old alluvium, and young stream terrace deposits (ibid.).

The climate of the Humboldt Bay region is classified as Mediterranean in the Köppen Climate System (Köppen 1936), with average annual rainfall and temperatures of 68 in. and 44-85 degrees Fahrenheit, respectively (WRCC 2016).

As defined by Mayer & Laudenslayer (1988), the habitat setting is Wet Meadow (WTM), Fresh Emergent Wetlands (FEW), and Saline Emergent Wetlands (SEW), hosting a diverse array of wetland plants and animals.

## 3.2 CULTURAL SETTING

Early studies of prehistoric chronological sequences on the California north coast include efforts by Loud (1918), Bickel (1979), Hayes et al. (1980), and Moratto (1984). A review of these studies by Hayes et al. (1985) cites difficulties in compiling an in-depth sequence for the coastal stretch of Mendocino County due in part to the paucity of comparative information available for the area. However, as a larger marine and intermountain region, a unified chronology is in use that spans southern coast of Oregon down to Cape Mendocino, and from the ocean east into the Klamath-Trinity Mountains.

Literature regarding prehistoric north coast settlement patterns is primarily focused on the entry of diverse groups (Fredrickson 1984). Although Whistler (1979) proposes a sequence based on language, the overall culture between diverse groups in the area is remarkably similar. There is some disagreement among archaeologists over the mode and tempo of cultural evolution on the coast. Some archaeologists are inclined to see all aspects of ethnographic culture as developing together at the same time, while others see cultural evolution on the coast as a mosaic, in which different aspects of the ethnographic pattern developed at different times and at different rates (Ames 1994). Numerous predictive models have emerged in anthropological literature over the years to analyze the validity of both arguments. Current anthropological literature strongly characterizes Northwestern Pacific California settlement patterns to be mosaic in nature.

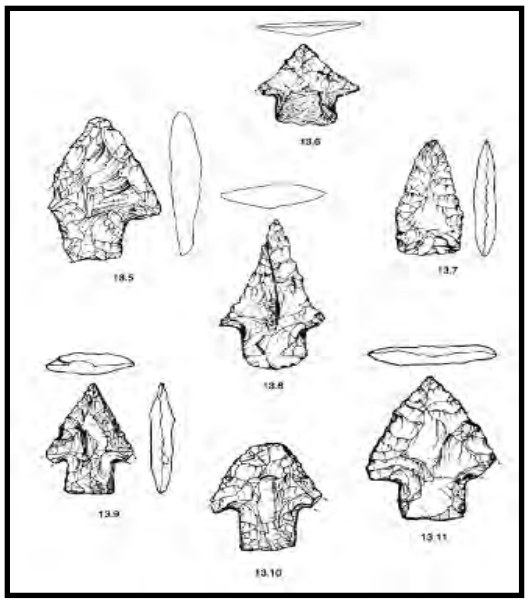

**Figure 3. Borax Wide Stem Type of the Borax Lake Pattern (Figure 13 from Justice 2002: 104).**

The major patterns noted for the region are Borax Lake (10,000 Years Before Present [BP] – 2,800 BP), Mendocino Pattern (2,800 PB – 1,100 BP), and Tuluwat (Gunther) Pattern (1,100 BP – ca. 150 BP).

Following a post-glacial warming trend, Whistler (1979) posits that the earliest migrations of human habitants to the area focused on inland riverine exploits. The earliest pattern, identified as the Borax Lake Pattern, is characterized as highly mobile family groups who utilized hunting and gathering strategies centered on migration and seasonal resources such as elk, acorns, and edible seeds (Eidsness 1988; Hayes et al. 1985). The Borax Lake Site (CA-LAK-36) is the first published archaeological work to identify the Borax Lake Pattern. It was conducted by M. R. Harrington, who claimed that the artifacts of the site were similar in age to the Clovis points found across North America, due to the fluted characteristics of the Borax Lake projectile points. This location is one of the earliest habitation sites in California; possibly as old as 12,000 BP. However, a re-examination of the site conducted by Meighan and Haynes (1968) concluded that the likely earliest dates lie between 10,000 and 8,000 BP (White 1999:9; Greenway 1988:59).

Regionally, the Borax Lake Pattern has been uncovered in the mountains of Humboldt and Mendocino Counties, Santa Rosa Plain, and most prominently in the Clear Lake Basin where assemblages are reflected by flaked stone only (i.e. wide-stemmed points [Figure 1], ovoid flake tools, and bladelet flakes) (Jones & Klar 2007:89). Artifact assemblages comprised hand-stones, milling slabs, and large wide-stemmed spear points made of locally sourced chert or obsidian. In Humboldt and Mendocino areas, obsidian is relatively rare in records from this period. Additional evidence indicates extensive use of high-elevation sites and mountain ridge systems for mobility (Wylie 1976).

Studies from Middle Period sites indicate an adaptation from mobile resource procurement to low elevation semi-permanent villages focused on salmon-bearing streams and acorn exploitation, referred to as the Mendocino Pattern. Storage practices indicate increased sedentism and a shift to bringing

resources back to a central location. This may have been influenced by a climatic shift, cooling the interior of California and resulting in declining food sources at higher elevations (Eidsness 1988; Hildebrandt & Hayes 1983, 1984). Artifact tool assemblages show enhanced diversity comprising spear and atlatl tips, increased use of slab mortars and pestles over hand-stones and milling slabs, and a diminutive refinement of point types (Eidsness 1988). Whistler (1979) suggests this is the period in which the Wiyot settled the coastal strip, indicating the Yurok arrival was nearly 200 years later.

**Figure 4. Tuluwat Pattern distribution (Map 53 from Justice 2002: 417).**

The Tuluwat (formerly known as Gunther) Pattern is set firmly in marine and estuarine practices, reflecting a similarity with greater northwest influences (Eidsness 1988). The pattern is distributed throughout the whole of Northern California and some locations in Southern Oregon (Figure 2). Artifact assemblages are characterized by enhanced woodworking skills (habitations, dugout canoes), steatite bowls and pipes, harpoon points of bone and antler, and the small, distinctive Tuluwat barbs (Eidsness 1988). Exchange networks and measures of religion and wealth are evidenced by dentalium money and large ceremonial obsidian blades, sourced from material nearly 400 kilometers distant (Eidsness 1988; Loud 1918; Hughes 1978). Baskets are a high art form, integrated for all manners of resource procurement, storage, and everyday use. Whistler (1979) credits the firm settlement of the Yurok and Wiyot with the emergence of the Tuluwat pattern and the ability to fully exploit the marine and riverine resources. Excavations show an increased complexity and options in funerary practices including pre-internment grave burning, cremation, and the destruction of personal property (Heizer and Elsasser 1964; Fenega 1968).

## 3.3 Ethnographic Background

Pre-European contact ethnographic information is presented for the Wiyot, the cultural group identified for the project location.

The Wiyot resided in and around the area encompassing the lower Mad and lower Eel rivers, and the estuaries of Humboldt Bay. According to Kroeber (1976: 112), the designation as “Wiyot" actually refers to the lower Eel river area, with proper names for the Humboldt Bay and lower Mad River districts noted as Wiki and Batawat, respectively. Kroeber defines the Wiyot territory as:

> “…just south of Little River, at whose mouth stood the Yurok town of Metsko. On Mad River, near Blue Lake, near the forks, was still Wiyot. The north fork was without villages and is in doubt. The Wiyot owned at least half the lower portion…and the whole of the drainage has been assigned to them. From Mad River south to Eel River Wiyot territory extended to the first range inland. Jacoby, Freshwater, and Salmon Creeks, Elk River and Boynton Prairie were thus Wiyot…On Eel River the boundary came at Eagle Prairie near Rio Dell. Southwest of Eel River, the Bear River Mountains separated the Wiyot from another Athabascan division,

the Mattole. The spurs of this range reach the sea at Cape Fortunas, between Guthrie and oils Creek (1976; 113)".

The traditional territory encompasses approximately 525 square miles (mi), and comprises ocean dunes, riverine and estuarine lands, foot hills, open prairies, and wooded mountains. Loud (1918) estimated the pre-contact aboriginal population to be between 800-1,000 Wiyot between the three districts. Geographically, the location is restrictive and considered culturally insular.

The Wiyot language is a member of the Ritwan group, and linguistically related to the Algonquin language of the Algic family (Golla 2007), which has roots in central and eastern North America (Gruhne 1988). For a complete discussion of structural composition and comparison see Haas (1967), Sapir (1913), and Voegelin (1942); for taxonomy see Haas (1967), Teter (1964), and Michelson (1914); for sociolinguistics see Durbin (1967), Gruhn (1988), and Kinkade & Powell (1976); for dialects and language family see and Frachtenberg (1918), and Dixon & Kroeber (1913). The Wiyot language is currently undergoing a renewal with new research, documentation, and digital interactive language tools.

According to Loud (1918), there were no formal chiefdoms, but instead families of distinction, as designated by their wealth and standing in their districts. For further discussion on geography and migration in relationship to social structure and development see Rogers et al (1990), Milke et al (1949), and Kroeber (1909). For further discussion on cultural development, kinship structures, and burial practices, see Fenega (1968) and Loud (1918).

Like their neighbors, as different resources became available throughout the year, the Wiyot broke into small family bands and traveled to various locations within their territory to fish, hunt, and gather edible and medicinal plants. Subsistence patterns tended to follow both seasonal and socially conscripted routines (Loud 1918). These seasonal rounds took them to outlying areas where they established seasonal base camps and a series of radiating temporary camps and task-related activity stations.

The Wiyot today are represented by one band in each traditional Wiyot District including the Blue Lake Rancheria, Batawat District; the Wiyot Tribe of Table Bluff, Wiki District; and the Bear River Band of the Rohnerville Rancheria. Tribal members still use this area, continue to harvest plant resources, especially for basket resources, and are manifesting a cultural resurgence within their cultural territory (Seidner 1999).

## 3.4 HISTORICAL BACKGROUND

The project area is located along the northern shore of Humboldt Bay and south of the city of Arcata. Humboldt County is closely tied to important themes in California history including early settlement, westward expansion, the Gold Rush, development of the timber industry, and early environmental activism in the City of Arcata.

### 3.4.1 The Arcata Wharf

The following information regarding Arcata's Union Wharf was extracted from Susie Van Kirk's Arcata Marsh History (2015) unless cited otherwise. Van Kirk's (2015: 5) accounting of the recognized need for construction of a commercial wharf is as follows:

> *Union Wharf. The slough did yeoman service, but some Union men saw the limitations of slough freighting and proposed a facility to serve an ocean trade. The town was growing, its merchants*

*busily filing orders for the mines in response to a demand that exceeded any previous time (Humboldt Times 16 Sept. 1854). And another industry was showing its muscle. Within four years of settlement, twenty miles of logging "railroads" were operating around Humboldt Bay where two hundred men were engaged in the woods (Humboldt Times 9 Sept. 1854). It was clear that a shipping facility for goods coming in and lumber going out would stimulate both trades, benefit the town's economy and reward its developers.*

*On November 21, 1854, mill owners Thomas Titlow and Dunbar Averill entered into an agreement with Stillman Daby, Byron Deming and Henry W. Walker, whereby Daby and partners would, within ten months, construct a wharf "from the town of Union to ship channel on Humboldt Bay." Titlow and Averill would advance them $1,500 and provide the construction lumber, consisting of three-inch planks 16 feet long and four-by-four inch scantling. The amount of lumber needed was estimated at 250,000 feet (Recorder's Office, Miscellany A: 29; amended A:31).*

*The wharf company received a Certificate of Incorporation on December 15, 1854. The Union Plank Walk Rail Track and Wharf Company declared its intention to build a walk, track and wharf from the "southwest corner of the public square in the town of Union…and running in a southwesterly direction and in a straight line across the marsh and the flats in Humboldt Bay to the ship channel…for the purpose of transporting freight and passengers over the same and for such other purposes." Incorporated for twenty years, the company had a capital stock of $15,000 divided into 60 shares and there were five directors, including Daby, president and Deming, secretary with Walker, Walter Van Dyke and J.E. Wyman as the remaining directors (Misc. A:23). Before the end of December 1854, the wharf company leased a 30 x 50 foot lot at the northeast corner of Block 153 (present site of the Arcata Post Office) from M.M. Steinthal for the construction of a warehouse, along with a right-of-way over the south half of the block (Misc. A:25).*

*The east and south halves of this block (bounded by 7th, 8th, H and I streets) served as the warehouse and depot location, first for the wharf company, later for the Arcata and Mad River Railroad, and still later as the regional bus depot. Running the track in a "straight line" from the Plaza to the wharf was no exaggeration; the wharf company was definitely committed to the "shortest-distance-between-two-points" principle. From the back of the warehouse block, the track proceeded directly to a ship channel at a 45 degree angle.*

*Crossing the block between 6th and 5th and H and I streets, the line created a pie-shaped parcel that remains today (the Marsh House). An 1887 deed describes the property as bounded on the east by the "roadbed of the Arcata and Mad River Railroad" (Recorder's Office, Deeds 23:448). Never veering an iota, the line headed directly across the marsh and mud flats to its deep-water destination. A 1947 aerial photograph provides one of the best views of that "straight-as-an-arrow" railroad.*

**Figure 5. Aerial view of Union (Arcata) and the Union Wharf circa 1947 (photo by Mel Schuster 1947, reproduced in Van Kirk 2015).**

For further details see Susie Van Kirk's 2005 paper "Arcata Marsh History: Union Wharf, Mad River Canal, Reclamation, Lumber Mills, City Designs."

# 4.0 METHODS

To obtain historical background information, archival research included an examination of multiple sources concerning known archaeological sites, historic properties, and historical activities within and/or adjacent to the APE. Repositories and agencies consulted include the following:

- The California Historical Resources Information System (CHRIS) at Sonoma State University
- The Native American Heritage Commission (NAHC)

## 4.1 NWIC ARCHIVAL RECORD SEARCH RESULTS

A record search request was sent to the CHRIS at Sonoma State University on July 18, 2019. The search included a 0.5-mi radius around the APE for previously recorded archaeological sites and previous surveys (Appendix B).

The following resources were consulted at the Northwest Information Center (NWIC):

- National Register of Historic Places – Listed and Determined eligible Properties (2012)
- California Register of Historical Resources (2012)
- California Points of Historical Interest (2012)
- California Historical Landmarks (2012)

- Directory of Properties in the Historic Property Data Files for Humboldt County (2012)
- Caltrans Local and State Historic Bridge Inventory
- Handbook of North American Indians, Vol. 8, California (1970)
- The Handbook of California Indians (1975)
- City of Arcata Historical Landmarks (South of Samoa Blvd and west of Hwy 101 only)

### 4.1.1 Previously Recorded Cultural Resources within the APE and ESL

The record and literature search revealed no previously recorded cultural resources within the APE, but one resource (site Loud 42) was previously recorded within the ESL (Table 2).

**Table 2. Previously recorded resources within the APE and ESL.**

| Resource Identifier | Resource Description; Date Recorded and by Whom | Source | NRHP/CRHR Status | APE or ESL Location |
|---|---|---|---|---|
| P-12-000100; CA-HUM-00042; Loud 42 | Village site; not occupied in 1850 nor named; Site is believed to be obliterated due to construction of South G Street and Hwy 101 (Loud 1918) | NWIC/ CHRIS | 7 Unevaluated | ESL |
| HUM 101 | Gannon Slough Bridge 4-024L (Caltrans 1986) | SHPO | Ineligible | ESL |
| None | A segment of the Northwest Pacific Railroad (T. Keefe 2006) | Keefe 2006 | 6Z – Determined Not Eligible through field survey | ESL |
| California Historic Landmark #842 | Arcata and Mad River Railroad; Union Wharf and Plank Walk Company (Unknown) | Belcher 1922; Rich 2012 | CHL Listed Resource No. 842 | APE |
| None | H.N. Ry Railroad | Belcher 1922 | Unknown | ESl |
| CA-HUM-001156 | Arcata Bay Levy | HSU-CRF | Unknown | ESL |

Resource P-12-000100 was recorded as a result of Loud's ethnographic survey of the Wiyot. Other than location data, very few details are available from the original site recording.

### 4.1.2 Prior Cultural Resource Studies within the APE and ESL

The record and literature search revealed 10 previous cultural resource studies having been conducted within the APE, and 6 previous studies conducted outside the APE but within the ESL (Table 3).

**Table 3. Previous reports within the ESL.**

| Report Number | Report Title | Date Reported & By Whom | Within APE or ESL |
|---|---|---|---|
| **S-000132** | An Archaeological Survey of the Proposed McKinleyville Sewage Collection and Treatment Facility | David A Fredrickson, Sonia Tamez, and Pamela R. Roberts, 1975 | APE |
| **S-006403** | Archaeological Survey Report for a proposed sewage collection system for Bayside in Arcata, California | Barry Kevin Douglas, 1984 | ESL |
| **S-006669** | Archaeological Survey Report, Butcher's Slough Wetlands Restoration Project, Arcata, California | Barry K. Douglas, 1984 | APE |
| **S-014210** | An Archaeological Investigation of Assessor's Parcel Number 21-184-05, Located in Arcata, Humboldt County, California | James M. Roscoe, 1992 | APE |
| **S-015199** | A Cultural Resources Study of the Proposed Marsh Commons Project, Located in Arcata, California | James Roscoe, 1993 | APE |
| **S-017469** | Historical and Technological Significance of the Humboldt Bay Jetties, Humboldt Bay, California | Carroll W. Pursell, Jr., 1981 | APE |
| **S-022314** | Archaeological Survey for City of Arcata, Janes Creek culvert and Drainage Improvements, FEMA HMGP #1008-6283 (letter report) | David Fukutomi, 1999 | APE |
| **S-029030** | Archaeological Assessment of a 1.5-Acre Parcel (APN 367-180-010), Located at 915 Deer Creek Drive, Martinez, Contra Costa County, California (letter report) | Leigh Martin, 2004 | ESL |
| **S-037718** | A Cultural Resources Investigation of the Proposed McDaniel Slough Marsh Enhancement Project, Located near Arcata, Humboldt County, California | William Rich, James Roscoe, and Susan Van Kirk, 2003 | APE |
| **S-038304** | Historic Property Survey Report for the Proposed Eureka-Arcata Corridor Projects on California State Highway 101 at Post Mile 79.9/86.3 in Humboldt County, California | Timothy Keefe, 2006 | ESL |

| Report Number | Report Title | Date Reported & By Whom | Within APE or ESL |
|---|---|---|---|
| **S-038434** | Archaeological Inventory and Evaluation for the Wal-Mart Mitigation at the Old Lynch Canyon Homestead Project, Solano County, California | Charlane Gross and Jason Coleman, 2011 | APE |
| **S-040249** | Cultural Resources Survey Report for the South G Street (Christie) WRP Project, Humboldt County, California | Jason A. Coleman | ESL |
| **S-041725** | A Cultural Resources Investigation of the Daylighting of Jolly Giant Creek Project, located in Humboldt County, California | Nick Angeloff and James Roscoe, 2004 | ESL |
| **S-041786** | Historic Property Survey, Archaeological Survey, and Historical Resources Evaluation Reports, Highway 255 Gateway Improvements, CALTRANS District 1, Humboldt County, CA | Leslie S. Heald, 2002 | ESL |
| **S-048287** | A Cultural Resources Investigation of three Coastal Access Points for the Humboldt Bay Water Trails Implementation Program, Located in Humboldt County, California | James Roscoe and William Rich, 2012 | APE |
| **S-050908** | A Cultural Resources Investigation of the Arcata Wastewater Inflow and Infiltration Project, Arcata, Humboldt County, California | Nick Angeloff and Lynette Mullen, 2016 | APE |

The 1975 cultural resources study by Sonoma State's David Fredrickson, Sonia Tamez, and Pamela R. Roberts (Report number S-000132; Fredrickson et al., 1975) included work in the project APE. This study encompassed 3,660 acres and 25.5 linear miles and identified four cultural resources. However, none of these resources were identified within the ESL of this project.

Barry Kevin Douglas conducted two cultural resources studies in 1984, one within the APE (S-006669) and one within the ESL (S-006403). Report S-006403 describes a survey completed for installation of a sewage collection system for Bayside Arcata (Douglas 1984A), while report S-006669 details a 30 ac wetlands restoration project within the APE. One cultural resource was identified as a result of this investigation, site Loud 42 (P-12-000100), which is located within the project APE (Douglas 1984B).

James M. Roscoe and associates conducted five cultural investigations in the area during the 1990s and early 2000s. Report S-014210 details a cultural resources study that was completed for a 0.3 ac accessor's parcel, on which no cultural resources were identified (Roscoe 1992). Report S-015199 details a cultural resources study that was completed for a Marsh Commons project consisting of 1.5 ac, in which no cultural resources were identified as a result for this investigation (Roscoe 1993). Roscoe along with

William Rich and Susie Van Kirk conducted a cultural resources study for the proposed Slough Marsh Enhancement project in Arcata, in which three cultural resources were identified. Loud 42 (P-12-000100) was noted within the project APE (Roscoe et al 2003). Report S-041725 details a cultural resources study that was completed by Humboldt State University, in which no cultural resources were identified (Angeloff and Roscoe 2004). Report S-048287 details a cultural resources study that was completed for implementation of Humboldt Bay Water trails. No cultural resources were identified as a result of this investigation (Roscoe and Rich 2012).

Report S-017460 details a cultural resources study that was completed for determination of historical significance of the Humboldt Bay Jetties, in which no cultural resources were identified (Pursell 1981). Report S-022314 details a cultural resources study that was completed for drainage and Culvert Improvements for FEMA work in Arcata. No cultural resources were identified as a result of this investigation, neither of which are within the project's ESL (Fukutomi 1999). Report S-029030 details a cultural resources study that was completed for 1.0 ac accessor's parcel, in which no cultural resources were identified (Martin 2004). Report S-050908 details a cultural resources study that was completed for the Arcata Wastewater Inflow and Infiltration project, in which twenty-nine cultural resources were identified. Loud 42 (P-12-000100) is the only cultural resource identified within the APE (Angeloff and Mullen 2016).

Report S-038434 describes the cultural resources study completed for an inventory and evaluation of the Old Lynch Canyon Homestead. A single cultural resource was identified, which is located outside the project's ESL (Gross and Coleman, 2011). Coleman also conducted a cultural resources study for the South G Street WRP project, in which no cultural resources were identified (Coleman 2013).

Caltrans completed two cultural resources studies in the area during the early 2000s. Report S-038304 (Keefe 006) details a cultural resources study that was completed along 4.5 linear miles for the proposed Eureka-Arcata corridor along California State Highway 101. Eleven cultural resources were identified as a result of this investigation, but all are located outside of this project's ESL. However, this report also determined that the Arcata Wastewater Treatment plant was found Ineligible for inclusion in the National Register at that time. Report S-041786 (Heald 2002) describes the cultural resources study completed for Highway 255 Gateway improvements. Seventeen cultural resources were identified as a result of this investigation, but none within this project's ESL (Heald 2002).

## 4.2 Native American Coordination

In accordance with PRC § 5097.91-5097-94, the Native American Heritage Commission (NAHC) maintains a catalog pertaining to places of special religious or social significance to Native Americans. In order to identify if places of religious or social significance exist within the APE, DZC contacted the NAHC on August 30, 2019 to request a review of their Sacred Lands Files.

The NAHC responded by email on September 19, 2019, stating that the Sacred Lands File search was negative and provided a list of individuals to be contacted regarding the project.

PRC § 21080.3.1, subd. (b), declares that California Native American Tribes traditionally and culturally affiliated with a geographic area may have expertise concerning their tribal cultural resources. As such, DZC contacted persons on the designated contact list maintained by the NAHC, providing each with a

project description, location map, a request to respond to DZC with any relevant information, and a request to respond to the lead agency within 30 days, should the tribe wish to engage in formal government-to-government Consultation. Email or hard-copy notifications were sent to all parties on the NAHC list on October 10, 2019.

Janet Eidsness, THPO of Blue Lake Rancheria responded on October 11, 2019. THPO Eisdness acknowledged the proximity of P-12-000042 (CA-HUM-00042/Loud 42) within the ESL, concurred that the resource is outside of the APE, and offered that Blue Lake Rancheria had no knowledge of any additional sites in the APE.

As of October 31, 2019, no response was received from (1) Bear River Band of the Rohnerville Rancheria: Barry Brenard, Chairperson; Celeste Ruiz, Executive Secretary; and Erika Cooper, THPO; (2) Cher-Ae-Heights Indian Community of the Trinidad Rancheria: Claudia Brundin and Garth Sundberg, Sr., Chairpersons; and (3) Wiyot Tribe: Ted Hernandez, Chairperson.

Formal government-to-government Consultation, as defined by PRC § 21080.3.1 (a), is the purview of the lead agency, the City of Arcata. Records pertaining to formal consultation are on file with the City of Arcata. All correspondence regarding Native American coordination conducted by DZC is included in Appendix C.

## 4.3 Parcel Specific History

The following sections detail initial land ownership and development of the APE utilizing public records and historical maps, followed by an analysis of topographic maps, aerial photographs, and satellite imagery.

### 4.3.1 Initial Land Ownership and Development

The historic map review included analysis of the A. J. Doolittle Map (1865), the Stanley Forbes Company map (1886), the J.N. Lentell map (1914), and the Belcher Abstract & Title Company map (1922).

The A. J. Doolittle (1865) indicates that the APE and surrounding area had been moderately surveyed by 1865. The depiction of Northern Bay has several noted landmarks surrounding the APE, but not within the APE. The majority of the project area was historically a marsh. Along the immediate western boundary of the APE, a railroad extends into Humboldt Bay. Although it is unclear on Doolittle's map if it overlaps the APE, the landowner along the

**Figure 6. Northeastern shore of Humboldt Bay circa 1865 (Doolittle 1865).**

marsh boundary is “Phillips” (Doolittle 1865).

The Hickey and Standish (1895) map does not indicate a landowner for the APE in 1895. The J.N. Lentell (1914) map does not indicate a landowner for the APE in 1914. However, two railroad lines are depicted as extending through the APE and ESL including a segment of the Arcata and Mad River Railroad (Union Wharf and Plank Walk Company, California Historic Landmark No.842) and a segment of the Northwestern Pacific Railroad.

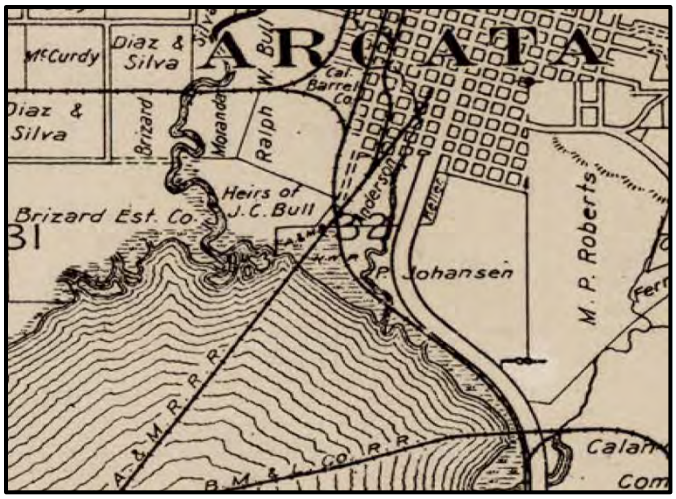

**Figure 7. Northeastern shore of Humboldt Bay circa 1922 (Belcher Abstract Title Company).**

The Belcher Abstract & Title Company map (1922) depicts several landowners along the northern shore of Humboldt Bay associated with the APE. The Annie and Mary Railroad owned property directly on the shore of Humboldt Bay and owned the railroad line that extended northeast-southwest into the Bay (Union Wharf and Plank Walk Company, California Historic Landmark No.842). A segment of the Northwestern Pacific Railroad is also depicted within the APE and ESL. Neighboring landowners in or near the APE included Heirs of J.C. Bull, Ralph W. Bull, and P. Johansen.

See Appendix D for the approximate location of the APE on these historical maps.

A state volume patent and a serial patent were issued for the APE the 19th and 20th century. Below is a table detailing state volume patents and serial patents within the project’s APE and ESL (Table 4). Historical documents regarding the development of the APE and ESL are included in Appendix D.

**Table 4. State volume patents and serial patents within the project APE and ESL.**

| Name | Date | Quadrant | Township/Range/Section | GLO Source | Project Segment overlap |
|---|---|---|---|---|---|
| State of California | January 12, 1903 | Arcata South | T6N/R1E/ Section 32 | Serial Patent; GLO 1903 | Study Unit 1, 2, 3, 4, and 5 |
| Marc Teremater | November 11, 1867 | Arcata South | T6N/R1E/ Section 32 | State Volume Patent; GLO 1867 | Study Unit 1 |

### 4.3.2 APE Parcel Specific Topographic Maps and Aerial Photographs

Utilizing the National Environmental Title Research (NETR) website, DZC reviewed the USGS topographic maps of the APE and ESL. The USGS maps are hereby referred to as NETR (1933, 1942, 1948, 1953, 1961,

1966, 1972B, 1974, 2012B, 2015) and encompasses Arcata South 7.5-minute quadrangle map Township 6 North, Range 1 East, Section 32 and Township 5 North, Range 1 East, Unsectioned and all four previously designated polygons pertaining to the APE (Table 1).

In 1933, two prominent linear landmarks are demarcated on the historical topographic map while the majority of the APE is designated as marshland. The Arcata and Mad River Railroad line or wharf runs in a northeast-southwest direction along the APE's northwestern boundary. The Redwood Northwestern Highway is adjacent to the APEs eastern boundary. A clearly delineated grid system is established in Arcata and is featured within the projects northern ESL (USGS 1933). Between 1948 and 1953, three buildings are constructed adjacent to Study Unit 1 and three ponds, designated as reservoir, are established near Study Unit 1 and 2, but within the ESL (USGS 1948, 1953). By 1961, the "Oxidation Pool", which encompasses the southern portion of the APEs Unit 5, is established. Two of the three ponds built between 1948 and 1953 are merged into one pond by 1961 (USGS 1961). Just five years later in 1966, several buildings are constructed on the eastern side of the Redwood Highway within the ESL as well as a Radio Tower. Within the APE, the Oxidation Pond, previously built facilities, and two smaller ponds are labeled Sewage Disposal (USGS 1966).

Between 1972 and 1974, the northern portion of Study Unit 5 is no longer labeled as marshland and has a clear boundary around what will eventually become Klopp Lake. The previously labeled Arcata and Mad River Railroad line is labeled Wharf (Ruins) by this time and part of the railroad along the APEs eastern boundary is labeled Northwestern Pacific Railroad (USGS 1972B, 1974). In 2012, the area encompassing the northern portion of Study Unit 5 is labeled Jolly Giant C and is situated between roads Marina W. and South G St, which are within the western and eastern portion of the ESL (USGS 2012). By 2015, no significant changes are demarcated except a large pond, which is located in the northern portion of Study Unit 5 (USGS 2015).

DZC also examined aerial photos of the APE from the NETR website (1956, 1972A, 1989, 1993, 2005, 2009, 2010, 2012A, 2014, 2016). The earliest aerial photographs of the area, from 1956, are poor quality. What can be demarcated on the landscape shows that Study Unit 5 is a combination of marshland, mud, and vegetation. A single structure is located between Study Units 2 and 5 within the ESL (USGS 1956). By 1972, all of the ponds within the APE, including the Oxidation Pond, are clearly demarcated on the landscape as well as some smaller buildings near Study Unit 2 and a few dirt roads, but none of which are well developed (USGS 1972A). By 1989, the APE and surrounding area are far more established as evidenced by clear pond designations and buildings, which are concentrated near Study Units 3 and 5. The Oxidation pond has also been internally divided into 13 rectangular polygons (USGS 1989). No significant changes occur within the APE or ESL until 2016, in which green vegetation becomes more prominent in the surrounding ESL (USGS 2010, 2012A, 2014, 2016).

Satellite imagery from Google (2016) indicates that several of the ponds have designated names. Within Study Unit 2 is east of the South G Street Storm Water Pond, Study Unit 3 is located adjacent to No-name Pond, and Study Unit 5's southern portion is designated as North Oxidation Pond and South Oxidation Pond. Study Unit 5's northern portion encompasses Hauser Marsh along South I St. and Gearheart Marsh. Several structures are located within the ESL east of South G St (Google 2016).

### 4.3.3 THE ARCATA MARSH - ENVIRONMENTAL INNOVATION

The following summary of the social justice aspects and physical processes of the AWTF is summarized from a manuscript written by Amanda Suutari, published in June 2006.

In 1972, Federal Water Pollution Control Act Amendments called for the improvement of the water quality in Humboldt Bay and at that time, Arcata's former wastewater treatment plant was not adequately treating the city's wastewater. Originally constructed in the 1940s, wastewater discharged into the bay from the treatment plant received only primary treatment. The facilities were expanded in 1958, which increased the level of treatment by adding chlorination. However, by 1974 these processes were not only deemed inadequate by the standards of the Water Pollution Control Act Amendments of 1972 but were also becoming socially unacceptable when considering sustainable fisheries and other aquatic life. By 1974, the City of Arcata and its community entered into the "Wastewater Wars" when the State and Regional Governments proposed a wastewater treatment plant that would serve Arcata as well as other areas on the bay, a project that would make the rural region vulnerable to strip development and increased sewage disposal costs.

In the spirit of local activism, community members had recently created the first Community owned forest in the country and prevented a new federal freeway from further bisecting their town. Riding that wave with the backing of local notables including Dr. George Allen, Dr. Robert Gearheart, Dan Hauser, and Franklin Klopp, the citizenry focused on creating the Arcata Marsh and Wildfire Sanctuary and proving to State and federal government agencies that the facility's wastewater would "enhance" the bay (Esther Scott et. al. 1989). The overall goal was to remove the remnants of the derelict lumber mill and associated ponds, compromised concrete foundations, and the unkempt landfill and replace it with the wastewater treatment plant that would remain independent while providing wildlife habitat and recreational opportunities. Primary processes included industrial remediation by the National Guard, installation of temporary dikes, sediment removal, terraforming, and native plant revegetation.

The resulting infrastructure currently supports primary treatment, which separates liquids from solids, and secondary treatment, which addresses harmful pathogens. Major components include the headworks, primary clarification retention facilities, digesters, oxidation ponds, treatment marshes, and disinfection prior to final discharge into enhancement marshes.

The initial AWTF was completed in 1986 with subsequent expansions of 3.51 ac funded by the California State Coastal Conservancy and the addition of the Arcara Marsh Interpretive Center in 1993. The marsh complex today is internationally renowned as a first-class example of an innovative, cost effective, environmentally integrated facility.

For further details regarding the historic, political and industrial processes surrounding the formation of the AWTF, the reader is referred to the full publication by Amanda Suuti, included in Appendix D.

## 4.4 GEOARCHAEOLOGICAL RESEARCH

To assess the potential for buried archaeological sites within the proposed project components, this assessment considers factors that either encourage or discourage human use or occupation of certain landforms (e.g., geomorphic setting and distance to water), combined with those that affected the subsequent preservation (i.e., erosion or burial) of those landforms. It is well-known, for instance, that

prehistoric archaeological sites in California are most often found on relatively level landforms near natural water sources (e.g., springs, streams, rivers, or estuaries), which is often where two or more environmental zones (ecotones) are present. Landforms with this combination of variables are frequently found at or near the contact between a floodplain and a higher and older geomorphic surface, such as an alluvial fan or stream terrace (Hanson 2004:5).

An attempt is given to forecast the burial sensitivity by looking at the intersection of existing geomorphic, stratigraphic, soils spatial variables, land use, and past impacts as well as any behavioral variables that may forecast human occupation. The following describes the project site in terms of these variables and generates an archaeological sensitivity forecast. This is not an analysis of whether a particular area was attractive for human activity, but whether the conditions are favorable for buried archaeological deposits.

Soil Composition

A review of the USDA Soil Survey Geographic Database Soil Series for Humboldt County, California (CA600) revealed that 92% of the APE consists predominantly of Miscellaneous Water and Water. The remainder includes Urban land-Anthraltic Xerorthents association (0-2% slopes), and Hydraquents (0-3% slopes) (USDA 2019). Together with water dominating the majority of the APE, these two soil families represent 8% of soils found in the APE.

The Urban land-Anthraltic Xerorthents soil type is found in the central part of the APE and is associated with Fluviomarine terraces and backslopes. The parent material consists of coarse-loamy fluviomarine deposits and/or coarse-loamy dredge spoils (USDA 2019). Depth to the water table is roughly 24 in. and this class is moderately well-drained. Water movement in the most restrictive layer is high (ibid.). A typical soil profile for this soil type reads 1.) 0-6 in.: gravely loam fine sand; 2.) 6-31 in.: sandy loam; 3.) 31-43 in.: gravelly sand; and 4.) 43-65 in.: sand (ibid.).

The Hydraquents-Wassents soil type is found the central and western portion of the APE and is associated with tidal flats. The parent material consists of mucky, silty, and clayey estuarine deposits (ibid.). Depth to restrictive layer is 0 in. to aslic and 20 to 79 in. to sulfuric and this class is very poorly drained. The depth to water table is about 0 inches (ibid.). A typical soil profile for this soil type reads 1.) 0-59 in.: mucky silty clay loam (ibid).

These two soil profiles together form approximately 100 percent of the recorded surface in the APE that is not water. Within the APE, Meyer's predictive model (Meyer et al. 2013:102) for surface deposit potential in the aquatic terrain is moderately high to high based on favorable distance to water, low elevations below 4,000 ft, 0- to 3-degree slopes, proximity to waterways confluences, and slightly convex or concave landforms. The age of the two soil types present, which are Urban land-Anthraltic Xerorthents and Hydraquents-Wassents, is recent (Meyer et al. 2013, Appendix B).

### 4.4.1 HYDROLOGY OF THE ESL

With reference to the USGS 7.5-minute Topographic Map, Arcata South (1959), the directional groundwater flow through the APE is westward towards the Pacific Ocean. The Federal Emergency Management Agency national flood hazard map does indicate the APE to be within the path of a 100-year flood event (FEMA 2016).

### 4.5 Cultural Resource Survey Expectations

The results of archival research, the Sacred Lands Search, previous surveys adjacent to and within the study area, and the environmental context all contribute to an assessment of the sensitivity level for a given project area. Based on the geomorphological and topographic characteristics of the project area, the results of the records and literature search, the age the soils mapped in the area, and the level of historic disturbance, the APE is considered to have a low potential for buried and surficial prehistoric resources, a moderate potential for buried historic resources, and a low potential for surficial historic resources.

## 5.0 Report of Findings

### 5.1 Archaeological Survey Results

DZC conducted the archaeological survey of the APE on October 9, 2019 and on November 5, 2019. Within the APE, designated project Study Units 1-5 were targeted for archaeological survey coverage, which includes Staging Areas 1-4 (Appendix A, Figure A-7). The City of Arcata identified 123 ac of land for Intensive survey.

The primary constraint to survey efforts was poor ground visibility. Generally, ground visibility was less than five percent since most surfaces were either paved, vegetated, or covered with imported gravel. To circumvent this, vegetation was scraped clear at select intervals to obtain a clear view of the mineral surface. This method was employed in other areas within the APE where low-lying and dense vegetation was present. Some soils were occasionally visible because of gopher holes and occasional bare patches of ground without vegetation cover. The soils observed varied greatly and included light sandy loam, dark loam aggregated rounded and subangular cobbles associated with commercial imported gravels. Fragmentary refuse, including crushed cement tailings and modern broken glass, were observed but not in sufficient quantities to obtain interpretive data aside from industrial use association.

In Staging Area 1 poor visibility was due to low-lying dense vegetation and surfaces covered with imported gravel. Staging Area 2 provided similar constraints to survey efforts with poor visibility due to paved asphalt and low dense vegetation surrounding the Arcata Marsh Parking lot on South G Street. Constraints of Staging Area 3 included the presence of low dense vegetation, briars, and imported gravels. Staging area 4 constraints were similar to those of Staging Area 2, with paved asphalt and low dense vegetation surrounding the Arcata Marsh Parking lot on South I Street.

Pedestrian survey efforts resulted in 100% coverage of the target acres excluding wetlands, ponds and marshes, and provided intensive coverage in transects of 15 m or less for all acres covered (Appendix A, Figure A-7 Survey Coverage and Results).

The survey was negative for precontact resources. Two built environment features were identified within the APE including the AWTF and a remnants of the Arcata Mad River Railroad/Union Wharf and Plank Walk Company.

# 6.0 RESOURCE DISCUSSION

## 6.1 RESOURCE EVALUATION CRITERIA

### 6.1.1 NATIONAL REGISTER OF HISTORIC PLACES

To be eligible for listing on the National Register, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Districts, sites, buildings, structures, and objects of potential significance must meet one or more of the following four established criteria:

- Criterion A - Are associated with events that have made a significant contribution to the broad patterns of our history;
- Criterion B - Are associated with the lives of persons significant to our past;
- Criterion C - Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master; or that possess high artistic values; or that represent a significant and distinguishable entity whose components may lack individual distinction;
- Criterion D - Have yielded, or may be likely to yield, information important in prehistory or history.

In addition to meeting one or more of the above criteria, a resource must retain integrity to be considered eligible for listing on the NRHP. Integrity is the authenticity of the physical identity that is evidenced by the survival of characteristics that existed during the resource's period of significance. The seven aspects of integrity are outlined in the National Register Bulletin No. 15 and consist of: location, design, setting, materials, workmanship, feeling, and association (Shrimpton 2002). Resources must retain enough of their character or appearance to be recognizable as resources and to convey the reasons for their significance. Further, unless the resource possesses exceptional significance, it generally must be at least 50 years old to be eligible for National Register listing.

Section 101(d)(6)(A) of the National Historic Preservation Act (NHPA) allows properties of traditional religious and cultural importance to a Native American tribe to be determined eligible for NRHP inclusion. In addition, a broader range of Traditional Cultural Properties (TCPs) is also considered and may be determined eligible for or listed in the NRHP. A TCP is a property associated with the cultural practices or beliefs of a living community; TCPs are rooted in that community's history and are important in maintaining the continuing cultural identity of the community. In the NRHP programs, "culture" is understood to mean the traditions, beliefs, practices, lifeways, arts, crafts, and social institutions of any community, be it a Native American tribe, a local ethnic group, or the nation as a whole.

### 6.1.2 CALIFORNIA REGISTER OF HISTORICAL RESOURCES

As provided in California Public Resources Code Section 5020.4, the California Legislature established the CRHR in 1992. The CRHR is used as a guide by state and local agencies, private groups, and citizens to identify the state historical resources and properties to be protected, to the extent prudent and feasible, from substantial adverse change. The CRHR automatically includes all California properties already listed in the NRHP and those formally determined to be eligible for listing in the NRHP. The CRHR may also include various other types of historical resources that meet the criteria for eligibility, including the following:

- Individual historic resources
- Resources that contribute to a historic district

- Resources identified as significant in historic resource surveys
- Resources with a significance rating of Category 3 through Category 5 in the State Inventory (Categories 3 and 4 refer to potential eligibility for the NRHP; Category 5 indicates a property with local significance)

The CRHR follows the lead of the NRHP in utilizing the 50-year threshold: a resource is usually considered for its historical significance only after it reaches the age of 50 years. This threshold is not absolute, but was selected as a reasonable span of time after which a professional evaluation of historical value/importance should be made. The criteria for listing resources in the CRHR were expressly developed to be in accordance with previously established criteria developed for listing on the NRHP.

Section 15064.5(a)(3) of the CEQA Guidelines states that "Generally, a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources," which are as follow:

- Criterion 1 - Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
- Criterion 2 - Is associated with lives of persons important in our past;
- Criterion 3 - Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- Criterion 4 - Has yielded, or may be likely to yield, information important in prehistory or history.

Using the information outlined above, the first level of evaluation is to determine whether a resource is considered eligible for the CRHR and is, therefore, significant. Significance, in part, is determined based on a historical resource's integrity. Integrity in the context of the CRHR means a resource is sufficiently intact to yield important information regarding the past. Integrity encompasses the following factors: location, setting, design, materials, workmanship, association, and feeling.

## 6.2 Resource Evaluation

### 6.2.1 AWTF Infrastructure

The AWTF was initially constructed in the 1940s with various parts of the system being replaced or improved multiples times since that time. With respect to the AWTF's cultural significance, wastewater treatment facilities are ubiquitous features found in most cities and towns. No evidence has been found to suggest that the initial construction and materials used in the AWTF are in any way unique. Further, ongoing repairs and maintenance continue to upgrade and improve the design, workmanship, and material qualities of the original construction. However the expansion of the AWTF in 1986 may represent both an innovative design, which may be considered a unique construction method, and social justice activism associated with the City of Arcata. As such, this discussion regarding the criteria for evaluation aims to identify persons and events relative to the AWTF.

NEPA and CEQA mandate that resources older than 50 years may qualify for eligibility on the National Register of Historic Places or the California Register of Historic Resources.

A/1: AWTF was originally constructed in in the 1940s in order to facilitate wastewater disposal for the City of Arcata. Since that time, it has undergone multiple modifications and improvements, however the processes remain true to the original idea. Wastewater treatment plants are ubiquitous facilities found throughout most towns and cities. However, research has shown that the AWTF is associated with significant local events of environmental activism. Projects occurring within the AWTF post-2036 should consider evaluation of the facility for the NRHP/CRHR.

B/2: Research has shown four figures of historical significance to be related to the construction of the AWTF or its operation. Dr. George Allen, professor and Fisheries Sciences at Humboldt State University; Dr. Robert Gearheart, professor of Environmental Engineering at Humboldt State University; Mr. Dan Hauser, City Council Member and Mayor of the City of Arcata from 1974-1982; and Mr. Frank Klopp, City Engineer since 1968 and Director of Public Works. These individuals were part of the seminal force for the formation of the water treatment plant and several ponds and marshes within the AWTF are named in their honor. Subsequent evaluation efforts warrant further investigation into the roles and responsibilities these individuals had into the formation of the AWTF.

C/3: The materials and construction of the AWTF is considered typical. The treatment plant does not embody a distinctive characteristic of a type, period, or method of construction, does not represent the work of a master; does not possess high artistic values. However, upon reaching the threshold for evaluation in 2036, the facility may represent a significant and distinguishable entity whose components may exhibit engineering distinction.

D/4: The AWTF is regularly maintained and is currently used for treating wastewater derived from within and near the city limits. This facility is unlikely to yield information important in prehistory or history.

NEPA and CEQA mandate that resources older than 50 years may qualify for eligibility on the National Register of Historic Places or the California Register of Historic Resources. Although the plant does not currently meet the age threshold for evaluation consideration, projects undertaken after 2036 may require formal evaluation of the AWTF.

In 2006, Tim Keefe (Senior Environmental Planner and Archaeologist/Caltrans, District 1) determined the AWTF as Ineligible for inclusion in the National Register. This assessment still stands and no additional information value is expected to be provided by facility at this time.

### 6.2.2 Arcata and Mad River Railroad/union Wharf and Plank Walk Company – California Historic Landmark No. 842 (CHL 842)

The background literature review and historic photo analysis revealed that the historic alignment of the Arcata Mad River Railroad - Union Plank Walk and Wharf Company, California's first organized railroad (formally designated CHL 842) built circa 1855, traverses Study Units 1 and 4. The review also indicated that Study Unit 1/Staging area 1 underwent major remediation to remove industrial contaminants and structures. The remediation efforts, along with the construction of the Arcata Marsh, resulted in the removal of all terrestrial features associated with CHL 842 formerly within the APE. The remnant pilings of CHL 842 are located in the waters of Humboldt Bay, outside of the APE.

As a California Historic Landmark Listed resource, no further evaluation is warranted at this time.

As Study Area 1/Staging Area retains no remnants of CHL 842, and Staging Area 4 is completely paved over, this study determines that current Project plans to use these areas for the temporary staging of equipment and materials has no potential to impair any aspect of the historic significance of CHL 842.

# 7.0 Recommendations and Conclusions

## 7.1 CEQA - Finding of No Impacts

CEQA aims to "develop and maintain a high-quality environment now and in the future, and take all action to protect, rehabilitate, and enhance the environmental quality of the state (PRC § 21001)". Historical and tribal cultural resources are part of the environment and as such, a project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment.

One historical property alignment is mapped within the APE (CHL #842). The portion of the property within the APE is limited to a mapped alignment and as such retains no physical remnants within the APE. The remaining physical features associated with CHL #842 are located outside of the APE. Additionally, Project activities in the vicinity of the mapped alignment will not cause sub-surface disturbances. Therefore, this study concludes a **Finding of No Impacts** to historic resources as defined by PRC § 5024.1, Title 14 CCR, Section 482.

## 7.2 NEPA – Finding of No Effects to Historic Properties

This Project is funded in part by State Revolving Funds Program. As such, the project is considered a Federal undertaking and is subject to NEPA and NHPA (as amended, 16 United States Code [USC] 470f). Cultural resources are considered during federal undertakings under Section 106 of NHPA, through its implementing regulations at 36 CFR 800 (Protection of Historic Properties).

One significant historic property alignment is mapped within the APE (CHL #842). The portion of the property within the APE is limited to a mapped alignment and as such retains no physical remnants within the APE. The remaining physical features associated with CHL #842 are located outside of the APE. Additionally, Project activities in the vicinity of the mapped alignment will not cause sub-surface disturbances. Therefore, this study concludes a **Finding of No Effects** to Historic Properties as defined by 36 CFR 800.16 (i).

## 7.3 Native American Consultation & Coordination

As a result of initiating a Sacred Land File & Native American Contacts List Request with the NAHC, DZC has contacted the tribes identified with the APE requesting knowledge of, or concerns for, cultural resources within the APE and Project vicinity.

Communications with, and responses from, the Native American community are included in Appendix B.

The outreach conducted by DZC may be considered Native American coordination. Coordination seeks to solicit information, build partnerships, and identify if and when formal Consultation is needed. Coordination does not substitute for Native American Consultation as defined by Section 106 of the NHPA, which requires government-to-government communications between tribal entities and the Lead Agency.

As the Lead Agency, it is the responsibility of the City of Arcata to formally engage in Consultation with the APE affiliated cultural groups.

## 7.4 Management Considerations

DZC recommends the project proceed with the following stipulations, which should be included on all project plans:

1. It is best practice to avoid cultural resources whenever possible. In cases of inadvertent (unplanned) discovery of cultural resources or human remains, the following procedures are required:
    a. If buried cultural materials are encountered during construction, it is required that work stop in that area until a qualified archaeologist can evaluate the nature and significance of the find [CCR 15064.5(f)].
    b. Immediately notify a qualified archaeologist to evaluate the nature and significance of the find [36 CFR 800.13]. A local archaeologist may be contacted at:

DZC Archaeology and Cultural Resource Consulting, LLC
445 I Street, Suite 204
Arcata, CA. 95521
707-599-9842
dimitra@dzcarc.com

2. If human remains are encountered during future construction, it is required that work stop immediately in that area and notification be made to the Humboldt County Coroner (CCR 15064.5(e) (1) (A); HSC Sec.7050.5).
3. Contact information for the Chief Deputy Coroner office at the time of this report:

Ernest Stewart
Humboldt County Chief Deputy Coroner
3012 I Street, Eureka, CA. 95501
Phone: 707-445-7242

4. If the coroner determines the remains to Native American, the Coroner shall contact the NAHC within 24 hours and collaboratively determine the Most Likely Descendant (CCR 15064.5(e)(1)(B)

The information and results contained in this document are based on the existing information provided to the archaeological firm as of August 29, 2019. Additional survey will be required if the project changes to include areas not previously surveyed.

RE: Arcata Wastewater Treatment Facility Improvements, Humboldt County.

Dear Ms. Zalarvis-Chase:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information. If you have any questions or need additional information, please contact me at my email address: katy.sanchez@nahc.ca.gov.

Sincerely,

Katy Sanchez

**FROM:** Dimitra Zalarvis-Chase, Archaeologist

**EMAIL:** dimitrazc@gmail.com

**PHONE:** (707) 599-9842

**PROPOSED PROJECT:** Arcata Wastewater Treatment Facilities Improvements

**SITE LOCATION:** Arcata South 7.5-Minute Quad; T6N, R1E, Section 32

**SITE SIZE:** 295 ± acres

DZC Archaeology and CRM Consulting is conducting the necessary records search and comment solicitation pursuant to the California Environmental Quality Act, and AB 52.

The proposed project is to improve the Arcata Wastewater Treatment Facilities infrastructure with the addition of a new secondary treatment system.

We would appreciate any information you could provide regarding known cultural resources in the project vicinity. If we have not received a response within 30 days from the date of this letter, we will assume you have no concerns or information to provide.

If this project is outside of your tribal area of sensitivity, please **also** contact the Native American Heritage Commission to refine your area of concern and avoid unwanted project notifications.

Thank you for your assistance.
Dimitra Zalarvis-Chase

## How a vicious cycle can become virtuous

### by Amanda Suutari and Gerald Marten

The cicadas are in full voice on a sultry morning in May as we make our way along a rickety wooden boardwalk that snakes through a community mangrove forest near Thung Dase village in southern Thailand. The mangroves offer welcome shade near a dock where a small boat is moored. Handmade bamboo traps are set to catch mud crabs when the tides go out. In a flash of orange and turquoise, a kingfisher swoops to a low-hanging branch.

It's hard to imagine that three decades ago the area's lush abundance was collapsing into a wasteland. "At one time," recalls Nom Ham Yak, chair of the forest's management committee, "our economic base was crabs, fisheries, and rubber. Then areas were leased as concessions to private contractors to clear for charcoal, and the forest became badly degraded."

The prospects for the area's villages were so bleak that a revival would have seemed a fantasy. What brought them back from the brink was an Eco Tipping Point.

Eco Tipping Points offer a new paradigm for restoring our communities, both natural and human. Conventional approaches to ecological problems – from piecemeal micromanagement, to techno-fixes, to top-down regulation – often fail or generate new messes. But Eco Tipping Points show how the same forces that endanger environments and communities can be harnessed to heal them.

To demonstrate what Eco Tipping Points are and how they work, consider two very different stories from two continents: the mangrove forests of Trang Province and the marshes of Arcata, California.

## From charcoal to pink gold

Five hundred thirty-five miles south of Bangkok, Trang Province is located on Thailand's southwest coast at the western shore of the Andaman Sea. Thung Dase and its neighboring villages lie in the watershed of the Palian and Trang Rivers, which drain into the sea from the Bandthad mountain range. The villages cluster along the mangrove-lined coastal wetlands, providing a fertile buffer zone for marine and terrestrial life. Besides offering a rich variety of foods, mangrove forests supply medicinal plants and materials such as thatch for housing and fishing gear. They are also refuges and nurseries for juvenile fish, crabs, shrimp, and mollusks.

Big changes came in the 1960s, when the Thai government embraced the Western model of export-led development. Industrial trawlers freely violated the no-fishing zone two miles from shore. They ravaged the sea bed and coral reefs, swallowing fish stocks faster than they could regenerate. As their coastal fishery waned, fishers spent more time on their boats and went further from shore. Some used explosives or poisons to harvest the remaining fish, or invested in better fishing equipment – causing stocks to plummet even faster.

Meanwhile, the government had granted mangrove concessions to the private sector to make charcoal briquettes. As mangroves dwindled, so did the diverse and useful products they provided. "Plants and animals, especially crabs, became scarce," explains Nom Ham Yak.

Their options narrowing, fishers began accepting menial jobs cutting mangroves for charcoal, working on commercial trawlers, or migrating into nearby cities for work. "Fishing incomes went down," Ham Yak says. "The people in the village had to leave for towns to find work in fish-canning factories, rubber-tapping plantations, general day labor, or construction. When the men went out to work and the wives stayed in the village, family relations would suffer. People also started selling pieces of land because there was no work at that time."

Worse, development agencies and banks had begun promoting shrimp farming in the mangrove forests. Unfortunately, the 'pink gold' of shrimp aquaculture can be a classic boom-bust venture in which the production from a shrimp pond declines drastically after the first five years. Local people discovered that initial quick returns were supplanted by mounting debts and environmental ruin as abandoned shrimp ponds spread across the landscape.

In 1999, a team led by economist Suthawan Sathirathai did a cost-benefit analysis of shrimp farming on a ▶

coastal village in Surathani Province, southern Thailand, to compare the monetary value of mangroves versus shrimp farms. When taking into account only marketable products, shrimp farms brought higher returns, with a net value of $9,335 US per acre compared to $1,665 for mangroves. But calculating in the indirect value of mangroves dramatically reversed these figures. When they assigned a monetary value to environmental services such as nurseries for fish and protection from erosion and storms, the value of the mangroves rose to $14,428, more than 50 percent higher than shrimp aquaculture.

## The positive tip

As university students, Pisit Charnsnoh and his wife, Ploenjai, were part of a generation of democracy activists. After graduating from Khon Khaen University, Charnsnoh got involved with rural development and urban labor rights. In 1985, the couple moved to Ploenjai's hometown in Trang Province, where they started a small organization called Yadfon Association (Yadfon means 'raindrop' in Thai), aimed at helping the coastal villages in the region. At that time, Trang Province residents were locked into a vicious cycle of increasing poverty, unraveling society, and a deteriorating ecosystem.

Yadfon members spent nearly a year in dialogue with the villagers of Ban Leam Makham, working hard to gain the community's trust. The approach was to support residents' own insights into their shared crisis. Charsnoh points out that this method was more powerful than giving the villagers lectures. "We couldn't go in as outsiders and tell them, 'This or that species is disappearing, you have to be careful,' or 'You have to protect these forests.'" Over time, and with some success with micro-credit, well-digging, and other rural development schemes, Yadfon began to earn the villagers' respect.

Through a series of meetings with Yadfon, villagers developed the idea of reviving the badly degraded mangrove forests around Ban Leam Markham and Ban Thung Dase. Because the land was under government control, Yadfon staff acted as a go-between to obtain consent from provincial authorities to create a community mangrove forest. The first of its kind in Thailand, the forest covered 95 acres of land. It later became part of a 235-acre area that combined the mangrove forest with a sea grass conservation zone.

An emerging inter-village network created a system to manage the forest. Allowing use of some areas of the forest helped to get buy-in from a community that would otherwise break rules if the whole forest were declared off-limits. They prohibited shrimp farms inside the forests, set up no-fishing areas, discouraged the use of cyanide and dyna-

mite, and banned push-nets altogether. They replanted some areas of the forest and designated others untouchable, to allow for natural regeneration. The network also began replanting the sea grass beds in the coastal waters of nearby Chao Mai village.

Their efforts paid off. There was an increase in the near-shore fish catch, and a species of fish thought to have disappeared returned. These early results boosted the villagers' commitment and motivated them to further action. An endangered dugong spotted in the waters near Chao Mai village helped win government support for their seagrass protections zones; the dugong became a living symbol for conservation progress in the area.

## Cycles and tipping points

Creating community mangrove forests was an Eco Tipping Point. It tipped the local community and environment from a vicious cycle to a *virtuous* cycle, and the momentum switched from destruction to recovery.

Vicious and virtuous cycles are 'feedback loops.' These mutually reinforcing cycles of cause and effect are the heart of Eco Tipping Points. In the negative tip, as mangroves were cleared, fisheries began to decline. As fish stocks fell, fishers worked harder to get them, causing stocks to fall ever faster. In this way, they were locked into a vicious cycle of declining resources and an accelerating race to get what little remained.

After the positive tip, the fishery began to restore itself. In a study of 500 families between 1991 and 1994, total catch rose by 40 percent. Fishers spent three to four fewer hours per week on the water, while their net incomes increased by 200 percent. They could return with full boats without using dynamite or pushnets. In this virtuous cycle, less pressure from fishers allowed fish stocks to recover faster, making the fishers' jobs even easier.

The revival of the fishery spawned other virtuous cycles. Better incomes meant there was less need to migrate from villages. Instead of being locked into depletion, villagers were now locked into conservation, as the financial incentive to preserve mangroves now outweighed the incentive to destroy them.

Most importantly, investing in their future motivated the people to fight for it. A sense of ownership gave them the grit and confidence to confront encroaching trawlers and to lobby the government to enforce the two-mile no-fishing zone. It also made them less likely to sell off their land, which often ended up being converted to resort development. Reviving the forests also helped to put zoning limits on shrimp ponds. Charnsnoh explains that while many of their villages have shrimp ponds, they have kept the ponds outside the boundaries of the forests.

While the community mangrove forests started small, the virtuous cycles rippled out over time. Today, these districts include 10 community forests and four sea grass and dugong conservation areas totaling 50 square miles. Meanwhile, Yadfon has extended its involvement to some 60 villages in the three districts. Through a growing network of grassroots organizations, Charnsoh is involved with influencing policy at the national and international levels, lobbying for stronger legal standing for the forests, and gathering support to stop the practice of intensive shrimp farming. Meanwhile, Ploenjai is connecting with villages further inland, discovering new links between inland and ▶

*Humboldt County, California decided to treat wastewater as a resource rather than a problem, and built the Arcata Marsh and Wildlife Sanctuary. The marsh relies on natural systems to filter the city's sewage.*

coastal regions. "I was working with the fisherfolk since the beginning," she explains, "and have moved up [the watershed]. Now we work with the whole ecosystem."

## Treating wastewater with wetlands

Across the Pacific Ocean, a small university town nestled in the northern California coastal redwoods may seem worlds away from a fishing village of southern Thailand. But Arcata's pioneering wetland and wildlife sanctuary reveals a similar underlying story: tipping a coastal ecosystem from a vicious cycle into a virtuous one.

Home to Humboldt State University, Arcata is a vibrant little community some 280 miles north of San Francisco. Historic charm is visible in the thriving downtown, and green space abounds with the community forest and wetland areas framing the vista of Humboldt Bay. Arcata's Eco Tipping Point arrived when the community faced a sewage treatment crisis. Until the early 1950s the city discharged unchlorinated primary effluent into Humboldt Bay. Secondary treatment and chlorination were not added until the early 1970s. In 1974, federal water quality standards were revised, and state and regional authorities began cracking down.

The community faced a thorny dilemma: Buy into a proposed $25-million regional sewage processing plant to discharge treated, up-to-standard wastewater into Humboldt Bay – or devise a more environmentally acceptable alternative. The former would be a costly undertaking for a community whose population at the time was just 12,600. Also, the sewer pipeline was a potential nightmare, since ruptures under the bay could make the pollution worse.

Most importantly, the regional plant would have unleashed a vicious cycle of runaway sprawl. By laying the pipeline along the undeveloped land between Arcata and its neighbors, Arcatans believed developers would soon follow with strip malls, big-box retail zones, and subdivisions. More development would have affected the thriving downtown and locked residents into car-dependency. The sewage plant itself, along with the roads and infrastructure needed to support the development, would have demanded an unprecedented outlay from municipal coffers and taxpayers' wallets.

## The problem is the solution

The idea to treat the wastewater as a resource rather than a problem first came from Humboldt State University fisheries professor George Allen. In 1969, he had begun testing whether Pacific salmon and cutthroat trout could be raised in ponds of seawater and partially treated wastewater. Bob Gearhart, another Humboldt State University professor, expanded on Allen's idea. Why not use a marsh to treat municipal sewage more easily, more sustainably, and more economically? "The whole issue is the ownership of the wastewater – what you have control over," explains Gearhart. "It's not about disposal – it's a resource issue."

After a protracted and divisive political and legal battle known locally as 'The Wastewater Wars,' regional authorities reluctantly allowed the city to create a small version as a pilot project. If it was successful, the community would be free to expand to a fully functioning system.

The chosen site was a derelict brownfield that included a sealed landfill, two defunct logging mills, and a log pond. Creating the marsh first meant breaking up concrete where the lumber had once been stacked and stored on the old lumberyard site. National Guard engineers blew it up and carted it off. Next, a bulldozer terra-formed the ground, creating a micro-terrain similar to that of a wetland. Volunteers from the community planted several kinds of native marsh plants in order to have alternating areas of open water and vegetation. They took care to plant more densely in the farther reaches of the marsh in order to fully remove any solids that remained in the water. In 1986, the treatment system was completed and became operational.

Today, the Arcata Marsh and Wildlife Sanctuary covers 154 acres of freshwater and saltwater marshes, tidal mudflats, and grasslands. Wastewater is piped from homes and buildings to the 'headworks,' where debris is removed and solids settle. The solids are sent to digesters for use as compost on the town's community forest. The sewage is sent to oxidation ponds before entering a series of treatment and enhancement marshes. Naturally occurring processes progressively purify the water, then two rounds of chlorination bring it up to state standards before its release into Humboldt Bay.

When Eco Tipping Points launch virtuous cycles, they employ nature's own processes to do most of the work. Instead of a multi-million dollar treatment plant, Arcata has used the "free" services of a wetland to purify its wastewater. Roots and stems of wetland plants form a dense, netlike filter that removes suspended solids. Plants and algae remove nutrients such as nitrogen and phosphorus, while bacteria and fungi decompose the solids and remove dissolved organic material. Bulrushes provide a canopy of shade, controlling the growth of algae, and helping to slow water flow so the microorganisms can do their job.

Plants and microorganisms pass organic material up the food web to small aquatic animals and insects, and ultimately to top predators such as hawks, foxes, and otters that have come to symbolize the wildness of Arcata's wetland. As plants, animals, and microorganisms break down organic material to extract energy, the residue passes out of the wetland ecosystem and into

the atmosphere as carbon dioxide and water. Meanwhile, larger animals, birds, and flying insects move out of the wetland, carrying organic material and nutrients and distributing them around the surrounding countryside. They also bring in seeds from other areas, promoting and supporting biodiversity. The end result is a wetland and wildlife sanctuary that supports 300 species of birds and mammals, 100 species of plants, and six species of fish.

As the wetland regenerated nature's systems, it spun off virtuous cycles for humans as well. Arcata's wastewater and derelict brownfield became economically and socially valuable. 'Recycling' gave Arcatans access to their formerly blocked-off waterfront. They gained a community space for leisure and recreation that draws as many as 150,000 visitors a year. Walking through a pathway surrounded by the songs of thrushes hidden in dense foliage, it is hard to imagine that the wetlands are actually working to break down household sewage. By creating a physical barrier to development, the wetland became a *de facto* 'zoning restriction' that was more effective than any government regulation. Students at Humboldt State University gained a research site. In the process, they provided a level of technical support, data collection, and monitoring that the town could not have afforded on its own.

More critically, choosing this unorthodox path set Arcata apart from its more conventional neighbors and fed the city's sense of pride. The marsh became a shared symbol that has helped to shape local identity. The community's motto today is "Flush With Pride."

"I think the marsh has become symbolic of [the idea] that we can do things our way," says Julie Fulkerson, a former Arcata mayor and councilor. "Thinking of this community without the marsh is very depressing. For one thing, if the massive [treatment] system had been built, it would have cost millions of dollars, and we'd be paying for it. And with a pipeline between Eureka and Arcata, I just can't imagine why there would not have been development in that entire strip. It would have looked like any other blended community in California."

## Common ground

In spite of their obvious differences, a deeper look at both Arcata and Trang Province reveals Eco Tipping Points at the source of each community's revival. Both communities had found leverage points in the vicious cycles where targeted actions could reverse them. Feedback loops that created and reinforced environmental degradation were replaced by feedback loops that rescued the ecosystems. By allowing mangroves to regenerate, and by designing a system that could treat waste with very little external manipulation, the communities let nature do the work of restoring their shared resources. The cohesion that emerged as a result gave them the impetus to rise to new challenges.

Despite their successes, these communities are not utopias. Both are on steep learning curves towards sustainability, and new challenges emerge as old ones are tackled. But they show how human and natural systems can tip together out of decline and towards greater health and sustainability. They show that local citizens can devise their own environmental solutions, without elaborate government regulations or high-cost technologies. Sharing the stories of these Eco Tipping Points can demonstrate that achievements often considered unrealistic, costly, or otherwise unfeasible are not just desirable alternatives. They are practical ones. ✹

**The city of Arcata, California was faced with a dilemma: Buy into an expensive regional sewage processing plant to bring their wastewater discharge into Humboldt Bay up to water quality standards, or come up with an acceptable alternative. They embarked on a pioneering journey, using wastewater to create and nourish a wetland where a logging pond and city dump had once been. The wetland provides prime wildlife habitat and recreation for the community at the same time it purifies the water.**

## Introduction

The people of Arcata, California, did not think of their sewage as a resource. In fact, like most of us, they did not think about their sewage much at all. But in 1974 they entered a period referred to as the "Wastewater Wars" when the need to reassess that view and assert their community's control of this "valuable" resource became essential.

Arcata is a small city located on Humboldt Bay, in the coastal redwood country of Northern California. In 1972 new federal legislation required that the water quality of the Bay be improved. Eureka, a larger city 5 miles south was often dumping raw sewage in to the bay, and Arcata's wastewater treatment plant was not adequately treating their wastewater. The State and regional government proposed a new

wastewater treatment plant that would serve this small university town and the other areas on the bay. This would be a very expensive undertaking for Arcata, population 12,600. Also, the sewer pipeline that would follow Highway 101 from McKinleyville on the north, through Arcata to Eureka and then out into the bay itself was a potential nightmare. Ruptures under the bay could make the pollution worse. And it would provide the infrastructure to open up the surrounding area to development.

Arcatans valued the unique character of their university town and their semi-rural setting. They had no desire to be engulfed by strip malls and housing developments. The regional wastewater treatment facility proposal was an engineer's and developer's dream. Turning that dream into their own is a story about taking charge of a local resource and tipping it from planned unsustainability to a sustainable, productive force in their community. The outcome was the Arcata Marsh and Wildlife Sanctuary (AMWF), 154 acres of freshwater and saltwater marshes, tidal mudflats and grasslands. It treats and disposes of the city's sewage while providing a wonderful natural recreational area, and has become an inspiration for other communities throughout the world.

In 1974, before this began, the area where the Arcata Marsh Interpretive Center (AMIC) now stands was surrounded by a derelict lumber mill with a log-filled marsh, cracking concrete and an unkempt landfill, affectionately known as Mt. Trashmore.

Arcata had recently fought a battle to prevent a new federal freeway from bisecting their town and developing the surrounding agricultural lands. Earlier on they had stopped the clear cutting of an adjoining redwood forest, turning it into a community park with hiking trails. It was the first community managed and owned forest in the country. Arcata also boasted the first recycling program in the country.

Despite their history of local environmental activism, taking on the State of California and the Feds was daunting. But there were things about Arcata that made it possible—though it didn't always seem that way in the midst of the fray. Arcata is the home of Humboldt State University, a campus known for its strong environmental programs. The more conservative surrounding areas see it as home to "kooks, tree huggers and flakes." Even within Arcata the town-gown split has traditionally mirrored this difference. However, a change in the federal electoral law had recently allowed 18 year olds to vote and the students and young residents used their new found voice to elect a new city council, one that campaigned on protecting the environment and near-by agricultural land. The university also contributed a faculty with incredible expertise and a willingness to share it.

Ironically, the shoreline of Humboldt Bay had not been accessible to the town for many years as it was blocked by the old saw mill, the landfill and the existing sewage treatment plant. Now it is the crown jewel of Arcata, used daily for recreation, birding and gazing by locals and tourists alike.

Committed and courageous leadership is essential to carry a campaign like this through to the end. The Arcata story had many. A trip around the marsh sanctuary introduces some of these leaders.

There is the George Allen Marsh on what was once an abandoned concrete log deck. In 1969 Dr. Allen, a professor of fisheries science at the university, had begun an experimental project intended to find out if Pacific Salmon and cutthroat trout could be raised in ponds with a mixture of partially treated wastewater and seawater. This project was the first to question the conventional paradigm of waste, accustoming Arcatan's to more elastic thinking about wastewater. In fact, the initial alternative proposal to the regional treatment plant was to use aquaculture based on some of Dr. Allen's ideas. Though this changed, he remained an important part of the development of the marsh.

Then we come to the Robert Gearheart Marsh, formerly minimally used pastureland. Dr. Gearheart was a professor of environmental engineering at the university. He always saw himself as a biologist first, and an engineer second. Like many of the important leaders in this project, he was willing to take a calculated risk —some would say a huge gamble. What they tried to do had never been done. He knew there was no guarantee his idea of a marsh would work. However, he was a careful scientist and an excellent communicator. His dedication to the vision of the marsh as way for the community to maintain control of its resources and uniqueness kept the torch alive. He feels that one of Arcata's strongest arguments was that "they were putting back into service 30-40 acres of unused wetland—basically ugly, industrial brownfields that nobody wanted."

Further on is Dan Hauser Marsh, the first marsh to be treated with wastewater. Dan served on the city council and as mayor from 1974—1982, and then spent 5 years as city manager. He felt the marsh grew out of political and land use issues rather than wastewater treatment. "When Bob Gearheart started explaining what a marsh could do and we began reading stories about what the marsh used to be like," Dan says, "I fell in love with the idea of marshes."

"The regional wastewater project was a good idea in theory, but it just didn't fit Arcata," according to Hauser. The proposed pipeline would increase pressure to develop the adjacent agricultural land. In fact, in 1974 one of Dan and the new city

council's first acts had been to deny water for development of a newly annexed area pushed through by the old guard. This effectively stopped the project.

Hauser and the council estimated that "The wastewater treatment plant and pipeline would have been the largest energy consumer in the county, costing a bundle to run." Even the environmental community was not wholly behind the marsh idea. David Joseph, an environmentalist, was the head of the North Coast Regional Water Quality Control Board (RWQCB), the body that was in charge of the proposed regional treatment plant. He was concerned that the city was trying "to get out of something." Also, at that time Eureka, the larger city down the road, was discharging raw sewage into the bay. He was afraid if the project didn't go through this wouldn't stop.

Continuing around the Marsh, Franklin Klopp Lake comes into view. Frank had been a city engineer since 1968, graduating to Director of Public Works. He was an "old guard" engineer and says he didn't object to the new treatment plant until he got to the last 4 pages of the report and saw the cost. It would mean doubling the sewer rates just to get it going. He had just pushed through a doubling of the rates and had taken quite a bruising. He was not anxious to repeat that. He started listening much more carefully to Bob Gearheart. But he needed to see an actual working example. Words were not enough. They went on a visit to Mountain View, a town on the peninsula south of San Francisco. There they saw "a simulated marsh made up in part of beer cans filled with foam and wood chips processing sewage." He figured with Arcata's resources it could work even better. He also gambled that the costs of developing the marsh for sewage treatment would be less than the regional plant. He figured it would have cost Arcata $10 million for their share of the construction of the regional system as opposed to the $5 million they spent. And the annual maintenance cost is about $500,000 instead of $1.5 million.

Today the marsh not only treats all of Arcata City's municipal sewage and wastewater, it also supports approximately 100 species of plants, 6 species of fish, and a multitude of bird and mammal species that have populated it naturally from the surrounding region, including otters. The marsh lies on the Pacific Flyway, which is the permanent or temporary home to over 200 species of birds. The Aleutian Goose, for example, takes off from the tip of the Aleutian Islands, flies across the Gulf of Alaska, and makes landfall in Humboldt County.

And most important, more than 200,000 people a year get to enjoy the marsh for recreation, birding, or scientific study, and the whole area now has access to the bay. The community support organization, Friends of Arcata Marsh, hosts regular birding tours. Moreover, since 1996 Arcata has hosted the annual 3-day Godwit Days festival, a birding event held at the peak of the spring migration, which

features field trips, boating excursions, lectures and other community activities for birders.

The vicissitudes of the political battle that led to the marsh are complex. It came down to the pro-marsh forces being able to prove that the marsh would "enhance" the water quality of the bay, meeting a key legal requirement. We will leave most of the politics aside for now and focus on the marsh itself.

---

## The Setting and Its History

Arcata city, population 16,651, lies on the north-east shore of Humboldt Bay, 280 miles north of San Francisco. It was established in 1850 as a supply port during the gold rush era that precipitated the timber boom which was to follow. Arcata rests in the heart of Northern California's "redwood county" and is home to Humboldt State University. In 1970, the population was 8,985, and it has risen to 12,850 in 1980 and to 15,197 in 1990. Today it has about 16,381. About half of Arcata's residents are students at Humboldt State University, and the overwhelming majority of the population (81.3 %) is Caucasian. It is a progressive town in an otherwise conservative region. The decline of the logging and fishing industries has caused the regional economy to flounder economically over the past three decades. Where Arcatans see an unspoiled landscape, small cottage industries and extensive community involvement as ongoing goals, others in the region would like to see industries that bring jobs, convenient shopping and affordable housing so they can stay there.

People have inhabited the region of Humboldt Bay for thousands of years. The indigenous Yurok and Wiyot people settled here because of its abundant resources and easy access to transportation. In those days, the Bay was surrounded by salt marshes, freshwater swampy meadows, and forest. Despite the Wiyot peoples' presence, the landscape remained relatively unchanged over centuries.

From 1849, however, European explorers arrived and began to settle in the area. The settlers forcibly displaced and sometimes massacred the indigenous communities, so that by 1860 the native population was down to less than 5% of its pre-Europe population. From 1870 the settlers began draining the marshes for agriculture, and built a wharf and California's first railroad track. The railroad linked dry land and a shipping channel built further out into the Bay that remained functional until the 1920s.

In 1945, two lumber mills operated in the area (one where the Interpretive Center is now located and the other where Allen Marsh is located). There was a log deck for

storing lumber. Butcher's Slough was elongated to make a channel for the mills, and a nine-acre log pond was built. The mills closed down in the late 1960's as the region's logging economy began to implode. The mills' condition further deteriorated over the years as a result of fires and neglect.

In 1964, the area that is now nicknamed "Mount Trashmore" was drained and diked in order to create a 40-acre landfill. Within a decade of the landfill starting operation, the ecosystem deteriorated as the overpopulation of cats and gulls began unraveling the food web, and leachate from the landfill contaminated the Bay. In 1973 the landfill was condemned, shut down, and sealed using mud from the Bay. This raised the question of what to do with the closed landfill,. Suggestions floated included a marina, motor cross area, golf course, baseball field and nature center/marsh restoration area. The City of Arcata finally decided to restore the area to a wetland. This coincided with the time that the federal and State government began strictly regulating wastewater.

---

## The History of Wastewater Treatment in Arcata

Arcata's former wastewater treatment plant was constructed in the 1940s, when the town's first sewers were installed. There was only primary treatment of the wastewater, with no chlorination, before it was discharged into the bay. It did not reduce Biological Oxygen Demand (BOD) or remove suspended solids and possible pathogens. Biological Oxygen Demand, a key standard for measuring treated wastewater, is the measure of oxygen required to break down organic materials in water. With untreated (or improperly treated) sewage high organic loads may reduce the amount of oxygen available to sustain fish or other aquatic life.

Fifty-five acres of oxidation ponds were added to the facility in 1958, which raised the level of treatment to secondary standards, followed by chlorination facilities in 1968. De-chlorination facilities were added in 1975. At this time, the State of California was getting tougher on municipalities' wastewater management policies in response to the Federal Water Pollution Control Act Amendments of 1972, the predecessor of the Clean Water Act.

In April of 1974, the California State Water Resources Control Board (SWRCB) adopted a Comprehensive Basin Plan for the North Coast Region. In a nutshell, the policy regarding discharges into the Bay was that it be "phased out at the earliest practicable date." However, the Regional Water Quality Control Board could grant exceptions if the discharging municipality could prove that "the wastewater in question would consistently be treated and discharged in such a manner that it would enhance the quality of receiving waters above that which would occur in the

absence of the discharge." This meant that a municipality would somehow have to prove that the wastewater, if discharged into the Bay, would enhance the water quality in the Bay. It was assumed that this would only be feasible if all the municipalities along the bay pooled resources to build a regional treatment plant. No single municipality was large enough to afford a treatment system advanced enough to satisfy these federal regulations.

In response to this plan, a “Joint Powers Agency” was created in 1973 to resolve the issue. The Agency consisted of the municipalities of Eureka, Arcata and McKinleyville in Humboldt County. An engineering firm, Metcalf & Eddy, developed a design for a regional facility that would serve these communities. The facility would be located on the Samoa Peninsula and was estimated to cost $25 million. In 1974, the Humboldt Bay Wastewater Authority (HBWA) was formed. It included the Joint Powers Agency and the McKinleyville and Humboldt Community Services Districts, and was charged with the responsibility of constructing the regional wastewater treatment plant.

The proposed plant would have large interceptors around the perimeter of the bay, with a major line crossing under the water in the region of active navigation. Effluent from the plant would be released offshore into an area of shifting sea bottom and heavy seas during winter storms. The facility would have been capital- and energy-intensive, and no one agency could afford it, so sharing expenses was believed to be the only solution to solving the Bay communities’ collective wastewater problems. However, as plans progressed, the logistical challenges of incorporating all communities as well as the costs--economic, social and ecological--became increasingly apparent. The plan became a hot political issue. A major concern, especially in Arcata, was that the creation of a sewer interceptor line running from McKinleyville to Eureka along Highway 101 would open up agricultural areas to suburban-style sprawl. The resulting strip malls and subdivisions would render the communities indistinct from one another and eliminate the rural character of the area. Another concern was that some of Arcata’s investments, both in the aquaculture project, and in the existing treatment plant, would be lost. For two years, the City Council tried to convince the Regional Water Quality Control Board (RWQCB) and HBWA that there had to be other alternatives to the regional treatment plant.

From the time the Comprehensive Plan was created, Arcata descended into a politically volatile period sometimes referred to as the "wastewater wars." The main factions split along two lines. The supporters were the development and financial interests, the engineering community consisting of the RWQCB as well as State officials, the bulk of Arcata’s "old-timers," and environmentalists who feared that if

Arcata opted out of the plan, HBWA would collapse and neighboring Eureka would continue to discharge its partially untreated effluent into the Bay. Supporters of the marsh were led by City Councillor Dan Hauser, Humboldt State University environmental engineering professor Bob Gearheart, then-Public Works director Frank Klopp, and Humboldt State University fisheries professor George Allen. Arcata citizens against the project tended to be environmentalists, professors and students, and newcomers who were fleeing other built-up areas further south, all of whom valued Arcata's natural beauty and historic rural charm.

In 1975, critics of the regional plan formed a coalition called "Citizens for a Sewer Referendum." They launched a campaign to call for a vote on the project. Their persistence paid off in eventually helping to stall the project. However, it became increasingly clear that if Arcata were to opt out of the plan it would effectively block the regional treatment plant. Other communities in HBWA could not afford to go forward without Arcata. Part of the antagonism towards the Arcata critics of the plan was that as time went on, inflation was rapidly increasing the cost of the project.

At this point, Arcata had to come up with an alternative plan that would not only assure treatment of the sewage, but that would satisfy the "enhancement" requirement in the Comprehensive Basin Plan. The idea to build its own wastewater treatment plant came about in 1976 amidst this divisive controversy. The City began exploring the design of a decentralized system which made use of constructed wetlands. The idea had its origins in the aquaculture work of Dr. George Allen. In 1969, Dr. Allen had begun an experimental project intended to find out if Pacific Salmon and cutthroat trout could be raised in ponds with a mixture of seawater and partially treated wastewater. This type of project challenged the conventional paradigm of waste in two ways. First, it said waste was a valuable resource rather than a harmful, expensive nuisance that had to be disposed of. It also declared that communities themselves—rather than centralized bureaucratic regulatory bodies—could manage this resource if given the freedom to do so. The idea of creating and using a marsh began to grow in the mind of Robert Gearheart, another Humboldt State University professor. Using the fish aquaculture project and a treatment marsh as probable ways to prove "enhancement," a city task force proposed that the natural processes of a wetland could be harnessed to effectively and efficiently treat municipal wastewater. This was a huge departure from business as usual.

In 1977, the City of Arcata team, consisting of George Allen, Bob Gearheart, Public Works director Frank Klopp and City Councillor Dan Hauser put their proposal to the Regional Water Quality Control Board. They would have a wastewater treatment process that used the existing primary sedimentation facilities, a 22.3 hectare oxidation pond facility, and three new constructed marshes. The effluent from the

marsh system would then flow through a 6.9 hectare lake before being discharged into the Bay. The city insisted that this system would not only protect all of the existing beneficial uses of the Bay, but would enrich them and even create new ones such as greater bird habitat and extensive recreational space. They presented this plan at RWQCB meetings and before the SWRCB, as well as to the citizens of Arcata itself. There was much quibbling over whether or not this was the type of enhancement outlined in the regulations. They challenged the Chair of the SWRCB to define exactly what was meant by enhancement. When he could not do it, the marsh supporters were able to prove that 'enhancement' of the Bay' was a meaningless term and legislation was introduced to eliminate this requirement.

Meanwhile, the Coastal Conservancy, a California non-profit organization became involved. The Coastal Conservancy purchases critical coastal habitat and conservation easements and works with communities to restore coastal land. They had been observing the events in Arcata and offered to help fund the wetlands restoration that was part of the three original marshes.

The University and the city formed the Task Force on Wastewater Treatment that created the pilot project Arcata was finally granted permission to undertake. The State Water Resources Control Board funded the 3-year study which began in September of 1979. It experimented with partially treated wastewater and the natural processes of wetland ecosystems. The results of the pilot project promisingly showed that not only could the constructed wetlands effectively treat wastewater, but that it would also enhance the biological productivity of the wetland environment into which wastewater was discharged. At the end of the pilot project in 1983, the Board agreed that the marsh system would indeed "enhance" the beneficial uses of the Bay for scenic enjoyment and educational study, and that a full-scale marsh system would satisfy the requirements of the Basin Plan. As the Task Force's original leaders emphasized, the plan was a simple, cost-effective application of an appropriate technology.

With the help of the Arcata City Council and political representatives in Sacramento, in 1983 the city received the go-ahead to develop the marsh.

---

## Constructing the Marsh

Sections of Arcata's old industrial sites by the shore of the bay had concrete where the lumber had been stacked and stored. To create the marshes, they had to break up the concrete. This was done as an activity with the National Guard combat engineers. They came in one Sunday, blew the concrete up, and carried it off. A lot of other residue from the saw mills also had to be taken out.

The section that is now Gearheart Marsh was originally pasture land. Because the terrain was slightly lower than the surrounding area, it had relatively large areas of open water once the water was let in. Marsh plants were allowed to grow in naturally.

When the landfill was closed, a dike was set up around the Bay. Sediment was scooped out and put on top of the landfill to seal it. The current wetlands surround the landfill, but none are on top of it. The landfill has been monitored for seepages of any kind and so far no contaminants have been found to have leached out of it.

The last marsh was "terraformed" to be various depths, deeper in some places, shallower in others. Moving the dirt around to create this "micro-terrain" was done by bulldozer. Differing depths was necessary because if it was kept shallow, the tubers of the sago pondweed would spread everywhere uniformly and undermine the biodiversity needed for the marsh to do its work. Flow in the marsh is faster at the edges of groups of aquatic plants than in the middle.

Vegetation was added to about one third of the last marsh, Hauser Marsh, to provide denser vegetation towards the end of the system. This ensures that the marsh will strip out any remaining solids in the effluent. They used native Hardstem bulrush brought in from a near by fishing lake. This marsh has alternating areas of open water and vegetation. Everyone said they wanted islands but they didn't work as well as planned and were removed. This was one important lesson they learned about creating a constructed wetland.

Sago pondweed seeds were broadcast into all the deep areas of all the marshes. Ducks love to eat this seed, providing a natural harvest to keep it from taking over. The team learned a lot about planting, often by trial and error. Some of the unsuccessful methods they used included burying the whole plant by the roots and throwing sprigs of the plants into the water. Unfortunately the waterfowl would eat everything immediately. Their greatest success came when they trucked in plants, cut off their tops, but kept a substrate of some of the original soil around the tuber. Previous orders of plants had come with their original dirt stripped away and they were unable to make the transition to the marsh. It takes about two years for the soil encrusted plants to grow to maturity.

A floating plant, Hydrocotyl, can sometimes take over and excessively shade the marsh, so it is periodically harvested. It is then mixed with sludge settled out from the first stage of treatment and used as compost in the Arcata Community Forest.

In 1986, the treatment system was completed and became operational. In the same year, the Coastal Conservancy provided funds to restore Butcher's Slough which

expanded the Sanctuary to its current size. The slough was refigured into a more natural channel, thereby enlarging the saltwater wetlands, and creating another freshwater marsh in a former log pond.

In order to extend the area of the marsh further, 3.15 acres of land on the inland side of the wetland area has been acquired, and a pond has been created there. Aquaculture still continues in parts of the marsh, though the fish are not raised for commercial purposes. However, more than half of the oysters grown in California are produced in a subsection of Humboldt Bay known as Arcata Bay.

---

## The Wastewater Treatment System

All municipal sewage treatment, whether conventional or alternative, is broken down into two main phases. Primary treatment is largely a mechanical process which separates the solids from the liquids, while secondary treatment removes contaminants and pathogens harmful to humans. The AMWS's primary treatment occurs in the headworks and clarifiers, while the secondary treatment occurs at the oxidation ponds, chlorination basins, treatment marshes and enhancement marshes.

The flow between components occurs through underground tunnels. Water levels in the marsh are not intentionally changed, for example, by adjusting weir levels. Once they are set, they are left to function on their own.

1. The Headworks. This is the first phase in the treatment of raw sewage. Water is piped underground from Arcata households to the headworks. Here inorganic materials are removed from the water using two Archimedes screw pumps that lift the raw sewage fifteen feet up and pass it through bar screens and grit separators before it enters the clarifiers.
2. Primary Clarification. The water sits for about four hours in the clarifiers. Two clarifiers (26 feet and 60 feet in diameter) are used for settling out any remaining suspended material that makes it past the headworks. The liquid effluent from the clarification process is sent to the oxidation ponds. The solids that settle out from the clarification process are sent to digesters.
3. Digesters. The remaining sludge from the clarifiers is pumped to the primary and secondary digesters respectively. Anaerobic microorganisms in the digesters consume the nutrients in the sludge as their food, and produce carbon dioxide, methane and hydrogen sulphide as by-products. The digesters mix the sludge by recirculating

methane gas with compressors. The remaining sludge goes onto a sludge drying bed. It is then mixed with yard waste and hydrocotyl, the aquatic plant, and is used to fertilize the soil in the Community Forest.

4. Oxidation Ponds. These ponds cover an area of 55 acres. They were built in the late 1950's. They are approximately five feet deep, and are used for settling out smaller solids not removed by primary treatment. The effluent is channeled by underground tunnel into the oxidation ponds to treat it to secondary standards. "Secondary standards" means that at least half of the BOD (biochemical oxygen demand) and suspended solids that remain after primary treatment have been removed. Breakdown of the floating and settling organic matter in the sewage is facilitated by algae growth and microbial/bacteria activities in the ponds. Sunlight is key to this process, because algae produce oxygen through the process of photosynthesis,. Algae also consume nitrogen and phosphorus, two common nutrients found in municipal wastewater. Microbes and bacteria use oxygen produced by the algae to break down and use the nutrients in the waste for their own metabolism. The by-product of this is carbon dioxide, which is then used by the algae to produce more oxygen for the microbes. Mechanical aerators are used in the oxidation ponds as well, to aid the algae in oxygen production.

5. Treatment Marshes. The treatment marshes reduce the remaining BOD concentrations, dead algae, and other suspended solids that remain in the oxidation pond effluent. There are three treatment marshes, each of which is two acres in area. They are located north of the oxidation ponds. They were created by subdividing the original oxidation ponds. All the marshes were planted with hardstem bulrush. This helps settle out the suspended solids by slowing down the water flow and preventing growth of new algae. The wastewater circulates through a marsh system before it is combined at a pump station and flows into the disinfection facility.

6. Disinfection. There are two separate stages of disinfection. The first occurs after the effluent passes through the treatment marshes. The second takes place after passing through the enhancement marshes just before its release into Humboldt Bay. Disinfection is necessary to kill any viruses or pathogens present in the water. Technically the second chlorination is unnecessary given the effectiveness of the enhancement marshes, but is required by regulators in order to conform to fecal coliform standards. Ironically, the standards are 'violated' only because birds are discharging excrement into the enhancement marshes. Because of the double chlorination, two

chlorine contact basins are necessary. The basins are located immediately south of the headworks. Any free chlorine remaining in the final effluent after the 60 minute contact time is removed with sulphur dioxide. After the second chlorination, depending on how much water is coming into the marsh, it is either released into the Bay or sent to the enhancement marshes. Usually it is mixed with water from the enhancement marshes and released into the Bay.

7. Enhancement Marshes. After the first chlorination process, the effluent flows into the enhancement marshes located northwest of the oxidation ponds. The three marshes, each named after George Allen, Bob Gearheart, and Dan Hauser respectively, cover a total of 31 acres. The flow is controlled through the use of sluice gates and weirs, though the water flow is rarely interfered with. The natural processes occurring in the marshes simultaneously purify the wastewater by removing excess nutrients and 'feed' the marsh plants with water high in nitrogen-rich organic matter. Nutrients are taken up by the plants and thus removed from the wastewater. The roots and stems of the plants also clean the water by forming a dense netlike filter that removes large quantities of suspended solids. Algae, fungi, bacteria and micro-organisms attached to the roots of these plants feed on these solids. This nutrient-rich habitat attracts many birds to the sanctuary. It has become an exceptional and cherished place for birders, recreation, research and education. Before discharge into Humboldt Bay, the water returns to the disinfection facility for a second chlorination. In total, all wastewater that enters the system spends about fifty days there from its first contact with the headworks to its release into Humboldt Bay.

---

## Marsh Specifications

- Design Population: 19,056
- Average Annual Flow: 2.3 million gallons/day (mgd)
- Maximum Monthly Flow: 5.9 mgd
- Peak Flow: 16.5 mgd
- BOD's Load: 4100 lbs/day
- TSS Load: 3400 lbs/day

---

## The Arcata Marsh Interpretive Center

All the work and ingenuity that went into the marsh was rewarded in 1987 when Arcata received the Innovations in Government Award from the Ford Foundation/Harvard University Kennedy School of Government and $100,000 to begin building the Arcata Marsh Interpretive Center. Open to the public since 1993, the Interpretive Center has exhibits on the political, ecological and technical aspects of the marsh. It is staffed by city employees on weekdays and by community volunteers on weekends and holidays. The Friends of the Arcata Marsh offers free educational tours of the AMWS and treatment facility.

---

## Spin-Offs

Creation of the marsh allowed not only reuse of wastewater but also ecological restoration of industrial, agricultural, and public service land:

- "Zoning." An important aspect of the case was that it not only prevented development in the agricultural areas between the communities, but it also restored a degraded waterfront area. Before the marsh, the land consisted of an abandoned lumbermill pond, channelized sloughs, low-quality pasture land, and a sealed landfill.
- A window to Humboldt Bay. Before the marsh was created, Arcata citizens had no access to its waterfront. After the AMWS, the entire area was opened up. As the disused landfill, "Mount Trashmore," was on higher ground, it now allows people a broad view of the Bay.
- Habitat creation. Some 60,000 acres of wetland are lost annually, mainly to draining and reclamation for development and agriculture. Of the remaining 100 million acres, many are severely degraded. Creating the Arcata wetlands not only provided a cost-effective, low-energy, low-maintenance essential service, it also locally reversed the trend of wetland loss.
- Green city. Arcata City Hall is environmentally active and maintains various other programs including a greenhouse gas reduction plan, solid waste reduction, Open Spaces initiative, pesticide reduction plan, pedestrian/bicycle plan, and community forest.

---

## The Community Forest

Arcata's Community Forest is comprised of approximately 622 acres of 120+ year old redwood forest obtained in several purchases financed by bond measures over a

50 year period. This acquisition process culminated in the dedication of the Community Forest in 1955.

The forestland was used as a source for the municipal water supply until 1964. Since then it has served many functions including recreation, education, sustainable timber harvesting, and wildlife habitat. It is also an outdoor laboratory for students and 'citizen scientists'. The forest serves as the headwaters of many of Arcata's urban streams. The main tree species is California Redwood but Douglas Fir, Grand Fir, Western Hemlock and Sitka are also present.

In 1979, a "Forest Management and Parkland Initiative" ballot measure was passed by Arcatans. Its intent was to create a long-term management program governed by 'ecological principles' that would preserve its recreational uses as well as generate revenue for further forest acquisition by carefully harvesting the forest's timber. This was the nation's first forest to be certified by the Forest Stewardship Council (FSC) as eligible for the "Smartwood" designation which denotes sustainably harvested wood.

Annual revenue generated by the forest is $500,000-700,000 per year. Trees are generally harvested every other year. Revenues from the sale of timber go into acquisition of land through outright purchase or by granting conservation "easements," where land owners are paid a fee to sustainably manage a given parcel of land. The focus is on areas contiguous to the forest or otherwise ecologically sensitive habitat. Land acquisition is contingent upon funding, mostly from grants.

---

## Conditions Contributing to Arcata's Success

1. Public Works Director Frank Klopp was an "old paradigm engineer" who subscribed to the belief that wastewater had to be disposed of and not utilized, typically through command-and-control and technology. He initially supported the regional wastewater treatment pipeline plan until he saw the cost to Arcata. He realized Arcata would never be able to afford it. This led him to seriously consider the merits of the 'other side's' plans. Through discussions with the marsh's main proponents and after witnessing a similar project in the San Francisco Bay area, he 'converted'. He then became a key figure in enlisting buy-in from engineers in the HBWA, SWRCB, and RWQCB as well as the more conservative members of the community in a way that someone outside his profession could not.
2. There was a reduction in the national voting age in 1971 from 21 years of age to 18. This new political clout among younger people had

particular impact in a university town like Arcata.

3. The change in political climate helped facilitate the "changing of the old political guard," which brought in a new generation of politically progressive leadership in City Hall.
4. The city displayed a high level of creativity in finding alternatives to the 'bust' that characterized the region's extraction-based fishing-forestry economy (possibly due to #2 and #3) (see Julie Fulkerson's and Dan Hauser's comments below).
5. The Marsh and the Community Forest became de facto 'zoning' initiatives because development could not occur there. This was more effective than any regulation, as the community forest and wetland became physical barriers to development, impregnable to the power or political machinations of the development crowd.
6. While initial concern over the pipeline was that it would allow development between Arcata and neighboring Eureka and McKinleyville, this bled into other concerns such as the mounting costs and potential liability issues if the pipelines under the Bay were to malfunction or rupture.
7. The presence of Humboldt State University meant access to cost-effective, often free, technical support, data collection, monitoring and research that continues to this day. This level of scientific and technical knowledge would not have been otherwise affordable to Arcata. Humboldt State is unique in that it has the only program known as "environmental resources engineering," which integrates fields which have normally been fragmented. It integrates biology, chemistry, physics and ecology. Partly as a result of Bob Gearheart's involvement with the marsh this program was redesigned so that engineering students, in their formative undergraduate years, get a more comprehensive outlook on the world (see Bob Gearheart's comments).

---

## Environmental Tipping Point Elements

1. Positive feedback. The trend in North America towards development that opens up formerly agricultural or virgin land was partially halted by the marsh in two ways: **i)** The Regional plan with its pipeline following Highway 101 would have provided the infrastructure for easy development of the agricultural land between McKinleyville and Eureka. Creating the marsh prevented the "freeing up" of this land. **ii)**

Creating the marsh efficiently reused disused land which had fallen onto the City because no one wanted it, rather than using new land which would have set in motion the feedback loops in i).

2. "Nature Doing the Work." Wetlands are well-known biological filters and perform critical cycling, filtering, purifying, water storage and flood prevention services for free. Using a wetland to treat waste simply takes advantage of natural biological processes occurring in wetlands. The main function of wetlands in wastewater treatment is the uptake or removal of nitrate, ammonium, phosphate, and possibly heavy metals.

---

### A Few of Many Examples of Nature "Doing the Work" in the Marsh:

· The structure of a wetland itself, with its slow flow and shallow depths allow sediments to settle as water passes through it. Also, the slow flow allows long contact times between the water and the surfaces in the wetland, allowing for crucial exchanges to happen at the microbial level.

· Two processes are of particular importance for nitrogen cycling:

1) Dentrification: The conversion of nitrates found in wastewater by bacteria into nitrogen gas through removal of oxygen in the anoxic conditions found in the detrital layers of the wetland.

2) Nitrification: The conversion of ammonium to nitrates (which must happen in oxygen rich regions of the soil, usually near the clumps of vegetation) which can then be converted into nitrogen gas through dentrification.

· Plants, primarily bulrushes, provide a "canopy" of shade over the water which inhibits algae growth, cools the water, slows down its flow, blocks UV rays, reduces the level of evaporation and helps to oxygenate the water through the process of photosynthesis. It also provides the habitat for microorganisms such as beneficial bacteria, on the roots of these plants. These bacteria are beneficial because they consume the suspended solid particles. Floating plants that block light are generally harvested by aquatic birds (although, as stated earlier, periodically they must be harvested if excessive). These floating plants also reduce the level of evaporation.

· The layer of litter on the soil surface of a wetland is known as the "detrital layer." It is in a generally constant state of slow decomposition by bacteria and other organisms. Generally wetlands have ample detritus because the anaerobic conditions in the wetland slow down decomposition. It offers surface area for decomposers such as fungi and bacteria that nitrify and dentrify (see above).

Acinomycetes is one particularly active microorganism that helps to cycle nutrients. Sediments in the oxygen-poor detrital layer also provide conditions for breaking down complex organics (i.e. greases, fats, solvents, fuels). As well, they sequester metals and provide a source of carbon, nitrogen and phosphorus to drive microbial processes.

· Sunlight, through the process of photosynthesis, produces oxygen needed to facilitate the processing of nutrients in the wastewater by microorganisms.

· Single and multi-celled organisms reduce the carbon and organic material and "pass it up the food chain" in the form of insects and birds which then fly away and carry it out of the wetland. Birds also bring in seeds from other areas which foster biodiversity and ensure continued growth of flora.

· Insect larvae and other insects such as beetles consume the solids which settle out of the partially treated wastewater.

3. "Success Breeding Success." The success and popularity of the marsh gave those in City Hall the freedom to imagine more possibilities for the marsh and other projects. It also has created a stronger base for support of environmentally friendly projects in the town.

4. Replication: Arcata's story has become a landmark in alternative wastewater treatment. It has attracted interest and visitors nationally and internationally. Bob Gearheart and other key players have traveled to various parts of the world to promote and provide technical support to other communities interested in adopting similar models. They have visited Oaxaca in Mexico, the West Bank, Egypt, Thailand, Indonesia, Palo Alto and Petaluma in California, and some smaller towns in the San Francisco Bay Area. Neighboring McKinleyville and Eureka are creating similar systems, though they are loathe to admit it has anything to do with influence from Arcata. Replication is not always easy to trace. Multiple sources may be consulted. Sometimes communities try and fail, others adopt some aspects of the Arcata model, and still others may not yet have done so, but the 'seeds' are lying dormant, needing only a final impetus to start bearing fruit.

About datasets used in this table

All Topics

Population estimates, July 1, 2019, (V2019)

**Value Notes**

⚠ Estimates are not comparable to other geographic levels due to methodology differences that may exist between different data sources.

Some estimates presented here come from sample data, and thus have sampling errors that may render some apparent differences between geographies statistically indistinguishable. Click the Quick Info ⓘ icon to th row in TABLE view to learn about sampling error.

The vintage year (e.g., V2019) refers to the final year of the series (2010 thru 2019). *Different vintage years of estimates are not comparable.*

**Fact Notes**

- **(a)** Includes persons reporting only one race
- **(b)** Hispanics may be of any race, so also are included in applicable race categories
- **(c)** Economic Census - Puerto Rico data are not comparable to U.S. Economic Census data

**Value Flags**

- **-** Either no or too few sample observations were available to compute an estimate, or a ratio of medians cannot be calculated because one or both of the median estimates falls in the lowest or upper in open ended distribution.
- **D** Suppressed to avoid disclosure of confidential information
- **F** Fewer than 25 firms
- **FN** Footnote on this item in place of data
- **N** Data for this geographic area cannot be displayed because the number of sample cases is too small.
- **NA** Not available
- **S** Suppressed; does not meet publication standards
- **X** Not applicable
- **Z** Value greater than zero but less than half unit of measure shown

QuickFacts data are derived from: Population Estimates, American Community Survey, Census of Population and Housing, Current Population Survey, Small Area Health Insurance Estimates, Small Area Income and P Estimates, State and County Housing Unit Estimates, County Business Patterns, Nonemployer Statistics, Economic Census, Survey of Business Owners, Building Permits.

# 1.0 INTRODUCTION

This report presents the results of a geotechnical exploration performed by LACO Associates (LACO) in connection with the City of Arcata's existing wastewater treatment facility (WWTF) improvements project in Arcata, California. The WWTF is located on the northeast fringe of Arcata Bay at 736 F Street, approximately 0.4 miles west of U.S. Highway 101 in Arcata, California (the Site). The project also includes a proposed effluent pipeline beneath I Street, approximately 0.4 miles northwest of the WWTF. The Site in relation to adjacent streets and landmarks is presented in Figure 1 - Vicinity Map.

## 1.1 Project Description

The project consists of constructing improvements to the existing WWTF to replace/repair aging infrastructure, address deferred maintenance, maximize existing natural systems, and provide reliable capacity. Planned new improvements, along with their anticipated dimension, foundation elevations, loads, and occupancy categories, is presented in Table 1. The location of these improvements is shown on Figure 2 - Site Plans.

*Table 1. List of Improvement Components*

| Group | Improvement Component | Anticipated Plan Dimensions (feet) | Anticipated Foundation Elevation (feet) | Anticipated Foundation Loads (ksf) | Occupancy Category |
|---|---|---|---|---|---|
| 1 | Headworks | 22 x 52 | 3.3 | 2.5 | 3 |
| 1 | Headworks Wetwell | 17 x 15 | -1.9 | 2 | 3 |
| 1 | New ML Flow Split Structure | 29 x 22 | 6.3 | 2 | 3 |
| 1 | New RAS Pump Station | 26 x 40 | -3.8 | 1.5 | 3 |
| 1 | New WAS Pump Station | 18 x 18 | 8 | 1.5 | 3 |
| 1 | Oxidation ditch | 65 x 266 | 1.5 | 2 | 3 |

| 2 | New Transformer | 5 x 5 | 8 | 1.5 | 3 |

ksf–kips per square foot

Group 1 represents heavy and/or settlement-sensitive structures that if supported on shallow foundations will undergo excessive settlement. Group 2 represents lighter and less sensitive structures could be supported on shallow footings bearing on engineered fills. Groups have been determined with limited structural information and should reevaluated before the final design.

## 1.2 Scope of Services

LACO's scope of services is outlined in Task Order No. 1 issued by Carollo Engineers, Inc. (Carollo) and dated April 12, 2018.

# 2.0 EXPLORATION

On April 24 through 26, and May 7 through 10, 2018, LACO explored subsurface conditions at the Site by (1) advancing 11 cone penetration test (CPT) probes to a maximum depth of 60 feet below ground surface (bgs), and (2) drilling 7 test borings to a maximum depth of 51.5 feet bgs. Approximate CPT and test boring locations are shown in Figure 2. Under the direction of a LACO geologist, CPT probes were advanced by Gregg Drilling, Martinez, California using a 15 square centimeter ($cm^2$) standard cone. Test borings were drilled by Clear Heart Drilling, Inc. using a DR7K track-mounted drill rig equipped with an 8-inch diameter hollow stem auger, both. Our geologist logged the test borings in general accordance with the American Society for Testing and Materials (ASTM) D2488 and obtained relatively undisturbed and disturbed soil samples for visual classification and laboratory testing. Boring logs and CPT logs are presented in Appendix 1 and 2, respectively.

Soil samples collected during the exploration effort were transported to our laboratory in Eureka, California, where they were examined to confirm field classifications and select samples for laboratory testing. Selected soil samples were subjected to the following laboratory tests:

- Particle Size Finer than No. 200 sieve (ASTM C117);
- Atterberg Limits (ASTM D4318);
- Consolidation (ASTM D2435);
- Direct Shear (ASTM D3080);
- Unconfined Compressive Strength Test (ASTM D2166);
- Moisture Content (ASTM D2216) and Unit Weight (ASTM D2937); and,
- Basic Corrosivity (pH, resistivity, electrical conductivity, sulfate, chloride)

Laboratory test results are presented in Appendix 3 and summarized in Table 2 and in Boring Logs (Appendix 1). The computer program CPeT-IT v.2.0, developed by GeoLogismiki, Athens, Greece, was used to estimate soil properties; the results are presented in Appendix 4

*Table 2. Laboratory Test Results*

| Boring | Depth (feet bgs) | USCS Soil Type | Finer Than No. 200 Sieve (%) | Moisture / Density | | Atterberg Limits | | Direct Shear | | Unconfined Compressive Strength Test (psf) |

Φ- Internal Friction Angle (degrees)
pcf – pounds per cubic foot
psf – pounds per square foot

# 3.0 SITE AND SUBSURFACE CONDITIONS

## 3.1 Site Conditions

The Site is relatively flat, currently occupied by an existing wastewater treatment facility. The Site is situated in the marsh of the north-eastern edge of the Arcata Bay at approximately 10 feet above mean sea level.

## 3.2 Geologic Setting

The Site is located in the Coast Ranges geomorphic province which is characteristic of northwest-trending ridges and valleys running subparallel to the San Andreas Fault Zone. Prior to development, the site was in a tidally influenced marsh, that was reclaimed by covering the underlying delta marsh with imported fill soil. Published geologic maps (CDMG, 1983; McLaughlin et. al., 2000) indicate, the site is underlain by a layer of alluvial fan and marine deposits that include clays, silts, and fine sands. Coarser deposits of sand and gravel are present in isolated areas as discontinuous lenses within the otherwise fine grain deposits. At unknown depth, the alluvial deposits unconformably overlie poorly cemented alluvial deposits of the early to middle-Pleistocene Falor Formation. Based on the morphology of the slopes in the vicinity, the contact between the unconsolidated bay margin sediments and underlying poorly unconformably overlies the Jurassic to Cretaceous age Franciscan Formation bedrock.

## 3.3 Subsurface Conditions

Our exploration indicates the Site is blanketed by a layer of fill approximately 5 feet thick, marsh deposits (bay mud) approximately 40 to 60 feet thick, and old terrace deposits. The fill consists of dense clayey sand with gravel; bay mud consists of soft fat/elastic silt, clay and fine sand; and the terrace deposits consist of dense clayey sand that is comprised of fine to coarse sand with sub angular to rounded gravel. During drilling, free groundwater was encountered in our borings at depths between 2 to 8 feet bgs.

# 4.0 GEOLOGIC HAZARDS

## 4.1 Seismic Ground Shaking

The site is located in a seismically active region of California and thus will likely be subjected to severe ground shaking during the economic life of the project. The level of anticipated seismic ground shaking is a function of the following factors:

- The closest distance from the seismic source (fault system) to the site.
- The magnitude of the postulated earthquake on the fault system.

A splay of the Fickle Hill fault is approximately 1.3 miles northeast of the Site (CDMG, 1983). The upper-bound earthquake considered likely to occur on the nearby Fickle Hill fault has an estimated moment magnitude (mw) of 6.9 (ICBO-CDMG, 1998). Peak ground accelerations of at least 0.635 g (63.5 percent of the force of gravity), and possibly more, may be expected to occur on this site as a result of this regional design basis earthquake (Petersen et al, 1999; CGS 2008;).

Recent and ongoing research into the seismicity of the Pacific Northwest has shown that the Cascadia subduction zone is capable of generating major earthquakes which will affect the site. The Cascadia subduction zone marks the boundary between the North American plate and the subduction Gorda and Juan De Fuca plates. It extends from offshore of Cape Mendocino, Humboldt County, to Victoria Island, British Columbia, and is considered capable of rupturing along its entire length and generating an upper-bound earthquake with a Mw of 9.0 (Satake et. al., 2003). Seismic design parameters are presented in Recommendations section 6.8 and details presented in Appendix 5.

The site is not located within an Alquist-Priolo earthquake fault zone (CDMG, 2000). Therefore, the potential for active surface fault rupture to adversely affect the project site is considered low.

## 4.2 Liquefaction

A state of soil liquefaction occurs when, as a result of cyclic fluctuations in pore fluid pressure, sediment grains lose contact with one another, causing a loss of effective stress and consequently of shear strength. Liquefaction is most commonly initiated by earthquake ground motions. A soil in a saturated, loose state and one which may generate significant pore water pressure when sheared, is highly susceptible to liquefaction. Liquefaction is more likely to occur in sandy or non-plastic, silty soils, but may, in rare cases, occur in gravels and sensitive clays. Deposits most susceptible to liquefaction include young (Holocene-age, deposited within the last 10,000 years) sands and silts of similar grain size (poorly graded), in beds at least 1 meter thick, and saturated with water.

To evaluate the potential for induced liquefaction settlement to occur at the Site, we utilized the results obtained from CPT probes, laboratory tests, and Standard Penetration Test (SPT) data obtained from our test borings; site specific response analysis; and the computer program LiqSVs (by GeoLogismiki).

### *4.2.1 SPT Data Evaluations*

In our SPT data evaluations, we used the logs for test boring GBH-2, and GBH-5, a groundwater level during drilling of 4 and 6.5 feet bgs for GBH-2 and GBH-5, respectively, and assumed a groundwater level of 0 feet

during a hypothetical seismic event. Fine-grained soils with a plasticity index of 7 or greater that have fine grained fractions exceeding 35 percent were input as not liquefiable because they tend to exhibit clay-like behavior (Boulanger and Idriss 2006). The results of our analyses are presented in Appendix 6 and settlement values are summarized in Table 3.

*Table 3. Liquefaction Induced Settlement Estimates Calculated from SPT Data*

| Boring | Estimated Liquefaction Induced Settlement (inches) | Estimated Lateral Displacement (Feet) |
|---|---|---|
| GBH-2 | 10.3 | 12.0 |
| GBH-5 | 14.0 | 2.2 |

As shown, results indicate the potential for liquefaction induced settlement generated from the LiqSVs program is approximately 10 and 14 inches for GBH-2 and GBH-5, respectively.

To further evaluate the potential for liquefaction induced settlement we used CPT data and the computer software CLiq v.2.2.1.11 (by GeoLogismiki). The results of our analyses are presented in Appendix 7; settlement and lateral displacement estimates are summarized in Table 4.

*Table 4. Liquefaction Induced Settlement Estimates Calculated from CPT Data*

| Cone Penetration Test | Estimated Liquefaction Induced Settlement (inches) | Estimated Lateral Displacement (Feet) |
|---|---|---|
| CPT-1 | 7.1 | 7.8 |
| CPT-2 | 4.2 | 1.6 |
| CPT-3 | 4.6 | 2.2 |
| CPT-6 | 4.1 | 0 |
| CPT-9 | 2.2 | 0 |

### *4.2.2 Discussion*

As shown, SPT-based liquefaction induced settlement estimates range between 10 and 14 inches, CPT-based estimates range between 2.2 inches and 7.1 inches, with an average value of 4.4 inches. CPT based results tend to be more reliable as they provide an almost continuous penetration resistance profile for stratigraphic interpretation and the repeatability of the test results tend to be better than SPT based values (SCEC,1999). On this basis coupled with our experience, we judge that CPT based results (Table 4) are the more reliable settlement values.

## 4.3 Volcanism

According to the United States Geologic Survey (USGS) Volcano Hazards Program, the Site is not situated in a volcanically active area. The nearest volcano (Mt. Shasta) is located over 100 miles to the east. The likelihood of the Site experiencing active volcanism is low (USGS, 2017).

## 4.4 Slope Instability/Landsliding

Given the relatively flat site, we consider the potential for slope instability to adversely affect the Site to be negligible. This being said, heavy loads placed adjacent to waterfront areas on the site may result in slope instability given the soft, weak bay mud. In addition, as described in Section 4.2, liquefaction-induced lateral spreading magnitudes within approximately 200 feet of the shoreline have the potential to be significant.

## 4.5 Flooding

According to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps, (Map Number 06023C0852G, effective June 21, 2017), the Site is mapped as flood zone AE, which is inside of the special flood hazard area. A special flood hazard area is defined by the annual chance of a 100-year flood equaling or exceeding 1percent. Consequently, we conclude the likelihood of significant flooding occurring during the economic lifespan of the project is high (FEMA, 2017).

## 4.6 Tsunami Inundation

The Site resides in the Arcata South Quadrangle of the California Geological Survey (CGS) California Emergency Management Agency models a tsunami inundation map for emergency planning. Tsunami inundation was evaluated using a number of local and distance sources with moment magnitudes ranging from 8.4 to 9.4. The location in relation to projected tsunami inundation is shown in Figure 3.

## 4.7 High Groundwater

As noted in Section 3.3 of this report, groundwater was observed during our subsurface exploration between 2 to 8 feet bgs at the time drilling, with historically high groundwater levels judged to be less than 1 foot bgs. Consequently, the risk of encountering groundwater in relatively shallow utility trenches or other required earthwork excavations for the project is high.

## 4.8 Soil Corrosivity

Corrosion is the deterioration of a metal through a chemical reaction with its environment. Factors that contribute to corrosion potential include the presence of soluble salts, soil and water resistivity, soil and water pH, and the presence of oxygen.

Corrosion potential of soils in the vicinity of the proposed school building was assessed by obtaining 12 soil samples across the site. The samples were analyzed for sulfate, chloride, sulfide, resistivity, oxidation/reduction potential, and pH. The results of these tests are summarized in Table 5 with full lab results presented in Appendix 3

*Table 5. Corrosion Test Results*

| Sample | pH | Min. Resistivity (Ohm-cm) | Electrical Conductivity (µmhos/cm) | Sulfate (ppm) | Chloride (ppm) |
|---|---|---|---|---|---|

ppm – parts per million

For structural elements, CalTrans considers a site to be corrosive if one or more of the following conditions exist for the representative soil and/or water samples taken at the Site: chloride concentration is 500 ppm or greater, sulfate concentration is 2,000 ppm or greater, or the pH is 5.5 or less. A minimum resistivity value for soil and/or water less than 1,000 ohm-cm indicates the presence of high quantities of soluble salts and a higher propensity for corrosion (CDOT, 2012). As shown, the majority of the soil at the Site has a high propensity for corrosion. An engineer specializing in corrosion should be retained to evaluate whether or not a corrosion risk exists, and if so, design a system to minimize the detrimental effects of corrosion impacts to project components.

### 4.9 Soil Swelling or Shrinkage Potential

Expansive soils, generally consisting of cohesive fine-grained clay soils, represent a significant structural hazard to buildings founded on them, especially where seasonal fluctuations in soil moisture occur at the foundation-bearing depth. Surface soils encountered during our field exploration consist of coarse- and fine-grained soils, with a low expansion potential. However, marsh deposits below the fill possess relatively high expansive soil characteristics.

## 5.0 CONCLUSIONS

The results of our exploration indicate the project is feasible from a geotechnical engineering standpoint. As described above, the proximity of the Site to Arcata Bay exposes it to significant flooding and tsunami inundation risk. The primary geotechnical challenges include weak, compressible sandy clay/silt (bay mud) underlying the fill, and the potential for liquefaction induced settlement and lateral spreading in the event of a major earthquake.

Heavy and/or settlement-sensitive structures (Group 1) supported on shallow foundations will undergo excessive settlement (up to and in some instances exceeding 10 inches); lighter, less settlement sensitive (Group 2) structures constructed on shallow footings bearing on engineered fill will undergo total static settlement between 3 and 4 inches. Soil improvement techniques (e.g., surcharge loading and/or

preloading)[1] can be implemented to reduce consolidation settlement, however, these techniques will not ameliorate the potential for liquefaction induced settlement discussed in Section 4.2.

Following discussions with Carollo regarding settlement potential and mitigation options, it was decided that both Group 1 and 2 structures will be supported on driven piles deriving their load-carrying capacity in medium dense/stiff clayey sand/sandy clay underlying the bay mud at depths exceeding 40 feet below ground surface. If designed and constructed per the recommendations presented in this report, we estimate structures will undergo total static settlement of less than 1 inch, with differential settlement estimated at ½ inch over distance of approximately 20 feet.

As described previously, the potential for the liquefaction to occur at the site is high. Liquefaction consequences include significant ground surface settlement and lateral spreading, and downdrag loads on pile foundations. Mitigating the effects of liquefaction will by costly; conversely, ignoring this potential entirely could significantly affect the ability of the treatment facility to function after a major earthquake. In developing the recommendations that follow, LACO has attempted to provide recommendations to minimize the effects of liquefaction on planned new structures, and, where this is less than the case, has identified potential risks for designers to consider.

# 6.0 RECOMMENDATIONS

## 6.1 Site Preparation and Grading

Areas to be graded should be stripped of vegetation and soil containing organic material. The resulting subgrade should be scarified to a depth of 6 inches, moisture conditioned to near the optimum moisture content, and compacted to at least 90 percent relative compaction.[2] Fill meeting the requirements for structural fill described below should be placed on the prepared subgrade in layers, approximately 8 inches in loose thickness, moisture conditioned as necessary and compacted to 90 percent relative compaction. In pavement areas, the upper 6 inches of final subgrade should be compacted to 95 percent relative compaction.

Where circumstances are such that fill has be placed directly on bay mud, methods to stabilize the subgrade will likely be required. These methods may include at a minimum, a 12-inch thick layer of clean 3-inch minus crushed rock and a layer of triaxial geogrid (such as Tensar TX5 or equivalent).

To minimize ground surface settlement and thus downdrag loads on new and existing pile foundations, the net increase in site grades should be less than 1 foot.

---

[1] Preloading refers to placing fill material over a planned building site well in advance of building construction to strengthen soft cohesive soil and reduce settlement; surcharging refers to placing additional fill material on preload fill to reduce the time to achieve the desired strength increase and settlement reduction.

[2] Relative compaction refers to the ratio of the in place dry density of the soil to the maximum dry density as described in the latest addition of the ASTM D1557 compaction test procedure. Optimum moisture content is the water content as a percentage of the dry weight of the soil corresponding to the maximum dry density.

Structural fill should be composed of soil material having a low expansion potential and free of organic content, debris, and/or other deleterious matter. It should not contain rocks larger than 3 inches in greatest dimension, or more than 15 percent larger than 2 inches, and conform to the following requirements:

| | |
|---|---|
| Plasticity Index: | less than 15 percent |
| Liquid Limit: | less than 35 percent |
| Percent passing No. 200 sieve: | 50 maximum, 5 minimum |

Structural fill should be placed on an approved subgrade as described above. Subgrade soils should be kept wet until covered with structural fill. Our exploration indicates that the majority of on-site surficial fill is suitable for use as structural fill; soil underly the fill will be unsuitable for this purpose.

## 6.2 Foundations

### *6.2.1 Driven Piles*

Structures should be supported on driven piles deriving their load carrying capacity primarily via end bearing in medium dense to dense clayey sand below an approximate mean sea level elevation (EL.) -30. As requested, we have presented pile capacity recommendations for 12-, 14-, and 16-inch square precast prestressed concrete piles. Maximum allowable vertical pile capacity verses elevation graphs are presented in Figures 4 through 6. Practical driving refusal may be encountered at or below EL. 40. Piles driven to practical refusal (as defined in the subsequent section) may be capable of supporting the net allowable structural capacity of the pile. In order to achieve the necessary lateral load resistance, pile tips should extend at least 10 feet into medium dense to dense clayey sand which equates to a minimum tip elevation of EL. -40 in our subsurface conceptual model.

As shown, Figures 4 through 6 show plots for vertical downward capacity, vertical downward capacity accounting for the effects of downdrag, and uplift capacity. When evaluating the effects of liquefaction, the plots that contemplate downdrag should be used.

#### 6.2.1.1 *Pile Driving*

Piles should be driven continuously with a hammer developing at least 40,000 foot-pounds of energy until the design tip elevation or practical driving refusal is attained. Refusal blow count criteria should be evaluated during construction when the hammer size is known, and its efficiency known. For planning purposes, we suggest that the refusal blow count criteria shown on Table 6 be used.

*Table 6. Refusal Blow Count Criteria*

| Hammer Size (foot pounds) | Practical Refusal Blow Count (blows per foot) |
|---|---|
| 40,000 | 55 |
| 60,000 | 35 |

To facilitate penetration of surface fill and to reduce noise, we recommend pile locations be predrilled through the fill using an auger no greater than 2 inches less than the pile diameter.

Piles should be spaced a minimum of 6-pile widths, center-to-center or 3-pile widths if lateral load resistance is not provided by piles. (Pile spacing is discussed further in Section 6.2.1.4.) We believe the piles will penetrate

10 feet or more into the clayey sand layer below approximately EL. -30. Because the surficial fill was placed approximately 40 years ago, we believe that consolidation of the bay mud due to the fill is essentially complete. Consequently, if no significant amounts of fill are subsequently placed in the site vicinity, we judge that downdrag loads on the piles resulting from consolidation of the bay mud will be insignificant. However, as discussed in section 6.2.1, downdrag resulting from liquefaction remains a risk.

#### 6.2.1.2 *Indicator Piles*

Before production piles are cast, we recommend that a minimum of six indicator piles be driven. Where practical, they should be located near our test borings/CPT probes. We will assist your structural engineer in selecting indictor pile locations as required. The purpose of the indicator piles will be to (1) provide blow count data to correlate with information obtained from test borings/CPT probes, and (2) aid in estimating production pile lengths. Indicator piles should be driven with the same equipment that will be used to drive production piles. We recommend that indicator piles be at least 50 feet long.

#### 6.2.1.3 *Lateral Capacity*

The pile caps and the upper portion of the piles may be relied upon to develop resistance to lateral loads by passive bearing against the surrounding soil. For pile caps/grade beams in fill, we recommend a passive pressure of 300 pounds per cubic foot (pcf) equivalent fluid pressure. For pile caps in bay mud below the fill, use a uniform passive pressure of 1,000 pounds per square foot (psf). We estimate movement required to mobilize passive pressures in the fill and in the underlying bay mud will be approximately 1 inch and 2 inches, respectively (Wilson et al. 2010). These pressures should be assumed to act over an area defined by two pile widths and the upper five feet of the piles. Any voids around the pile caps should be backfilled with select fill and compacted as described in Section 6.1.

To evaluate load-deflection relationships of piles, and to evaluate associated shear and bending moments within the piles, LACO utilized the computer program L-Pile, developed by Ensoft, Inc., and the results of our exploration. From the L-Pile results, we developed plots of moment and shear resistance resulting from lateral pile head displacements of ½ inch and 1 inch for both free and fixed conditions. The results are summarized in Table 7 and 8, respectively, with detailed analysis results presented in Appendix 8.

*Table 7. Summary of LPile Results - 0.5-inch Deflection*

| | | Pile Width (12 in) | Pile Width (14 in) | Pile Width (16 in) |
|---|---|---|---|---|
| Fixed Head (Case 1) | Shear (kips) | 21.65 | 25.70 | 30.89 |
| | Depth (in) | 0 | 0 | 0 |
| | Moment (in-kips) | -840.27 | -1,086.50 | -1,491.54 |
| | Depth (in) | 0 | 0 | 0 |
| Free Head (Case 2) | Shear (kips) | 12.60 | 15.91 | 19.48 |
| | Depth (in) | 0 | 0 | 0 |
| | Moment (in-kips) | 447.90 | 591.44 | 772.44 |
| | Depth (in) | 54 | 60 | 78 |
| Fixed Head No Fill (Case 1) | Shear (kips) | 10.80 | 13.78 | 17.88 |
| | Depth (in) | 0 | 0 | 0 |
| | Moment (in-kips) | -689.54 | -941.63 | -1,355.97 |
| | Depth (in) | 0 | 0 | 0 |
| Free Head No Fill (Case 2) | Shear (kips) | 5.14 | 6.85 | 8.69 |
| | Depth (in) | 0 | 0 | 0 |
| | Moment (in-kips) | 306.57 | 458.51 | 642.56 |
| | Depth (in) | 96 | 108 | 126 |

- Shear and Moment values provided represent maximum values at dept indicated.
- Depth is from top of Pile

*Table 8. Summary of LPile Results 1-inch Deflection*

| | | Pile Width (12 in) | Pile Width (14 in) | Pile Width (16 in) |
|---|---|---|---|---|
| Fixed Head (Case 1) | Shear (kips) | 25.75 | 31.60 | 38.36 |
| | Depth (in) | 0 | 0 | 0 |
| | Moment (in-kips) | -1,029.13 | -1,349.28 | -1,773.06 |
| | Depth (in) | 0 | 0 | 0 |
| Free Head (Case 2) | Shear (kips) | 16.94 | 20.97 | 26.12 |
| | Depth (in) | 0 | 0 | 0 |
| | Moment (in-kips) | 652.86 | 822.62 | 1,091.68 |

| | Depth (in) | 108 | 120 | 132 |

- Shear and Moment values provided represent maximum values at dept indicated.
- Depth is from top of Pile

#### 6.2.1.4 *Pile Groups*

Pile groups (i.e., piles spaced less than approximately 6-pile diameters from one another) should be avoided if possible. Whether considering vertical or lateral load capacity, pile group capacity divided by the number of piles in the group will tend to be less than the capacity of an individual pile all else being equal. Pile group efficiency will tend to be higher when the pile, in relation to its diameter/width, is short, the spacing is wide and the number of the piles in the group low. Because piles are anticipated to develop their vertical load carrying capacity primarily in end bearing in non-cohesive soils, and efficiency of unity can be assumed.

With regarding lateral resistance then, capacity reduction or pile group efficiency changes significantly depending of the size and configuration of the pile group, pile fixity, and pile spacing. In addition, each pile within the group experience different loading scenarios and contribute to the overall lateral resistance of the cap: piles on the leading edge, particularly corner piles, contribute the greatest, while pile(s) within the outer pile circumference the least.

A detailed analysis of lateral resistance provided by a pile group requires a pile group configuration which is presently not available and in any case is beyond the scope of the present effort. This being said, if designers can maintain a pile spacing of 6 pile diameters, pile group effects can be minimized, and similarly, the need for detailed pile group evaluations reduced or eliminated.

## 6.3 Utilities

Underground utilities should avoid areas of abrupt changes in surface elevation which would impact differential settlement. Flexible connections should be employed where utilities cross from areas of new fill to existing streets or buildings. They should also be used where utilities connect to pile-supported structures and tanks. Because of the saline conditions, corrosion protection for buried utilities should be considered.

Utility trenches should be backfilled with clean, free-draining pea gravel where trench excavation extends below the ground-water table or below the bottom of the fill. Pea gravel should be compacted by vibrating during placement. Utility bench backfill under roads should be capped with at least 3 feet of subgrade fill compacted to 90 percent relative compaction and under native areas should be capped with at least 3 feet of bay mud fill compacted to at least 80 percent relative compaction.

When excavation extends into bay mud, soft clays stabilization fabric or crushed rock may be required to form an adequate working surface. Shallow groundwater was encountered during our exploration and should be anticipated during installation of underground utilities. Groundwater that accumulates in trenches should be pumped out prior to placement of fill, utilities or pipe bedding.

The contractor is responsible for the stability of temporary slopes and trenches excavated at the Site, and the design and construction of any required shoring. Shoring and bracing, if necessary, should be designed and constructed in accordance with applicable local, state, and federal safety regulations, including the current OSHA excavation and trench safety standards. Because of the potential for variable soil conditions, field modifications of temporary cut slopes may be required. Unstable materials encountered on the slopes during the excavation should be trimmed off, even if this requires cutting the slope back at flatter inclinations.

## 6.4 Retaining Walls

Retaining walls should be designed to resist the lateral earth pressures presented in Figure 7. Retaining walls free to rotate on the top should be designed to resist "active" lateral earth pressures; if walls are restrained to prevent rotation or supporting compacted engineered fill, they should be designed for "at-rest" lateral earth pressures. Retaining walls should be designed to resist the following equivalent fluid earth pressures:

| | |
|---|---|
| Active Pressure (level backfill) (5H:1V or less) | 40 psf/ft |
| At Rest Pressure (level backfill) (5H:1V or less) | 65 psf/ft |

Where vehicles may operate near the top of retaining walls, they should be designed using an additional 2 feet in height to account for traffic-induced surcharge loads. To reduce the potential for the buildup of hydrostatic pressure behind the walls, they should be designed with back drains as depicted in Figure 8. On-site soils containing at least 20 percent clay should be used for the top 12 inches to limit surface-water from flowing into the drain rock.

Retaining wall can be supported on shallow footings bearing on compacted fill. Footings should extend at least 12 inches below lowest adjacent grade and designed using a maximum allowable bearing pressures of 3,400 psf. This value can be increased by one-third when considering wind or seismic loads. below.

Retaining wall backfill should be placed and compacted as described in Section 6.1.

Retaining walls and backfill that extend above existing site grades may cause the underlying bay mud to consolidate resulting in settlement in response to the imposed loads. Where such improvements are planned, LACO should review then to check that induced settlement is tolerable.

Lateral load resistance may be developed via (1) friction between the footing bottoms and underlying soil, and (2) passive resistance between the vertical faces of footings. For design, use an allowable friction coefficient of 0.35 and a passive soil pressure of 300 pcf equivalent fluid pressure. Passive pressure should be neglected in the upper one-foot of soil unless confined by concrete slabs or pavements. If friction and passive resistances are to be combined, reduce the lesser value by 50 percent.

Footings adjacent to existing utility trenches or other footings should be deepened enough to bear below a 1:1 (horizontal to vertical) plane extending upwards from the bottom edge of the utility trench or footing excavation. A representative of the project geotechnical engineer should observe the footing excavations prior to the placement of reinforcing steel and concrete forms to see that they are founded in suitable bearing materials and have been properly cleaned of loose soil.

## 6.5 Concrete Slab-on-Grade Floors

Concrete slabs-on-grade should be constructed on a smooth, non-yielding subgrade. The upper 6 inches should be scarified, moisture conditioned to within 2 percent of the optimum moisture content and compacted to at least 90 percent relative compaction.

To provide a capillary moisture break between the slab and the supporting soil, we recommend the concrete slab be constructed on a 4-inch-thick layer of clean ¾ inch crushed rock. The crushed rock should be placed as soon as possible after moisture conditioning and compaction of the select subgrade materials to reduce the potential for drying and cracking of the subgrade soil. Where the risk of moisture vapor movement

through the slab may be detrimental to its intended use, the capillary break material should be covered by an impermeable membrane consisting of 15-mil Stego® Wrap sheeting, or equivalent, installed in accordance with the manufacturer's recommendations.

Special precautions should be taken during the placement and curing of concrete slabs. Excessive slump (high water-cement ratio) of the concrete and/or improper curing procedures used during either hot- or cold-weather conditions could lead to excessive shrinkage, cracking, or curling of the slabs. High water-cement ratio, and/or improper curing also greatly increase the water vapor permeability of concrete. We recommend concrete placement and curing operations be performed in accordance with the American Concrete Institute (ACI) manual.

## 6.6 Pavement

The soil subgrade in areas to be paved should be smooth and non-yielding. The upper 6 inches should be scarified, moisture conditioned to near the optimum moisture content, and compacted to at least 95 percent relative compaction. The laboratory test results on existing surface soil indicate an R-value of 30 is appropriate. Using this value, and CalTrans flexible pavement design procedures, we calculated pavement section thicknesses presented in Table 9.

*Table 9. Recommended Pavement Section Thicknesses*

| Location | Traffic Index | Hot Mix Asphalt (feet) | Aggregate Base (feet) |
|---|---|---|---|
| Parking Areas | 5 | 0.25 | 0.50 |
| Driveways | 6 | 0.30 | 0.67 |

Aggregate base should conform to the requirement for Class 2 Aggregate Base described in the CalTrans Standard Specifications, latest edition. It should be placed in layers not exceeding 8 inches in loose thickness, moisture conditioned to near the optimum moisture content and compacted to at least 95 percent relative compaction.

## 6.7 Surface Drainage

The Site should generally be graded to provide positive drainage away from foundations. A minimum gradient of 3 percent should be maintained for hardscaped areas. A minimum 5 percent gradient should be maintained for landscaped areas within 10 feet of a structure. The grading or landscaping design and construction should not allow water to pond on the Site nor to migrate beneath any structure. Runoff from hardscaped areas, roofs, patios, and other impermeable surfaces should be contained, controlled, collected, and directed to the Site storm drainage system.

## 6.8 Seismic Design Parameters

Earthquake design parameters are presented in the site-specific response analysis report presented in Appendix 5.

### 6.9 I Street Improvements

This project also includes a planned pipeline extending beneath a section of South I Street roadway located approximately 2,000 feet northwest of the wastewater treatment plant entrance (Figure 2). The Site is relatively flat and bounded by treatment wetlands. Our exploration for the planned new pipeline consisted of drilling 1 boring and advancing 2 CPT probes to a depth of 21.5 and 15 feet, respectively. Groundwater was encountered approximately 5 feet bgs. Borings and CPT probes indicate that the alignment is underlain by approximately 5 feet of fill that is in turn underlain by bay mud.

The results of our exploration indicate that the pipeline is feasible from a geotechnical engineering standpoint. Where the pipeline extends to or through the fill and into bay mud, construction impediments such as soft soil subgrade, the presence of groundwater, and caving/squeezing of trench sidewalls will need to be considered.

Soft soil subgrade can be stabilized by a layer of 1 ½ inch crushed rock underlain by a layer of geogrid (such as Tensar TX140, or equivalent). Although the bay mud underlying the fill is cohesive, sand layers/lenses within the bay mud may require a robust dewatering system to maintain groundwater levels at/below the trench bottom. To ameliorate caving, shoring may be required, especially where pipeline trenches extend more than 5 feet below the bottom of the fill. Pipeline settlement is anticipated to be within tolerable limits provided post-construction surface grades conform to pre-construction grades.

Pipe bedding should conform to pipe manufacturer's recommendations. It should be placed on a stable subgrade and should extend from trench bottom to a height up to 50 percent of the outside diameter of the pipe. Select fill should then be placed and compacted to a minimum 90 percent relative compaction following the recommendations presented in Section 6.1. Backfill should extend above the pipe a minimum of 30 inches or one-half the pipe diameter (whichever is greater) before power-operated hauling or rolling equipment is used over the pipe.

When evaluating the superimposed loads on buried pipes, use a unit weight of 130 pounds per cubic foot, a coefficient of friction of 0.35 and a Rankines ratio of 0.33. Use a modulus of subgrade reaction of 1,000 pounds per square inch (psi) for depths up to 10 feet of cover and a value of 1,400 psi for depths over 10 feet of cover.

## 7.0 FUTURE GEOTECHNICAL SERVICES

To further understand and quantify the depth to and character of the layer the will support driven pile foundations, we recommend additional subsurface exploration and engineering analysis be performed. The effort will also allow us an opportunity refine our recommendation as the design of WWTF improvements progress. Supplemental exploration would consist of at least three (3) additional cone penetrometer tests (CPTs) advanced at key locations across the site to allow minimum required pile lengths to be estimated more definitely and provide additional insight into liquefaction induced settlement and mitigation methods. This work is beyond our current scope of services and thus would be performed under a separate services agreement.

Upon completion of the design effort, LACO should be retained to review project plans and specifications to check for conformance with the intent of the recommendations presented in this report. During construction, we should observe the driving of indicator and production piles and observe the placement

and compaction of fill and backfill to check that the geotechnical aspects of the work is performed consistent with the construction drawings and specifications.

# 8.0 LIMITATIONS

This report has been prepared for the exclusive use of Carollo its contractors, and consultants; and appropriate public authorities for specific application to the development of the Site. LACO has exercised a standard of care equal to that generated for this industry to ensure that the information contained in this report is current and accurate.

Data generated for this report represent information gathered at that time and at the indicated locations. Subsurface conditions may change with time and under anthropologic influences. As such, recommendations included in this report are based, in part, on assumptions about subsurface conditions that may only be observed and/or tested during subsequent project earthwork. Accordingly, the validity of these recommendations is contingent upon review of subsurface conditions exposed during construction in order to check that they are consistent with those characterized in this report. Upon request, LACO can discuss the extent of (and fee for) observations and tests required to check the validity of the recommendations presented herein.

LACO disclaims any and all liability for any errors, omissions, or inaccuracies in the information and data presented in this report and/or any consequences arising therefrom, whether attributable to inadvertence or otherwise. LACO makes no representations or warranties of any kind including, but not limited to, any implied warranties with respect to the accuracy or interpretations of the data furnished. This report is valid solely for the purpose, site, and project described in this document. Any alteration, unauthorized distribution, or deviation from this description will invalidate this report. LACO assumes no responsibility for any third-party reliance on the data presented. Additionally, the data presented should not be utilized by any third-party to present data for any other time or location.

REUSE OF DOCUMENTS: This document and the ideas and design incorporated herein, as an instrument of professional service, is the property of LACO Associates and shall not be reused in whole or part for any other project without Laco Associates express written authorization.

NOTES:

(1) The above are soil pressures only and do not include lateral loads resulting from such as traffic, floor loads, adjacent foundations or other vertical loads.

(2) If the wall at surface of the backfill cannot yield about 0.1% of its height, at-rest soil pressures should be used.

(3) The above pressures assume a drained condition. See Figure 5 for drainage backfill details. If wall back drains are not provided for retaining walls, use the following combined earth and hydrostatic equivalent fluid pressures (triangular distributions).

| Wall Condition | Equivalent Fluid Pressure |
|---|---|
| Active | 40 pcf |
| At-Rest | 65 pcf |

(4) The above pressures should be used where backfill slope is flatter than 5 horizontal to 1 vertical (5H:1V).

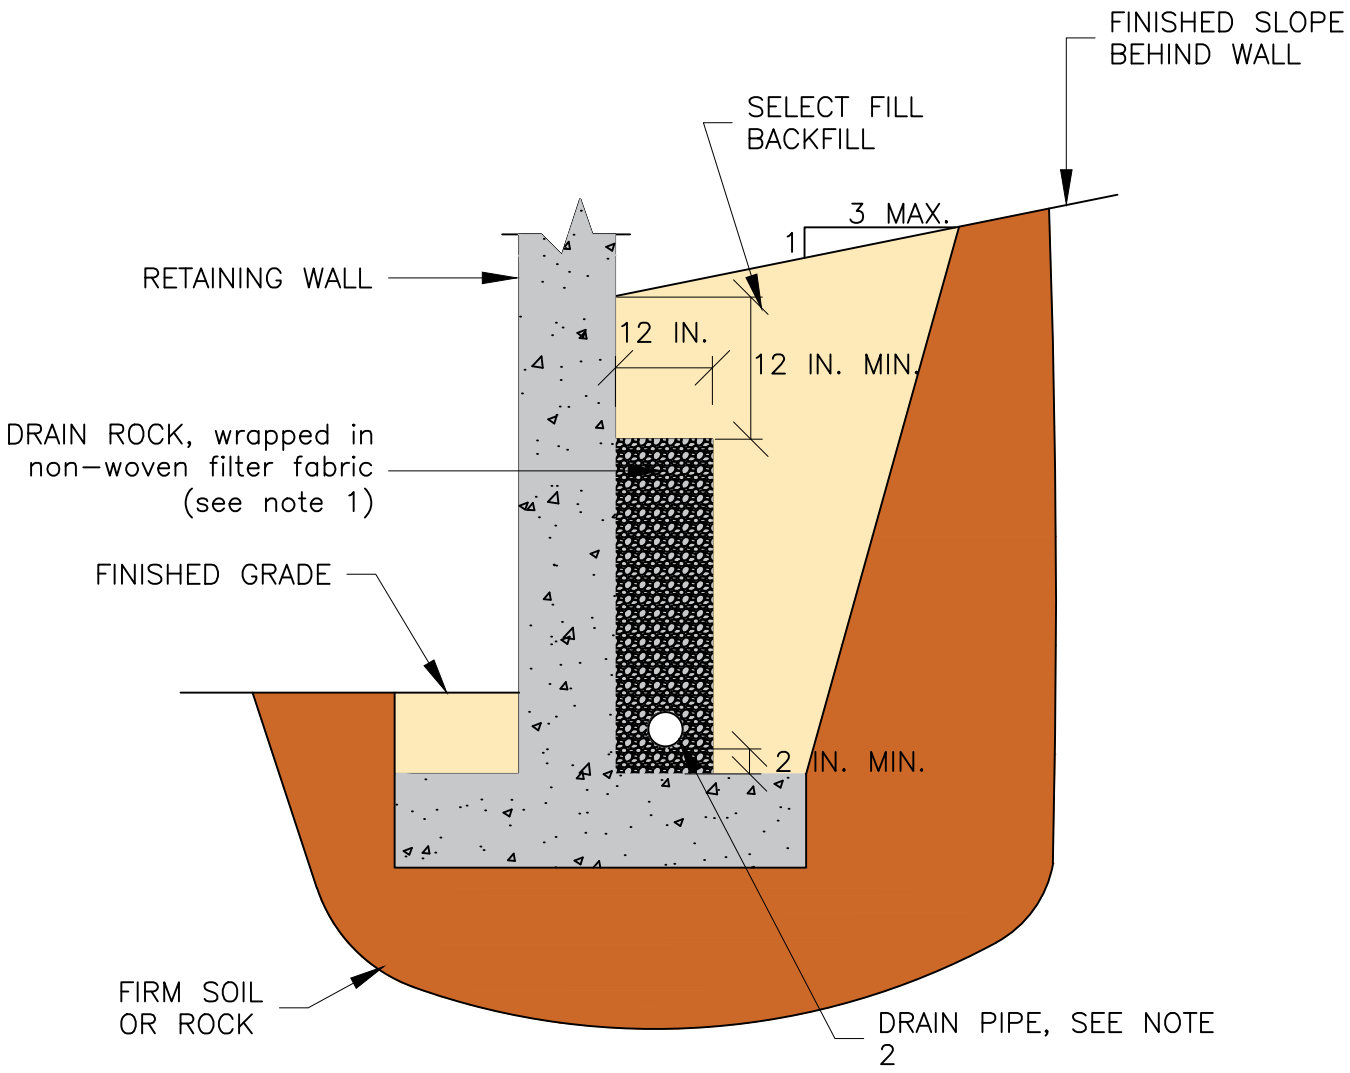
REUSE OF DOCUMENTS: This document and the ideas and design incorporated herein, as an instrument of professional service, is the property of LACO Associates and shall not be reused in whole or part for any other project without LACO Associates express written authorization.



**NOTES:**

(1) Drain rock should meet the Class 1 Type B permeable material requirements in the latest version of the Caltrans standard specifications.

(2) Drain pipe should be SDR 35 or equivalent, placed with perforation down, and sloped at a minimum of 1% to drain to gravity outlet or sump with automatic pump.

(3) A clean-out pipe with cap should be installed at the up-slope end of perforated pipe, and pipe elbows should be 45 degrees or less (for "snake" access)

Arcata Waste Water Treatment
Arcata, California
GREGG Project Number: 18-079-MA

Dear Ms. Meiswinkel:

The following report presents the results of GREGG Drilling & Testing's Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

| | | | |
|---|---|---|---|
| 1 | Cone Penetration Tests | (CPTU) | ☒ |
| 2 | Pore Pressure Dissipation Tests | (PPD) | ☒ |
| 3 | Seismic Cone Penetration Tests | (SCPTU) | ☐ |
| 4 | UVOST Laser Induced Fluorescence | (UVOST) | ☐ |
| 5 | Groundwater Sampling | (GWS) | ☐ |
| 6 | Soil Sampling | (SS) | ☐ |
| 7 | Vapor Sampling | (VS) | ☐ |
| 8 | Pressuremeter Testing | (PMT) | ☐ |
| 9 | Vane Shear Testing | (VST) | ☐ |
| 10 | Dilatometer Testing | (DMT) | ☐ |

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact our office at (562) 427-6899.

Sincerely,
GREGG Drilling & Testing, Inc.

Mary Walden
Operations Manager

Cone Penetration Test Sounding Summary

-Table 1-

| CPT Sounding Identification | Date | Termination Depth (feet) | Depth of Groundwater Samples (feet) | Depth of Soil Samples (feet) | Depth of Pore Pressure Dissipation Tests (feet) |
|---|---|---|---|---|---|
| CPT-01 | 4/26/2018 | 60.04 | - | - | - |
| CPT-02 | 4/25/2018 | 49.87 | - | - | 44.6 |
| CPT-03 | 4/26/2018 | 50.03 | - | - | - |
| CPT-04 | 4/25/2018 | 14.93 | - | - | - |
| CPT-05 | 4/25/2018 | 14.93 | - | - | - |
| CPT-06 | 4/26/2018 | 49.87 | - | - | - |
| CPT-07 | 4/25/2018 | 14.93 | - | - | - |
| CPT-08 | 4/25/2018 | 15.09 | - | - | - |
| CPT-09 | 4/25/2018 | 60.04 | - | - | - |
| CPT-10 | 4/26/2018 | 14.93 | - | - | - |
| CPT-11 | 4/26/2018 | 14.93 | - | - | - |

# Cone Penetration Testing Procedure (CPT)

Gregg Drilling carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, *Figure CPT*.

The cone takes measurements of tip resistance ($q_c$), sleeve resistance ($f_s$), and penetration pore water pressure ($u_2$). Measurements are taken at either 2.5 or 5 cm intervals during penetration to provide a nearly continuous profile. CPT data reduction and basic interpretation is performed in real time facilitating on-site decision making. The above mentioned parameters are stored electronically for further analysis and reference. All CPT soundings are performed in accordance with revised ASTM standards (D 5778-12).

The 5mm thick porous plastic filter element is located directly behind the cone tip in the $u_2$ location. A new saturated filter element is used on each sounding to measure both penetration pore pressures as well as measurements during a dissipation test (*PPDT*). Prior to each test, the filter element is fully saturated with oil under vacuum pressure to improve accuracy.

When the sounding is completed, the test hole is backfilled according to client specifications. If grouting is used, the procedure generally consists of pushing a hollow tremie pipe with a "knock out" plug to the termination depth of the CPT hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.

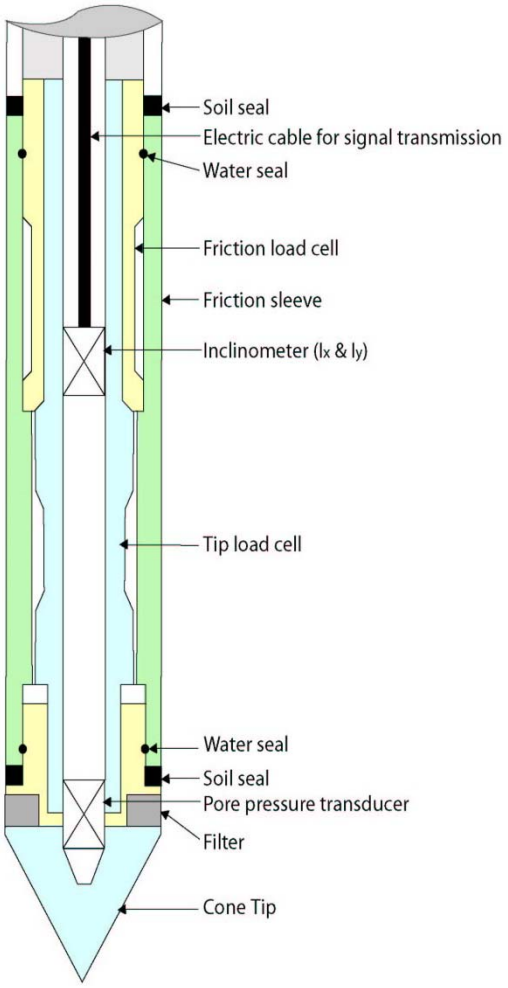

*Figure CPT*

Gregg 15cm$^2$ Standard Cone Specifications

| Dimensions | |
|---|---|
| Cone base area | 15 cm$^2$ |
| Sleeve surface area | 225 cm$^2$ |
| Cone net area ratio | 0.80 |
| | |
| **Specifications** | |
| **Cone load cell** | |
| Full scale range | 180 kN (20 tons) |
| Overload capacity | 150% |
| Full scale tip stress | 120 MPa (1,200 tsf) |
| Repeatability | 120 kPa (1.2 tsf) |
| | |
| **Sleeve load cell** | |
| Full scale range | 31 kN (3.5 tons) |
| Overload capacity | 150% |
| Full scale sleeve stress | 1,400 kPa (15 tsf) |
| Repeatability | 1.4 kPa (0.015 tsf) |
| | |
| **Pore pressure transducer** | |
| Full scale range | 7,000 kPa (1,000 psi) |
| Overload capacity | 150% |
| Repeatability | 7 kPa (1 psi) |

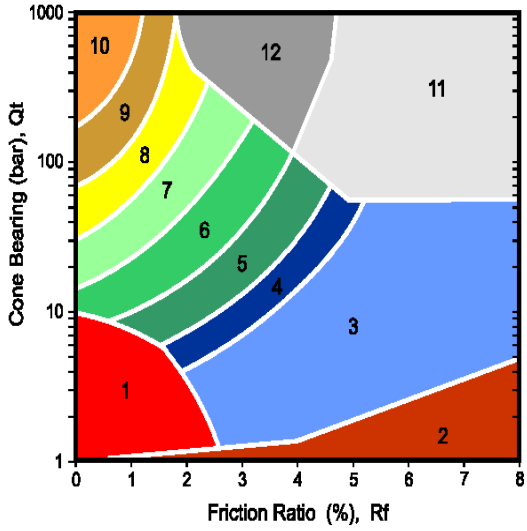
*Note: The repeatability during field use will depend somewhat on ground conditions, abrasion, maintenance and zero load stability.*

# Cone Penetration Test Data & Interpretation

The Cone Penetration Test (CPT) data collected are presented in graphical and electronic form in the report. The plots include interpreted Soil Behavior Type (SBT) based on the charts described by Robertson (1990). Typical plots display SBT based on the non-normalized charts of Robertson et al (1986). For CPT soundings deeper than 30m, we recommend the use of the normalized charts of Robertson (1990) which can be displayed as SBTn, upon request. The report also includes spreadsheet output of computer calculations of basic interpretation in terms of SBT and SBTn and various geotechnical parameters using current published correlations based on the comprehensive review by Lunne, Robertson and Powell (1997), as well as recent updates by Professor Robertson (Guide to Cone Penetration Testing, 2015). The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg Drilling & Testing Inc. does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software. Some interpretation methods require input of the groundwater level to calculate vertical effective stress. An estimate of the in-situ groundwater level has been made based on field observations and/or CPT results, but should be verified by the user.

A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Note that it is not always possible to clearly identify a soil type based solely on $q_t$, $f_s$, and $u_2$. In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the correct soil behavior type.



| ZONE | | SBT |
|---|---|---|
| 1 | | Sensitive, fine grained |
| 2 | | Organic materials |
| 3 | | Clay |
| 4 | | Silty clay to clay |
| 5 | | Clayey silt to silty clay |
| 6 | | Sandy silt to clayey silt |

# Cone Penetration Test (CPT) Interpretation

Gregg uses a proprietary CPT interpretation and plotting software. The software takes the CPT data and performs basic interpretation in terms of soil behavior type (SBT) and various geotechnical parameters using current published empirical correlations based on the comprehensive review by Lunne, Robertson and Powell (1997). The interpretation is presented in tabular format using MS Excel. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

The following provides a summary of the methods used for the interpretation. Many of the empirical correlations to estimate geotechnical parameters have constants that have a range of values depending on soil type, geologic origin and other factors. The software uses 'default' values that have been selected to provide, in general, conservatively low estimates of the various geotechnical parameters.

**Input:**

1 Units for display (Imperial or metric) (atm. pressure, $p_a$ = 0.96 tsf or 0.1 MPa)
2 Depth interval to average results (ft or m). Data are collected at either 0.02 or 0.05m and can be averaged every 1, 3 or 5 intervals.
3 Elevation of ground surface (ft or m)
4 Depth to water table, $z_w$ (ft or m) – input required
5 Net area ratio for cone, a (default to 0.80)
6 Relative Density constant, $C_{Dr}$ (default to 350)
7 Young's modulus number for sands, α (default to 5)
8 Small strain shear modulus number
  a. for sands, $S_G$ (default to 180 for $SBT_n$ 5, 6, 7)
  b. for clays, $C_G$ (default to 50 for $SBT_n$ 1, 2, 3 & 4)
9 Undrained shear strength cone factor for clays, $N_{kt}$ (default to 15)
10 Over Consolidation ratio number, $k_{ocr}$ (default to 0.3)
11 Unit weight of water, (default to $\gamma_w$ = 62.4 lb/ft$^3$ or 9.81 kN/m$^3$)

**Column**

1 Depth, z, (m) – CPT data is collected in meters
2 Depth (ft)
3 Cone resistance, $q_c$ (tsf or MPa)
4 Sleeve resistance, $f_s$ (tsf or MPa)
5 Penetration pore pressure, u (psi or MPa), measured behind the cone (i.e. $u_2$)
6 Other – any additional data
7 Total cone resistance, $q_t$ (tsf or MPa) $q_t = q_c + u\,(1-a)$

| | | |
|---|---|---|
| 8 | Friction Ratio, $R_f$ (%) | $R_f = (f_s/q_t) \times 100\%$ |
| 9 | Soil Behavior Type (non-normalized), SBT | see note |
| 10 | Unit weight, γ (pcf or kN/m$^3$) | based on SBT, see note |
| 11 | Total overburden stress, $\sigma_v$ (tsf) | $\sigma_{vo} = \sigma\, z$ |
| 12 | In-situ pore pressure, $u_o$ (tsf) | $u_o = \gamma_w (z - z_w)$ |
| 13 | Effective overburden stress, $\sigma'_{vo}$ (tsf ) | $\sigma'_{vo} = \sigma_{vo} - u_o$ |
| 14 | Normalized cone resistance, $Q_{t1}$ | $Q_{t1} = (q_t - \sigma_{vo}) / \sigma'_{vo}$ |
| 15 | Normalized friction ratio, $F_r$ (%) | $F_r = f_s / (q_t - \sigma_{vo}) \times 100\%$ |
| 16 | Normalized Pore Pressure ratio, $B_q$ | $B_q = u - u_o / (q_t - \sigma_{vo})$ |
| 17 | Soil Behavior Type (normalized), $SBT_n$ | see note |
| 18 | $SBT_n$ Index, $I_c$ | see note |
| 19 | Normalized Cone resistance, $Q_{tn}$ (n varies with $I_c$) | see note |
| 20 | Estimated permeability, $k_{SBT}$ (cm/sec or ft/sec) | see note |
| 21 | Equivalent SPT $N_{60}$, blows/ft | see note |
| 22 | Equivalent SPT $(N_1)_{60}$ blows/ft | see note |
| 23 | Estimated Relative Density, $D_r$, (%) | see note |
| 24 | Estimated Friction Angle, ϕ', (degrees) | see note |
| 25 | Estimated Young's modulus, $E_s$ (tsf) | see note |
| 26 | Estimated small strain Shear modulus, Go (tsf) | see note |
| 27 | Estimated Undrained shear strength, $s_u$ (tsf) | see note |
| 28 | Estimated Undrained strength ratio | $s_u/\sigma_v'$ |
| 29 | Estimated Over Consolidation ratio, OCR | see note |

**Notes:**

1 Soil Behavior Type (non-normalized), SBT (Lunne et al., 1997 and table below)

2 Unit weight, γ either constant at 119 pcf or based on Non-normalized SBT (Lunne et al., 1997 and table below)

3 Soil Behavior Type (Normalized), $SBT_n$ Lunne et al. (1997)

4 $SBT_n$ Index, $I_c$ $I_c = ((3.47 - \log Q_{t1})^2 + (\log F_r + 1.22)^2)^{0.5}$

5 Normalized Cone resistance, $Q_{tn}$ (n varies with Ic)

$Q_{tn} = ((q_t - \sigma_{vo})/pa)\ (pa/(\sigma'_{vo})^n$ and recalculate $I_c$, then iterate:

When $I_c < 1.64$, n = 0.5 (clean sand)
When $I_c > 3.30$, n = 1.0 (clays)
When $1.64 < I_c < 3.30$, $n = (I_c - 1.64)0.3 + 0.5$
Iterate until the change in n, $\Delta n < 0.01$

6 Estimated permeability, $k_{SBT}$ based on Normalized $SBT_n$ (Lunne et al., 1997 and table below)

7 Equivalent SPT $N_{60}$, blows/ft Lunne et al. (1997)

$$\frac{(q_t/p_a)}{N_{60}} = 8.5\left(1 - \frac{I_c}{4.6}\right)$$

8 Equivalent SPT $(N_1)_{60}$ blows/ft $(N_1)_{60} = N_{60}\, C_N$,
where $C_N = (pa/\sigma'_{vo})^{0.5}$

9 Relative Density, $D_r$, (%) $D_r^2 = Q_{tn} / C_{Dr}$
*Only $SBT_n$ 5, 6, 7 & 8* *Show 'N/A' in zones 1, 2, 3, 4 & 9*

10 Friction Angle, ϕ', (degrees) $\tan\phi' = \frac{1}{2.68}\left[\log\left(\frac{q_c}{\sigma'_{vo}}\right) + 0.29\right]$
*Only $SBT_n$ 5, 6, 7 & 8* *Show'N/A' in zones 1, 2, 3, 4 & 9*

11 Young's modulus, $E_s$ $E_s = \alpha\, q_t$
*Only $SBT_n$ 5, 6, 7 & 8* *Show 'N/A' in zones 1, 2, 3, 4 & 9*

12 Small strain shear modulus, Go

a. $G_o = S_G\,(q_t\ \sigma'_{vo}\ pa)^{1/3}$ *For $SBT_n$ 5, 6, 7*

b. $G_o = C_G\, q_t$ *For $SBT_n$ 1, 2, 3& 4*

*Show 'N/A' in zones 8 & 9*

13 Undrained shear strength, $s_u$ $s_u = (q_t - \sigma_{vo}) / N_{kt}$
*Only $SBT_n$ 1, 2, 3, 4 & 9* *Show 'N/A' in zones 5, 6, 7 & 8*

14 Over Consolidation ratio, OCR $OCR = k_{ocr}\, Q_{t1}$
*Only $SBT_n$ 1, 2, 3, 4 & 9* *Show 'N/A' in zones 5, 6, 7 & 8*

The following updated and simplified SBT descriptions have been used in the software:

| **SBT Zones** | | **$SBT_n$ Zones** | |
|---|---|---|---|
| 1 | sensitive fine grained | 1 | sensitive fine grained |
| 2 | organic soil | 2 | organic soil |
| 3 | clay | 3 | clay |
| 4 | clay & silty clay | 4 | clay & silty clay |
| 5 | clay & silty clay | | |
| 6 | sandy silt & clayey silt | | |

| | | | |
|---|---|---|---|
| 7 | silty sand & sandy silt | 5 | silty sand & sandy silt |
| 8 | sand & silty sand | 6 | sand & silty sand |
| 9 | sand | | |
| 10 | sand | 7 | sand |
| 11 | very dense/stiff soil* | 8 | very dense/stiff soil* |
| 12 | very dense/stiff soil* | 9 | very dense/stiff soil* |

*heavily overconsolidated and/or cemented

Track when soils fall with zones of same description and print that description (i.e. if soils fall only within SBT zones 4 & 5, print 'clays & silty clays')

**Estimated Permeability** (see Lunne et al., 1997)

| $SBT_n$ | Permeability (ft/sec) | (m/sec) |
|---|---|---|
| 1 | $3x\ 10^{-8}$ | $1x\ 10^{-8}$ |
| 2 | $3x\ 10^{-7}$ | $1x\ 10^{-7}$ |
| 3 | $1x\ 10^{-9}$ | $3x\ 10^{-10}$ |
| 4 | $3x\ 10^{-8}$ | $1x\ 10^{-8}$ |
| 5 | $3x\ 10^{-6}$ | $1x\ 10^{-6}$ |
| 6 | $3x\ 10^{-4}$ | $1x\ 10^{-4}$ |
| 7 | $3x\ 10^{-2}$ | $1x\ 10^{-2}$ |
| 8 | $3x\ 10^{-6}$ | $1x\ 10^{-6}$ |
| 9 | $1x\ 10^{-8}$ | $3x\ 10^{-9}$ |

**Estimated Unit Weight** (see Lunne et al., 1997)

| SBT | Approximate Unit Weight ($lb/ft^3$) | ($kN/m^3$) |
|---|---|---|
| 1 | 111.4 | 17.5 |
| 2 | 79.6 | 12.5 |
| 3 | 111.4 | 17.5 |
| 4 | 114.6 | 18.0 |
| 5 | 114.6 | 18.0 |
| 6 | 114.6 | 18.0 |
| 7 | 117.8 | 18.5 |
| 8 | 120.9 | 19.0 |
| 9 | 124.1 | 19.5 |
| 10 | 127.3 | 20.0 |
| 11 | 130.5 | 20.5 |
| 12 | 120.9 | 19.0 |

# Pore Pressure Dissipation Tests (PPDT)

Pore Pressure Dissipation Tests (PPDT's) conducted at various intervals can be used to measure equilibrium water pressure (at the time of the CPT). If conditions are hydrostatic, the equilibrium water pressure can be used to determine the approximate depth of the ground water table. A PPDT is conducted when penetration is halted at specific intervals determined by the field representative. The variation of the penetration pore pressure (*u)* with time is measured behind the tip of the cone and recorded.

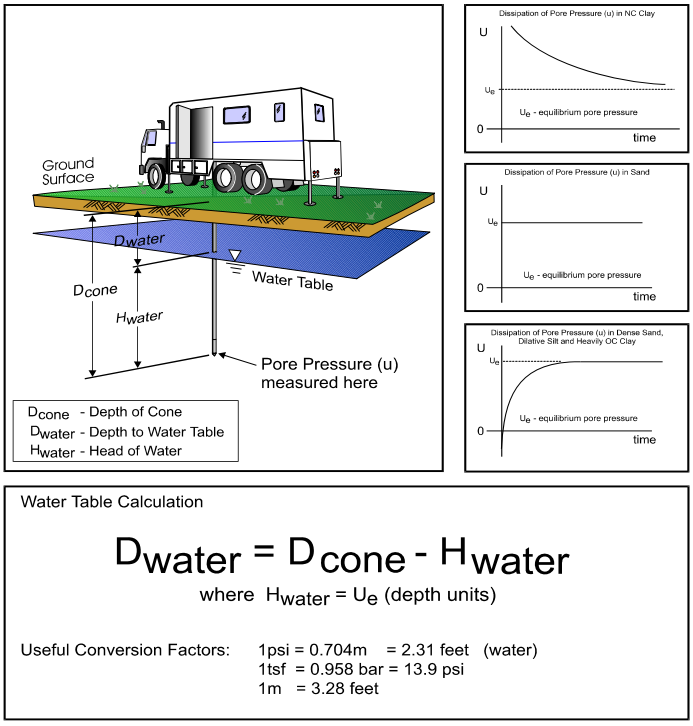
Pore pressure dissipation data can be interpreted to provide estimates of:

- Equilibrium piezometric pressure
- Phreatic Surface
- In situ horizontal coefficient of consolidation ($c_h$)
- In situ horizontal coefficient of permeability ($k_h$)

In order to correctly interpret the equilibrium piezometric pressure and/or the phreatic surface, the pore pressure must be monitored until it reaches equilibrium, *Figure PPDT*. This time is commonly referred to as $t_{100}$, the point at which 100% of the excess pore pressure has dissipated.

A complete reference on pore pressure dissipation tests is presented by Robertson et al. 1992 and Lunne et al. 1997.

A summary of the pore pressure dissipation tests are summarized in Table 1.



Water Table Calculation

$$D_{water} = D_{cone} - H_{water}$$

where $H_{water} = U_e$ (depth units)

Useful Conversion Factors: 1psi = 0.704m = 2.31 feet (water)
1tsf = 0.958 bar = 13.9 psi
1m = 3.28 feet

*Figure PPDT*

# Seismic Cone Penetration Testing (SCPT)

Seismic Cone Penetration Testing (SCPT) can be conducted at various intervals during the Cone Penetration Test. Shear wave velocity (Vs) can then be calculated over a specified interval with depth. A small interval for seismic testing, such as 1-1.5m (3-5ft) allows for a detailed look at the shear wave profile with depth. Conversely, a larger interval such as 3-6m (10-20ft) allows for a more average shear wave velocity to be calculated. Gregg's cones have a horizontally active geophone located 0.2m (0.66ft) behind the tip.

To conduct the seismic shear wave test, the penetration of the cone is stopped and the rods are decoupled from the rig. An automatic hammer is triggered to send a shear wave into the soil. The distance from the source to the cone is calculated knowing the total depth of the cone and the horizontal offset distance between the source and the cone. To calculate an interval velocity, a minimum of two tests must be performed at two different depths. The arrival times between the two wave traces are compared to obtain the difference in time (Δt). The difference in depth is calculated (Δd) and velocity can be determined using the simple equation: $v = \Delta d/\Delta t$

Multiple wave traces can be recorded at the same depth to improve quality of the data.

A complete reference on seismic cone penetration tests is presented by Robertson et al. 1986 and Lunne et al. 1997.

A summary the shear wave velocities, arrival times and wave traces are provided with the report.

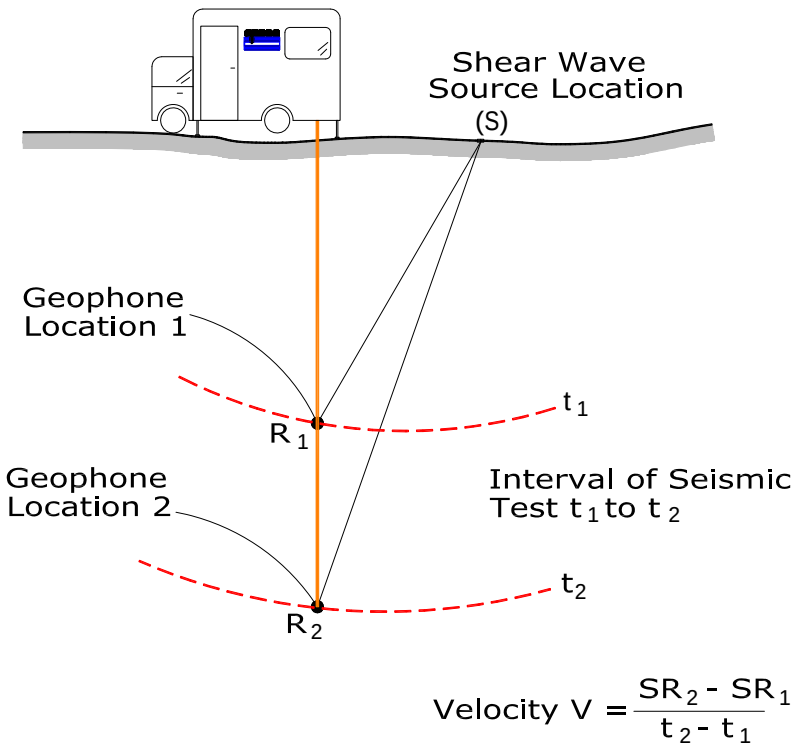


*Figure SCPT*

# Groundwater Sampling

Gregg Drilling & Testing, Inc. conducts groundwater sampling using a sampler as shown in *Figure GWS*. The groundwater sampler has a retrievable stainless steel or disposable PVC screen with steel drop off tip. This allows for samples to be taken at multiple depth intervals within the same sounding location. In areas of slower water recharge, provisions may be made to set temporary PVC well screens during sampling to allow the pushing equipment to advance to the next sample location while the groundwater is allowed to infiltrate.

The groundwater sampler operates by advancing 44.5mm (1¾ inch) hollow push rods with the filter tip in a closed configuration to the base of the desired sampling interval. Once at the desired sample depth, the push rods are retracted; exposing the encased filter screen and allowing groundwater to infiltrate hydrostatically from the formation into the inlet screen. A small diameter bailer (approximately ½ or ¾ inch) is lowered through the push rods into the screen section for sample collection. The number of downhole trips with the bailer and time necessary to complete the sample collection at each depth interval is a function of sampling protocols, volume requirements, and the yield characteristics and storage capacity of the formation. Upon completion of sample collection, the push rods and sampler, with the exception of the PVC screen and steel drop off tip are retrieved to the ground surface, decontaminated and prepared for the next sampling event.

*For a detailed reference on direct push groundwater sampling, refer to Zemo et. al., 1992.*

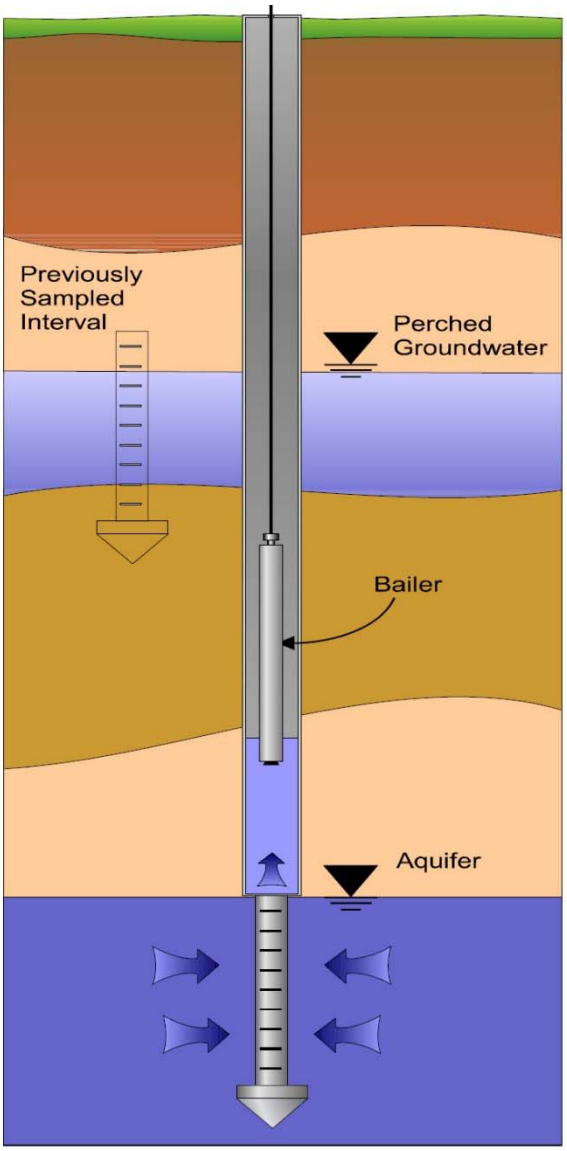

*Figure GWS*

# Soil Sampling

Gregg Drilling & Testing, Inc. uses a piston-type push-in sampler to obtain small soil samples without generating any soil cuttings, *Figure SS*. Two different types of samplers (12 and 18 inch) are used depending on the soil type and density. The soil sampler is initially pushed in a "closed" position to the desired sampling interval using the CPT pushing equipment. Keeping the sampler closed minimizes the potential of cross contamination. The inner tip of the sampler is then retracted leaving a hollow soil sampler with inner 1¼" diameter sample tubes. The hollow sampler is then pushed in a locked "open" position to collect a soil sample. The filled sampler and push rods are then retrieved to the ground surface. Because the soil enters the sampler at a constant rate, the opportunity for 100% recovery is increased. For environmental analysis, the soil sample tube ends are sealed with Teflon and plastic caps. Often, a longer "split tube" can be used for geotechnical sampling.

*For a detailed reference on direct push soil sampling, refer to Robertson et al, 1998.*

**********  COMMENTS  **********

Resistivities are at >500 ohm-cm, i.e., poor or <500 ohm-cm, i.e., very poor, and soil reactions (i.e., pHs) are mildly to moderately alkaline; sulfates are very mildly to greatly elevated (@ >200 & >1,000 ppm), and chlorides are very mildly to greatly elevated (i.e., @ >100 & >2,000 ppm); two sulfides are at a trace levels (@ >0.1 ppm); soils are moderately (@ 100-200 mV) to strongly reduced (@ <100 mV). The CalTrans (CT) times to perforation and full depth pitting times (following Uhlig) for these soils are determined based on the pertinent parameters [see table at left below]. Sulfate could have minor (WWTP1 & 2) to moderate (WWTP3) adverse impacts on concrete, cement, mortar or grout; chloride might have a very mild (WWTP1) to strong (WWTP2 & 3) adverse impact on rebar or buried steel in these soils. Indeed, calculated times to failure of std rebar in std cement is just 24-25 year in WWTP2 & 3; and is at ~55 yrs in WWTP1. In principle, lime or cement treatment would not be of any benefit in these soils because their pHs are already in the 7.5-8.5 range. Reducing pH in WWTP3 could readily be accomplished with the appropriate conditioner, although it is not very much over the upper limit. To increase longevity any more in these soils would require steel upgrading and/or other actions. All three of these soils would rate as very to extremely corrosive as they have high total point values. Thus, taking actions for their remediation and protection of construction materials would be necessary in all three cases. Various options for remediation include cathodic protection along with coating or wrapping steel assets; or specialized engineering fill, use of polymer or other coatings, or the use of plastic, fiberglass or concrete assets. Upgrading concrete mixes and rebar would be prudent, especially in WWTP2 & WWTP3 due to high levels of Cl, and elevated SO4 in WWTP3.

**********COMMENTS**********

Resistivities are at <1,000 & <500 ohm-cm, i.e., poor to very poor or >1,250 ohm-cm, i.e., low, and soil reactions (i.e., pHs) are moderately alkaline to very milldy acidic; sulfates are very mildly to mildly elevated (@ >200 & >1,000 ppm), and chlorides are very mildly to highly elevated (i.e., @ >100 & >1,000 ppm); one sulfide is at a trace level (@ >0.1 ppm); soils are moderately (@ 100-200 mV) to strongly reduced (@ <100 mV). The CalTrans (CT) times to perforation and full depth pitting times (following Uhlig) for these soils are determined based on the pertinent parameters [see table at left below]. Sulfate could have some minor adverse impact, especially in WWTP5, on concrete, cement, mortar or grout; chloride might have a very mild (WWT61) to mild (WWTP5) to moderate (WWTP4) adverse impact on rebar or buried steel in these soils. Indeed, calcuated times to failure of std rebar in std cement are just 34.5 & ~38 yrs in WWTP4 & 5; it is about 58 years in WWTP6. In principle, lime or cement treatment could be of benefit in one of these soils (WWTP6) in that raising soil pH to the 7.5-8.5 range would significantly increase perf and pitting times of this soil; this does not happen in WWTP5 due to passivation. To increase longevity any more in these soils would require steel upgrading and/or other actions. All three soils would rate as very to extremely corrosive as they have high total point values. Thus, taking actions for their remediation and protection of construction materials would be necessary in all three cases. Various options for remediation include cathodic protection along with coating or wrapping the steel assets; or specialized engineering fill, use of polymer or other coatings, or the use of plastic, fiberglass or concrete assets. Upgrading of concrete mixes and rebar would be prudent, especially in WWTP4 & WWTP5 due to elevated to high levels of Cl and SO4.

**********COMMENTS**********

Resistivities are at <500 ohm-cm, i.e., very poor or >500 ohm-cm, i.e., poor, and soil reactions (i.e., pHs) are basically mildly alkaline; two sulfates are mildly elevated (@ >500 ppm), and chlorides are mildly to hugely elevated (i.e., @ >500 ppm & @ >5,000 ppm); all sulfides are at a minuscule level (i.e., @ <0.1 ppm); soils are moderately (@ 100-200 mV) to strongly reduced (@ <100 mV). The CalTrans (CT) times to perforation and full depth pitting times (following Uhlig) for these soils are determined based on the pertinent parameters [see table at left below]. Sulfate could have some minor adverse impact in WWTP7 & 8 on concrete, cement, mortar or grout; chlorides might have a mild (WWTP9) but would have a strong (WWTP7 & 8) adverse impact on rebar or buried steel in these soils. Indeed, calculated times to failure of std rebar in std cement are only about 15-16 years in WWTP7 & 8, and at <39 years in WWTP9. In principle, lime or cement treatment would not be of any benefit in these soils because their pHs are already in the 7.5-8.5 range. To increase longevity any more in these soils would require steel upgrading and/or other actions. All three of these soils would rate as very to extremely corrosive as they have high total point values. Thus, taking actions for their remediation and protection of construction materials would be necessary in all three cases. Some options for remediation include cathodic protection along with coating or wrapping steel assets; or specialized engineering fill, use of polymer or other coatings, or the use of plastic, fiberglass or concrete assets. Upgrading concrete mixes and rebar would be prudent, especially in WWTP8 & WWTP9 due to very high levels of Cl, and elevated SO4.

**********  COMMENTS  **********

Resistivities are at >2,500, >1,500 ohm-cm, and <1,000, i.e., fair to mediocre to poor, and soil reactions (i.e., pHs) are basically very milldy acidic; sulfates are low (@ >200 ppm), and chlorides are very mildly to mildly elevated (@ >100 & >500 ppm); one of the sulfides is at a trace level (@ >0.1 ppm), but they other two are minuscule (@ <0.1 ppm); soils are moderately reduced (@ 100-200 mV). The CalTrans (CT) times to perforation and full depth pitting times (following Uhlig) for these soils are determined based on the pertinent parameters [see table at left below]. Sulfate would have no measureable adverse impact on concrete, cement, mortar or grout; but chloride might have a very mild (WWT10 & 11) to mild (WWTP12) adverse impact on rebar or buried steels. Times to failure of std rebar in std cement are put at 60 yrs, <54 yrs & <39 yrs. In principle, lime or cement treatment could be of benefit in two soils (WWTP10 & 11) in that raising pHs to the 7.5-8.5 range would significantly increase perf and pitting times. To increase longevity any more in these soils would require steel upgrading and/or other actions. Only one soil (WWTP12) would rate as very corrosive with a fairly high total point value; the other two are somewhat corrosive due to pHs and redoxes, and sulfides in one case. Thus, taking actions for their remediation and protection of construction materials would be necessary at least for WWTP12, and probably would be prudent to some degree for the other two. Various options for remediation include cathodic protection along with coating or wrapping the steel assets; or specialized engineering fill, use of polymer or other coatings, or the use of plastic, fiberglass or concrete assets. Upgrading concrete mixes and rebar would be prudent, especially in the case of WWTP12 due to its low resistivity, elevated Cl, and a moderately strong redox.

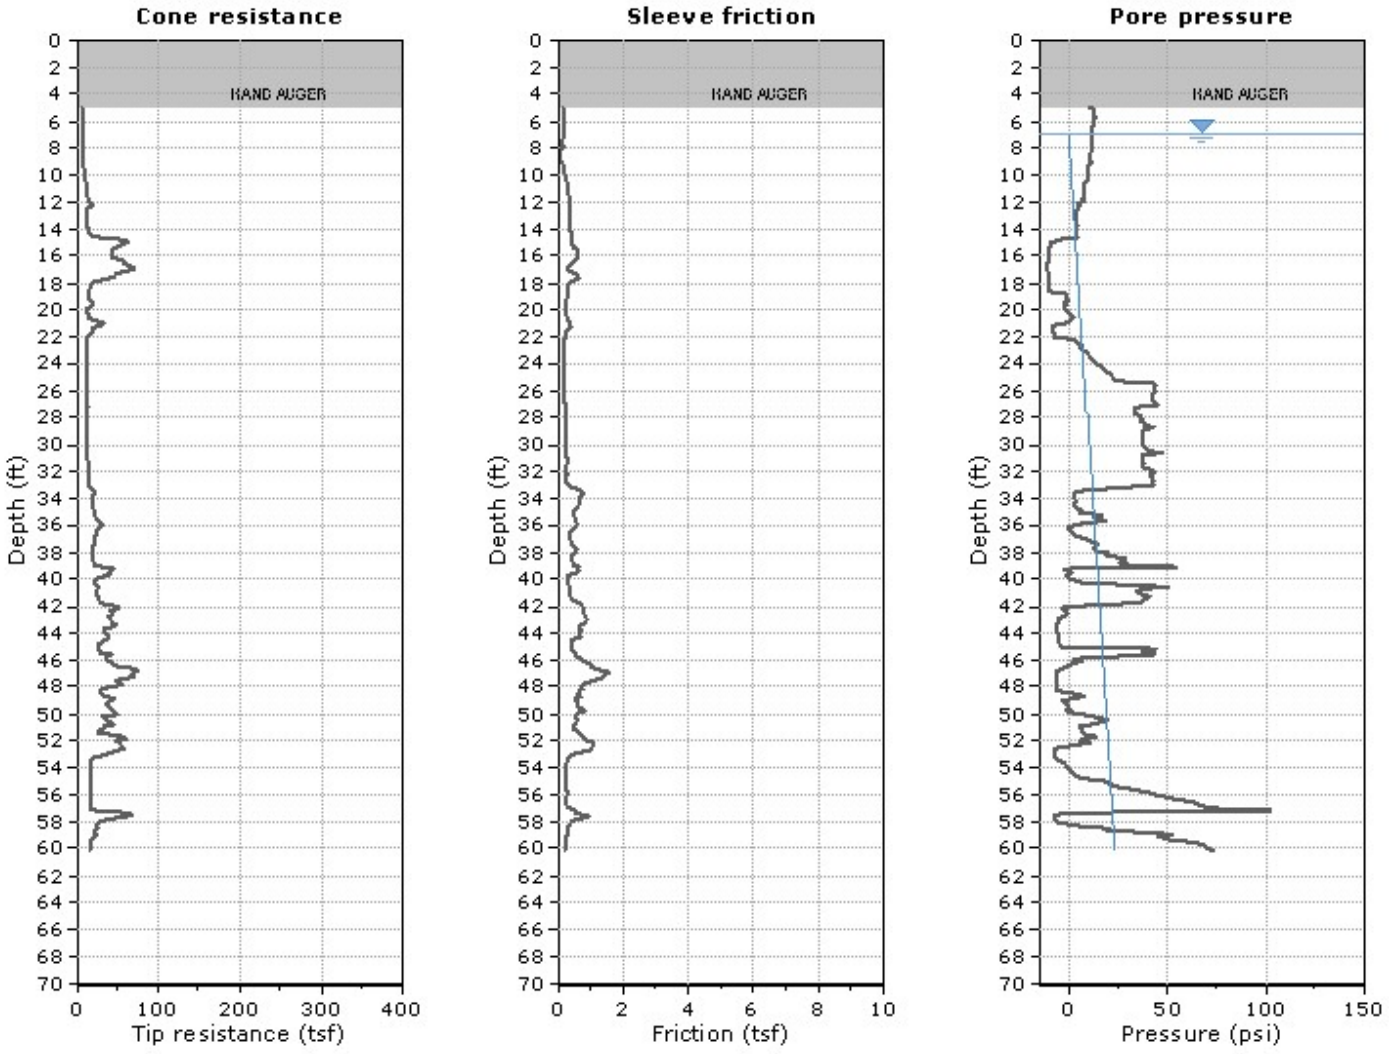
\\\\NOTES: Methods are from following sources: extractions by Cal Trans protocols as per Cal Test 417 (SO4), 422 (Cl), and 532/643 (pH & resistivity); &/or by ASTM Vol. 4.08 & ASTM Vol. 11.01 (=EPA Methods of Chemical Analysis, or Standard Methods); pH - ASTM G 51; Spec. Cond. - ASTM D 1125; resistivity - ASTM G 57; redox - Pt probe/ISE; sulfate - extraction Title 22, detection ASTM D 516 (=EPA 375.4); chloride - extraction Title 22, detection ASTM D 512 (=EPA 325.3); sulfides - extraction by Title 22, and detection EPA 376.2 (= SMEWW 4500-S D); cyanides - extraction by Title 22, and detection by ASTM D 4374 (=EPA 335.2).

# APPENDIX 4

## CPT Analysis



The plot below presents the cross correlation coeficient between the raw qc and fs values (as measured on the field). X axes presents the lag distance (one lag is the distance between two sucessive CPT measurements).

**Calculation parameters**

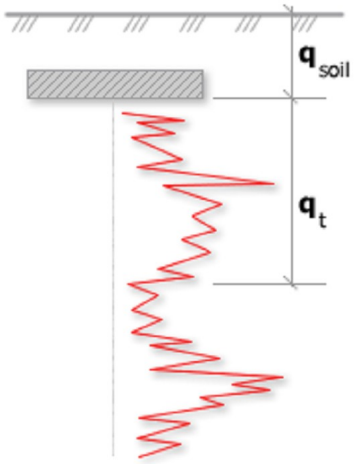
Soil Sensitivity factor, $N_S$: 7.00

User defined estimation data



Bearing Capacity calculation is perfromed based on the formula:

$$Q_{ult} = R_k \times q_t + q_{soil}$$

where:
$R_k$: Bearing capacity factor
$q_t$: Average corrected cone resistance over calculation depth
$q_{soil}$: Pressure applied by soil above footing

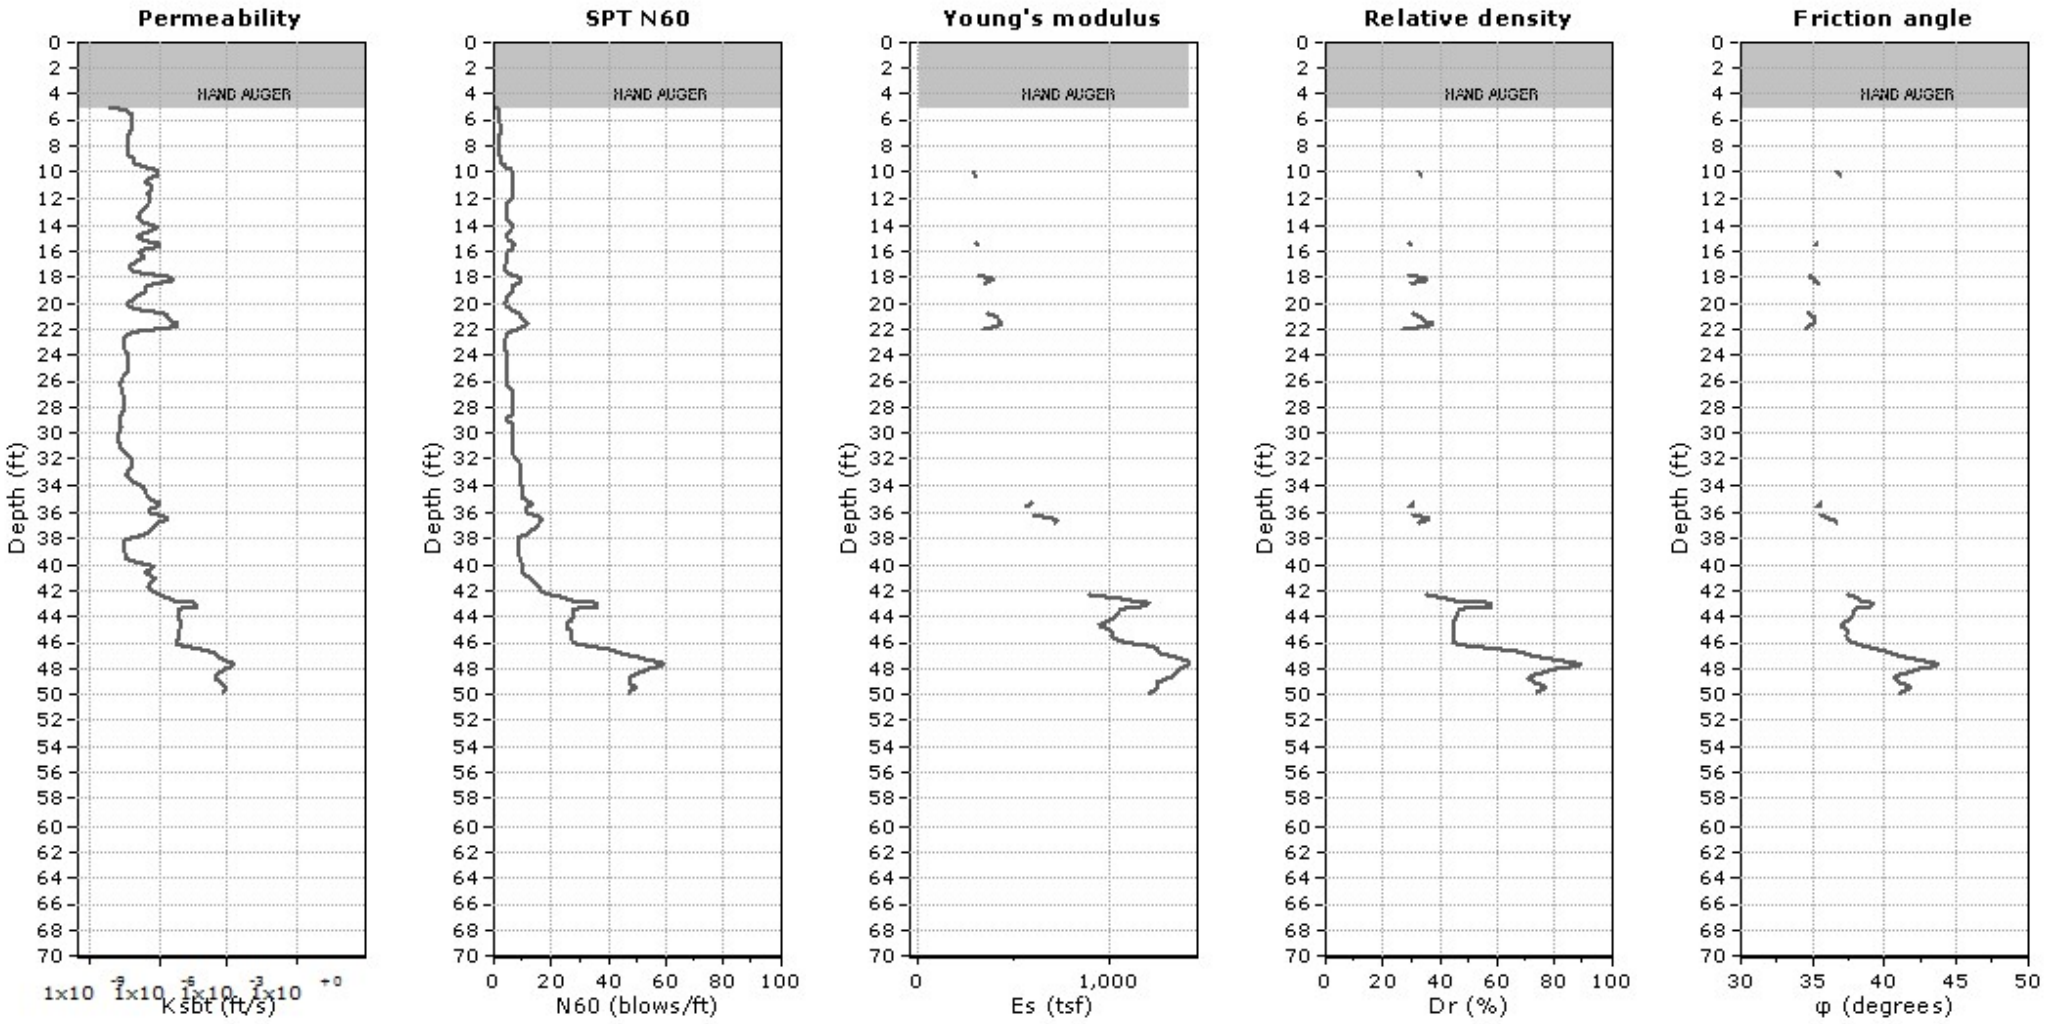
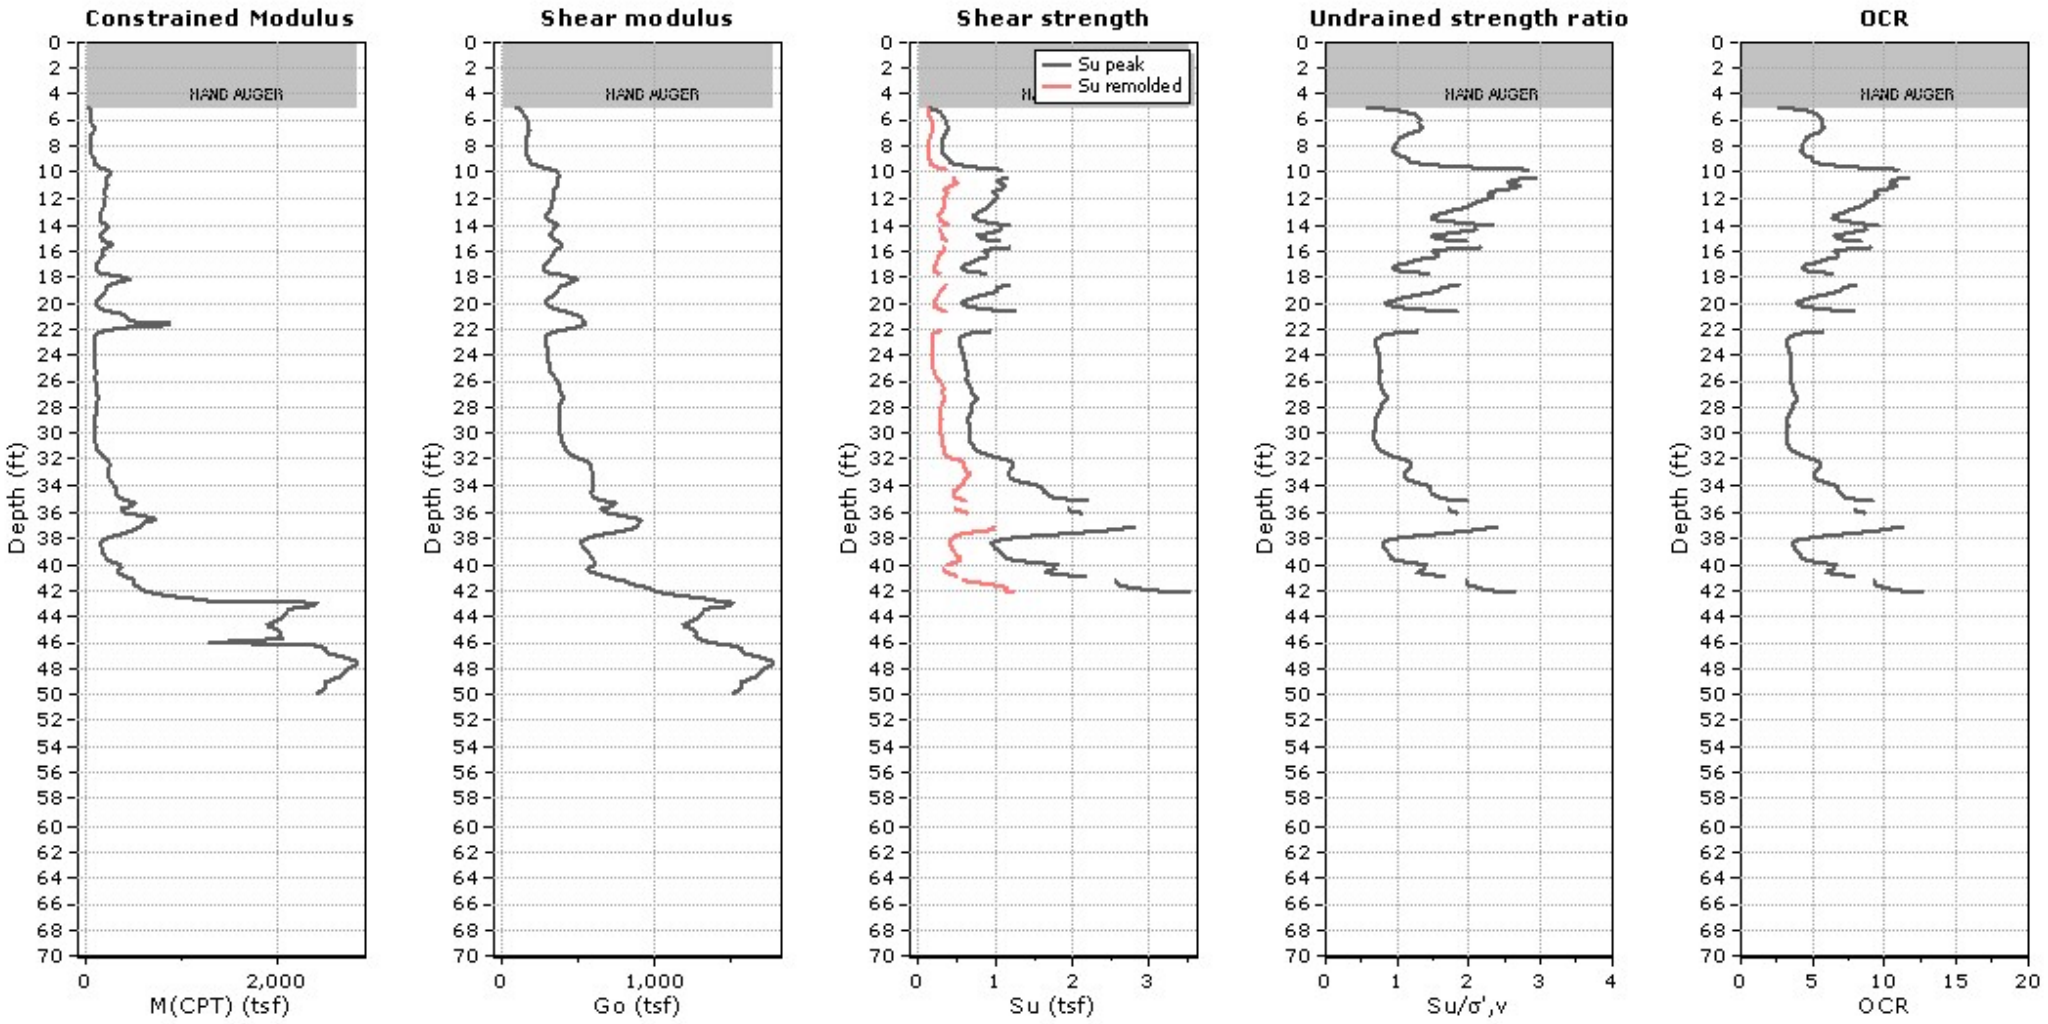
K(G) > 330: Soils with significant microstructure (e.g. age/cementation)



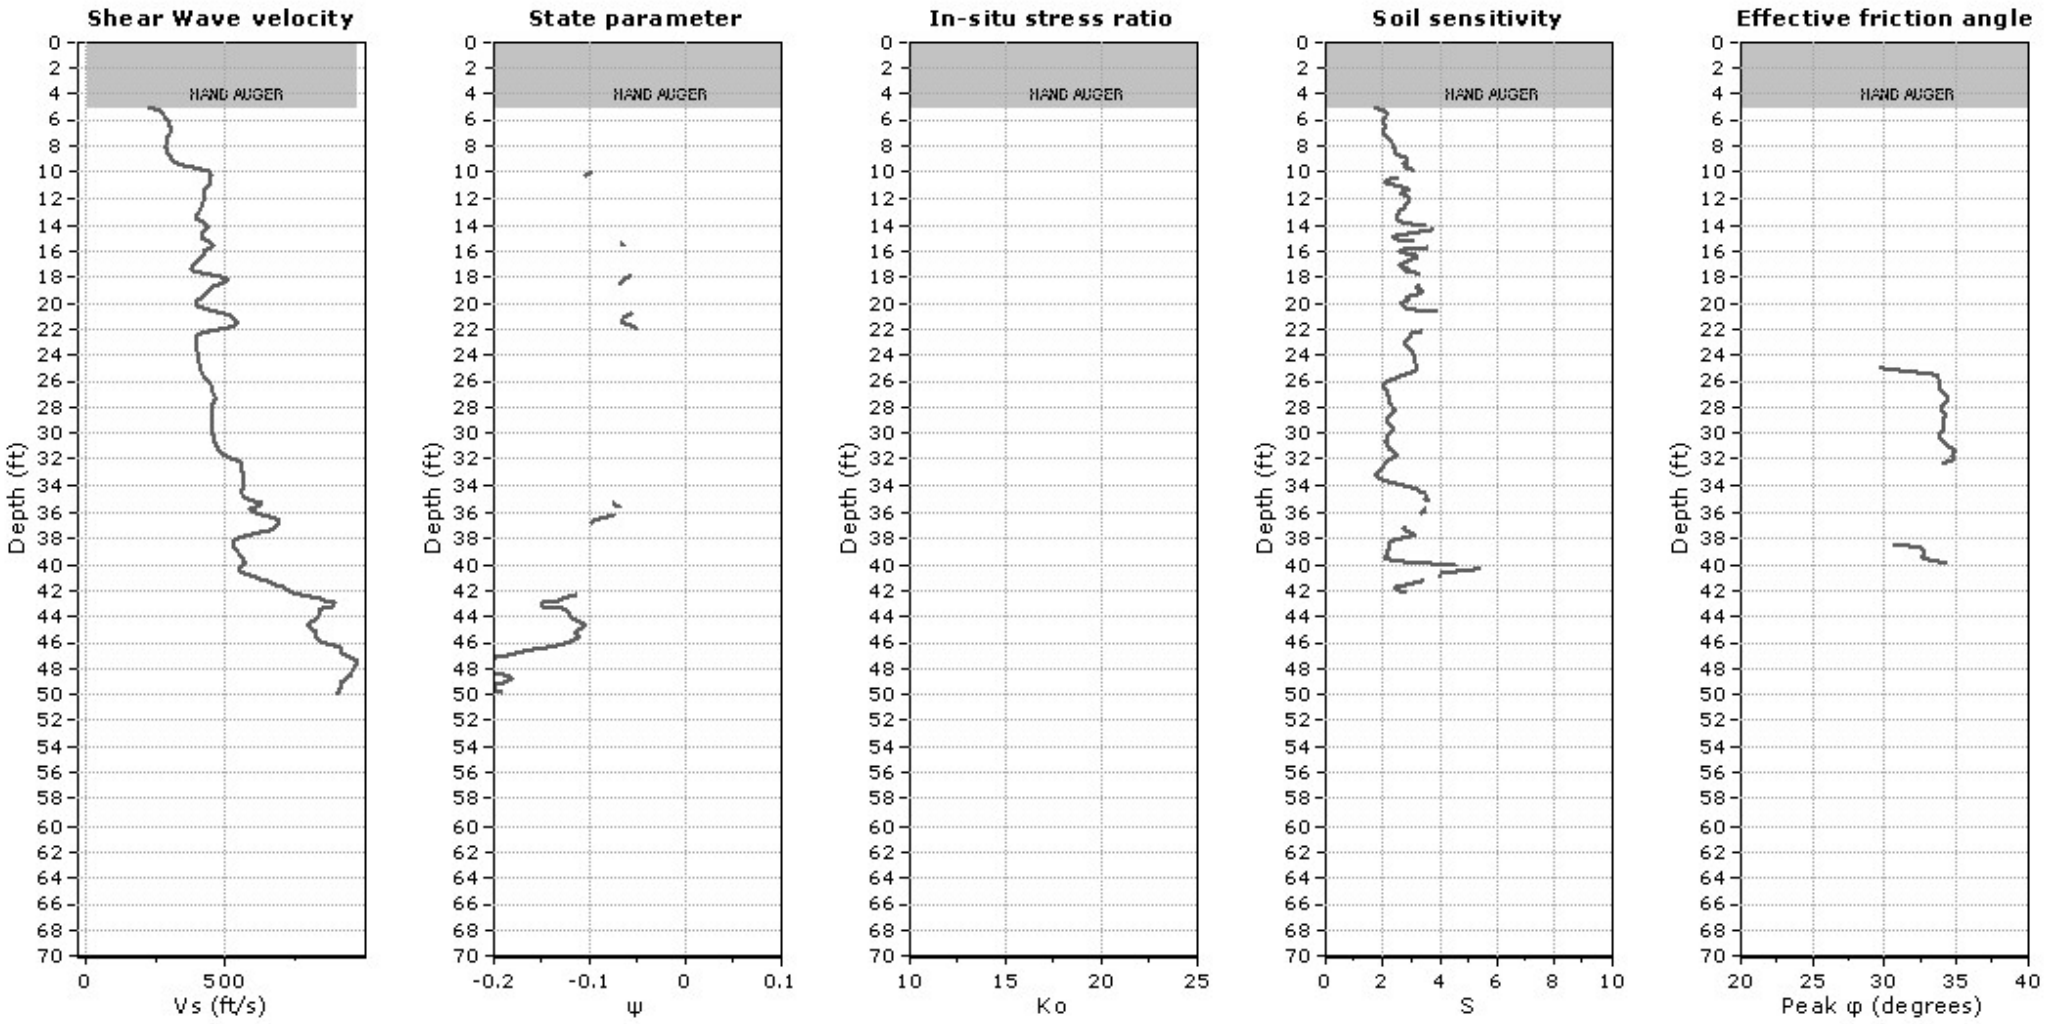
**Calculation parameters**

Permeability: Based on $SBT_n$
SPT $N_{60}$: Based on $I_c$ and $q_t$
Young's modulus: Based on variable alpha using $I_c$ (Robertson, 2009)
Relative density constant, $C_{Dr}$: 350.0
Phi: Based on Kulhawy & Mayne (1990)
User defined estimation data



**Calculation parameters**

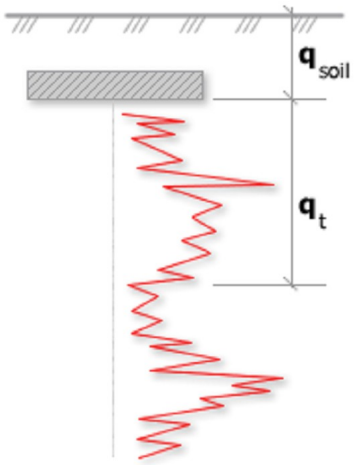
Constrained modulus: Based on variable alpha using $I_c$ and $Q_{tn}$ (Robertson, 2009)
Go: Based on variable alpha using $I_c$ (Robertson, 2009)
Undrained shear strength cone factor for clays, $N_{kt}$: 14
OCR factor for clays, $N_{kt}$: 0.33
User defined estimation data
Flat Dilatometer Test data



**Calculation parameters**

Soil Sensitivity factor, $N_S$: 7.00

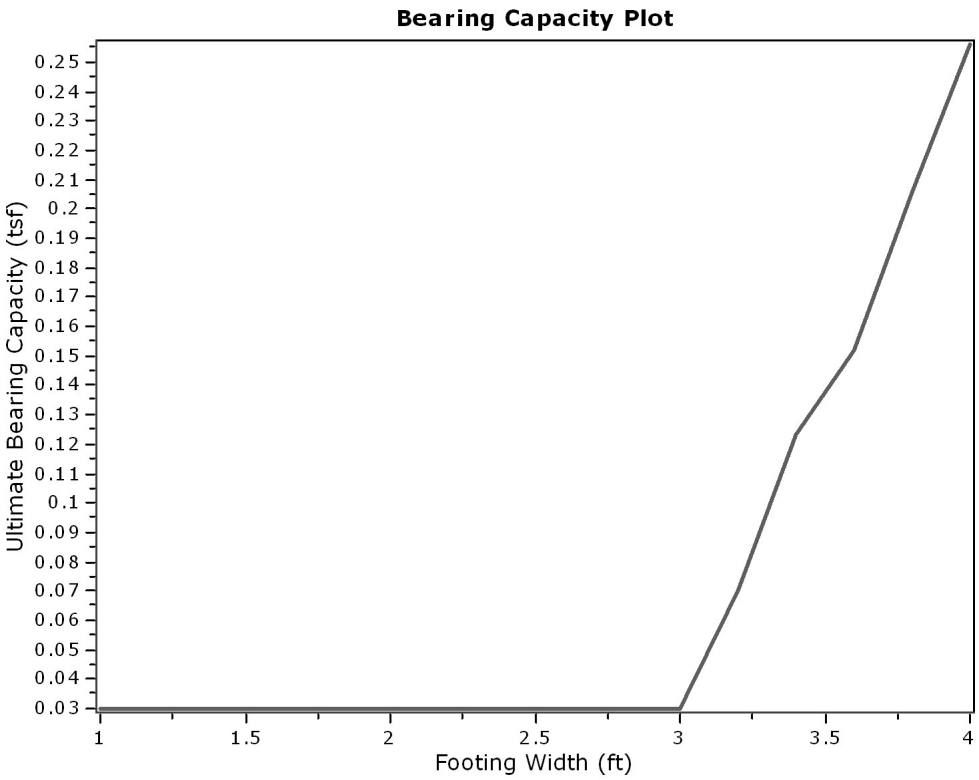
User defined estimation data



Bearing Capacity calculation is perfromed based on the formula:

$$Q_{ult} = R_k \times q_t + q_{soil}$$

where:
$R_k$: Bearing capacity factor
$q_t$: Average corrected cone resistance over calculation depth
$q_{soil}$: Pressure applied by soil above footing



**:: Tabular results ::**

Presented below is a list of formulas used for the estimation of various soil properties. The formulas are presented in SI unit system and assume that all components are expressed in the same units.

**:: Unit Weight, g (kN/m³) ::**

$$g = g_w \cdot \left( 0.27 \cdot \log(R_f) + 0.36 \cdot \log(\frac{q_t}{p_a}) + 1.236 \right)$$

where $g_w$ = water unit weight

**:: Permeability, k (m/s) ::**

$I_c < 3.27$ and $I_c > 1.00$ then $k = 10^{0.952 - 3.04 \cdot I_c}$

$I_c \leq 4.00$ and $I_c > 3.27$ then $k = 10^{-4.52 - 1.37 \cdot I_c}$

**:: $N_{SPT}$ (blows per 30 cm) ::**

$$N_{60} = \left( \frac{q_c}{P_a} \right) \cdot \frac{1}{10^{1.1268 - 0.2817 \cdot I_c}}$$

$$N_{1(60)} = Q_{tn} \cdot \frac{1}{10^{1.1268 - 0.2817 \cdot I_c}}$$

**:: Young's Modulus, Es (MPa) ::**

$$(q_t - \sigma_v) \cdot 0.015 \cdot 10^{0.55 \cdot I_c + 1.68}$$

(applicable only to $I_c < I_{c\_cutoff}$)

**:: Relative Density, Dr (%) ::**

$$100 \cdot \sqrt{\frac{Q_{tn}}{k_{DR}}}$$ (applicable only to $SBT_n$: 5, 6, 7 and 8 or $I_c < I_{c\_cutoff}$)

**:: State Parameter, ψ ::**

$$\psi = 0.56 - 0.33 \cdot \log(Q_{tn,cs})$$

**:: Drained Friction Angle, φ (°) ::**

(applicable only to $SBT_n$: 5, 6, 7 and 8 or $I_c < I_{c\_cutoff}$)

**:: 1-D constrained modulus, M (MPa) ::**

If $I_c > 2.20$
α = 14 for $Q_{tn} > 14$
α = $Q_{tn}$ for $Q_{tn} \leq 14$
$M_{CPT} = \alpha \cdot (q_t - \sigma_v)$

If $I_c \geq 2.20$

**:: Small strain shear Modulus, Go (MPa) ::**

$$G_0 = (q_t - \sigma_v) \cdot 0.0188 \cdot 10^{0.55 \cdot I_c + 1.68}$$

**:: Shear Wave Velocity, Vs (m/s) ::**

$$V_s = \left( \frac{G_0}{\rho} \right)^{0.50}$$

**:: Undrained peak shear strength, Su (kPa) ::**

$N_{kt} = 10.50 + 7 \cdot \log(F_r)$ or user defined

## Site-Specific Ground Motion Analysis

# SITE-SPECIFIC GROUND MOTION ANALYSIS

## A5.1. Introduction

This report presents the results of a site-specific seismic ground motion analysis performed by LACO Associates (LACO) for Carollo Engineers, Inc. to support design of wastewater treatment plant (WWTP) improvements at the Arcata Wastewater Treatment Plant, located at 601 South G Street, Arcata, California. Site coordinates are 40.8556°, -124.0901°.

Section 1613A of the 2016 California Building Code (CBC) mandates that structures be designed and constructed to resist earthquake damages in pursuant to ASCE 7-10 and modifications included in Section 1613 (ASCE, 2013; CBC, 2016). According to 1616A.13 ASCE 7, Section 11.4.7, buildings that are assigned to Seismic Design Category E or F require a ground motion hazard analysis in accordance with ASCE 7 Chapter 21 as modified by Section 1803A.6. Seismic Design Category E is mandated for planned structures that are classified as Risk Category III, have a characteristic mapped acceleration parameter $S_1$ greater than or equal to 0.75 times the acceleration of gravity (0.75g). Projects designated in Seismic Design Category E are not required to perform a site response analysis per Section 11.4.7 and Chapter 21 of ASCE 7-10, however this site response analysis has been prepared at the request of Carollo Engineers, Inc. Specifically, the request was for a spectra that provides *a smoothed, elastic horizontal and vertical design seismic response for the specific project site. The ground motion represented by the spectra shall be based on the geologic, tectonic, seismic recurrence information, and foundation material properties associated with the specific site. The response spectra shall consider deep foundation and the influence of foundation embedded in competent strata. The spectra shall be representative of motions which can be generated by known faults which can affect this site. The ground motion representation shall be an equal hazards spectra having a 2 percent probability of being exceeded in 50 years based on the 2016 California Building Code. Horizontal response spectra curves shall be provided for ½, 2, and 5 percent damping. A vertical response spectra curve shall be provided for 5 percent damping only. The response spectra shall have a curve extended to a period of 5 seconds for 2 and 5 percent damping and 10 seconds for ½ percent damping.*

The objective of this Section is to present the site-specific seismic response analysis and design parameters that may be used in foundation design for the wastewater treatment plant planned improvements.

## A5.2. Evaluation of Historical Seismicity

Historical earthquakes within the local region were analyzed using geospatial seismicity data obtained from the Northern California Earthquake Data Center (NCEDC, 2017). Two earthquake catalogs were used: the Berkeley Seismological Laboratory (BSL) Berkeley Digital Seismic Network (BDSN) Catalog provided earthquake data from 1910 to 2003, and the United States Geological Survey (USGS) Northern California Seismic Network (NCSN) Catalog provided data from 1967 to present.

Historic seismicity for the city of Arcata, California is presented in Figure A3-1. Earthquakes with a Richter magnitude of less than 5 were eliminated from the analysis. Site proximity to Aqluist-Priolo zones is illustrated in Figure A3-2. Nearby historic earthquake events are presented in Table A3-1.

*Table A3-1. Local Historic Seismic Events*

| Source | Magnitude | Distance (mi) | Year |
|---|---|---|---|
| Ferndale Fault | 5.3 | 23.70 | 1975 |
| Little Salmon (Offshore) | 5.2 | 12.36 | 1979 |
| Little Salmon (Offshore) | 7.2 | 31.70 | 1980 |
| Mendocino | 5.6 | 34.02 | 1987 |
| Little Salmon (Offshore) | 5.4 | 13.78 | 1994 |
| Little Salmon (Offshore) | 5.2 | 24.42 | 2002 |
| Grogan Fault | 5.4 | 31.13 | 2008 |
| Bear River Fault Zone | 6.5 | 35.00 | 2010 |
| Grogan Fault | 5.6 | 25.28 | 2012 |

Distances to site were estimated using Google™ Earth

## A5.3. Evaluation of Potential Seismic Risk

The potential seismic risk, was evaluated using EZ-FRISK™ software (Fugro, 2011). The software models seismic sources and earthquake recurrence based on the USGS source model used to update the National Seismic Hazard Maps (USGS, 2008). Specifically, earthquake ruptures are modeled using Gutenberg-Richter and characteristic magnitude-frequency distributions based on fault slip rate, geometry, dip angle, and depth. Magnitudes are modeled from previous earthquake events or from magnitude estimates (Ellsworth 2003; Hanks and Bakun 2002). Earthquake recurrence is based on earthquake rupture, magnitude estimates, and fault slip rates. Background seismicity is addressed to compensate for regions with minimal historical seismicity and is spread over the seismic model region using uniform background zones. Using EZ-FRISK™, earthquake hazard risk was evaluated for faults within a 120-mile radius of the Site. Potential sources, respective magnitudes, distances to the Site, and seismic parameters are presented in Table A3-2.

*Table A3-2. Summary of Nearby Seismic Sources*

| Source | Maximum Magnitude | Distance (km) | Site Lies | Dip Angle (degree) | Mechanism | Length (km) | Slip Rate[1] (mm/year) |
|---|---|---|---|---|---|---|---|
| Maacama-Garberville | 7.4 | 65.94 | N | 90 | Strike Slip | 221 | 9 |
| Northern San Andreas | 8.05 | 72.94 | N | 90 | Strike Slip | 325 | – |
| California Gridded | 7 | 0 | Above | 90 | SS \| R | – | – |
| Bartlett Springs | 7.3 | 82.33 | NW | 90 | Strike Slip | 174 | 6.00 |

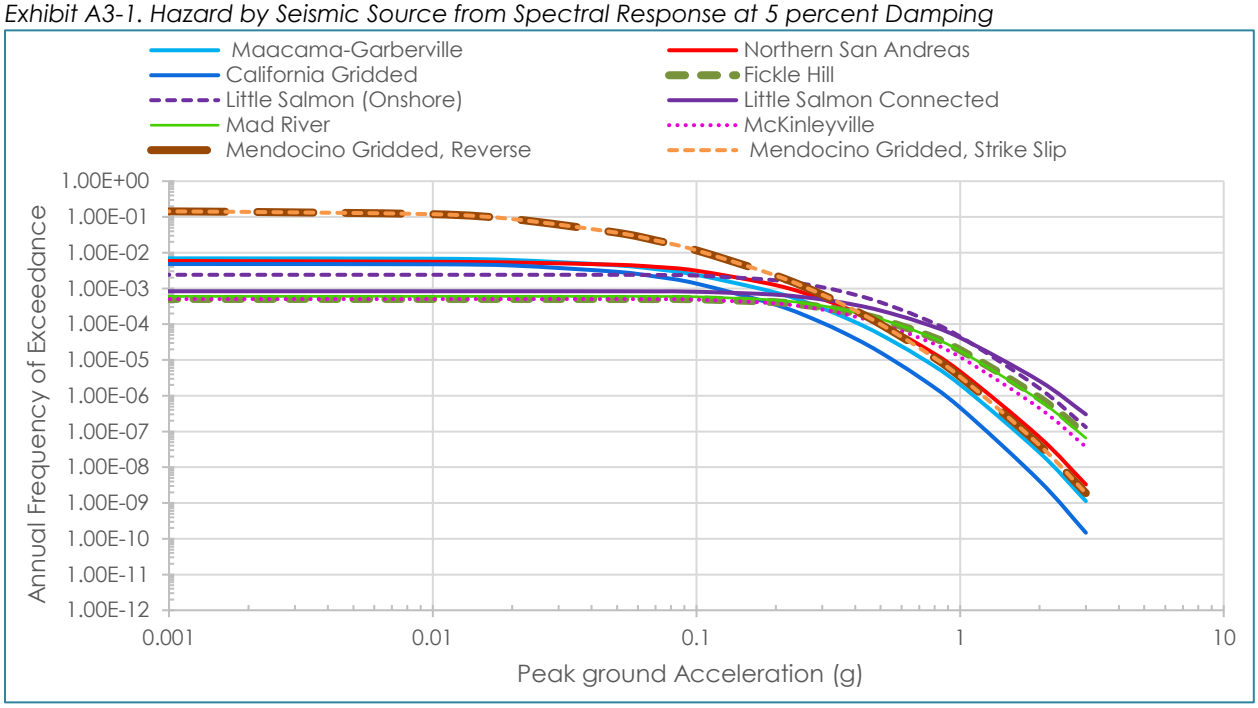
[1] Length and Slip Rate values from USGS 2008 National Seismic Hazard Maps – Source Parameters; other values from Risk Engineering, 2011. Magnitudes provided are in moment magnitude.
km–kilometer
mm–milometer
Mtn–Mountain

As shown in Table A3-2, the fault systems that demonstrate the most significant seismic hazard for the Site include Mendocino Gridded, Maacama-Garberville, Northern San Andreas, California Gridded, Little Salmon, Mad River, McKinleyville, and Fickle Hill. Peak ground accelerations (PGAs) for fault rupture at the Site, evaluated using EZ-FRISK™, are shown in Exhibit A3-1.

*Exhibit A3-1. Hazard by Seismic Source from Spectral Response at 5 percent Damping*



As shown in Exhibit A3-1, the Mendocino Gridded fault yields the highest annual frequency of exceedance, however, the Little Salmon fault yields the greatest PGA compared to the other faults. On this basis, in addition to the proximity of the Little Salmon Fault to the Site, we used the Little Salmon fault in our seismic hazard analysis.

## A5.4. Seismic Hazard Analysis

Our analysis included development of the following:

- Risk-Targeted Maximum Considered Earthquake ($MCE_R$) ground motions based on probabilistic and deterministic response spectra;
- Deterministic Lower Limit on $MCE_R$ Response Spectrum from Figure 21.2-1 of ASCE 7-10; and
- Design Response Spectrum from Figure 11.4-1 of ASCE 7-10. Design acceleration parameters are developed specifically for Site Class F based on ASCE 7-10 Section 21.4.

Earthquake intensity was calculated using the maximum rotated spectral response with 5 percent damping using the 2008 USGS fault model for California, and 2008 Next Generation Attenuation (NGA) relations (based on the 2008 USGS National Seismic Hazard Maps for the Western United States) per CBC Chapter 18A Section 1803A.6 (USGS, 2008). Three attenuation equations were utilized to provide mean values for the computed probabilistic and deterministic horizontal response spectra. These attenuation equations are by Boore and Atkinson (2008) NGA USGS 2008, Chiou and Youngs (2007) NGA USGS 2008, and Campbell and Bozorgnia (2008) NGA USGS 2008. Three attenuation equations were also utilized to provide mean values for the computed probabilistic and deterministic vertical response spectra. These attenuation equations are by Ambraseys et al (2005), Campbell and Bozorgnia (2003) uncorrolated vertical, and Sabetta and Pugliese (1996) vertical.

The NGA relations utilize the average shear wave velocity in the top 100 feet, the depths to shear wave velocities of 1,000 meters (m) ($Z_1$) and 2,500 m ($Z_{2.5}$). The average shear wave velocity is based on site-specific geotechnical data from five cone penetration tests (CPT) at the direction of a LACO geologist. CPT depths and respective shear wave velocities are presented in Table A3-3.

*Table A3-3. Geotechnical Boring Data*

| Depth Range (feet) | Shear Wave Velocity in Borings (feet per second) | | | | |
|---|---|---|---|---|---|
| | CPT1 | CPT2 | CPT3 | CPT6 | CPT9 |
| 0-5 | 300 | 300 | 350 | 350 | 315 |
| 5-10 | 300 | 300 | 350 | 350 | 315 |
| 10-15 | 400 | 420 | 400 | 400 | 390 |
| 15-20 | 500 | 420 | 480 | 450 | 500 |
| 20-25 | 400 | 420 | 400 | 450 | 400 |
| 25-30 | 400 | 420 | 400 | 450 | 400 |
| 30-35 | 450 | 540 | 550 | 450 | 430 |
| 35-40 | 520 | 540 | 650 | 600 | 510 |
| 40-45 | 600 | 750 | 750 | 600 | 580 |
| 45-50 | 650 | 850 | --- | 650 | 600 |
| 50-55 | 600 | --- | --- | --- | 600 |
| 55-60 | 600 | --- | --- | --- | 650 |

Average shear wave velocity ($V_s$) for the top 100 feet is 137 m/s (449 ft/s). It was computed using Equation A3-1 (Section 20.4 of ASCE 7-10) and individual thicknesses and shear wave velocities in Table A3-3.

$$\bar{v}_s = \frac{\sum_{i=1}^{n} d_i}{\sum_{i=1}^{n} \frac{d_i}{v_{si}}}$$ Equation A3-1

where

$\bar{v}_s$ = average shear wave velocity

$d_i$ = Thickness of layer $i$

$v_{si}$ = Average shear wave velocity in layer $i$

Accordingly, $Z_1$ was estimated at 350 m using Figure 2.5 from Abrahamson and Silva (2008) and Chiou and Youngs (2008); and $Z_{2.5}$ was set to a default value of 2 kilometers (km) based on Section 6.3.5 of Campbell and Bozorgnia (2008). Variation of $Z_{2.5}$ to 1 km and 3 km did not have an effect on probabilistic or deterministic spectral acceleration values.

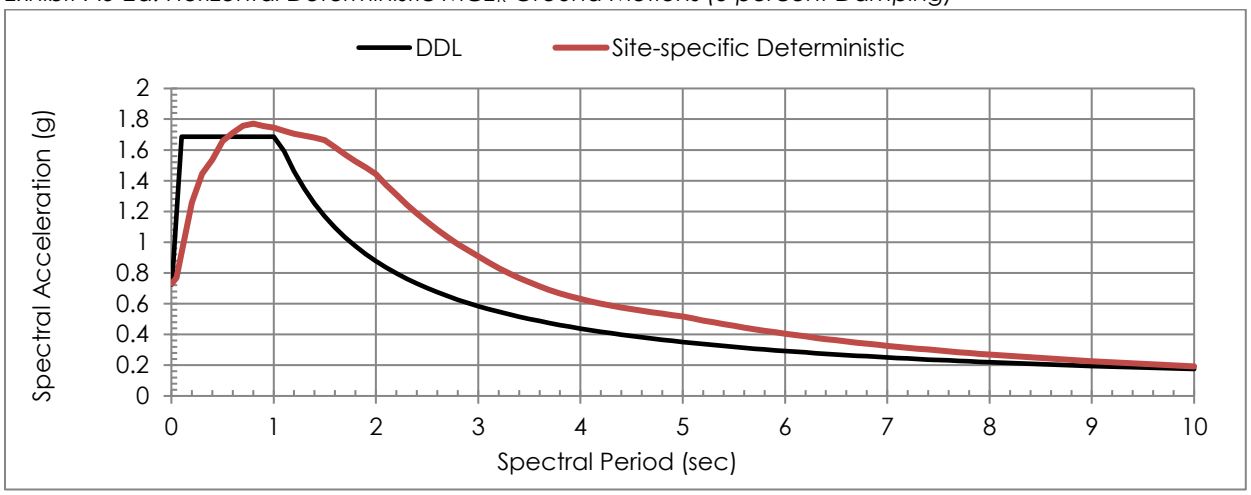
## A5.5. Results

This Section describes the seismic model results and data processing to meet the requirements of ASCE 7-10 and CBC. Site-specific characteristics, probabilistic and deterministic spectra, and design spectra are presented in this Section.

Probabilistic spectra was computed using a probability of exceedance of 2 percent in 50 years (a return period of 2,475 years) in accordance with Method 1 described in 21.2 of ASCE 7-10. The probabilistic analysis

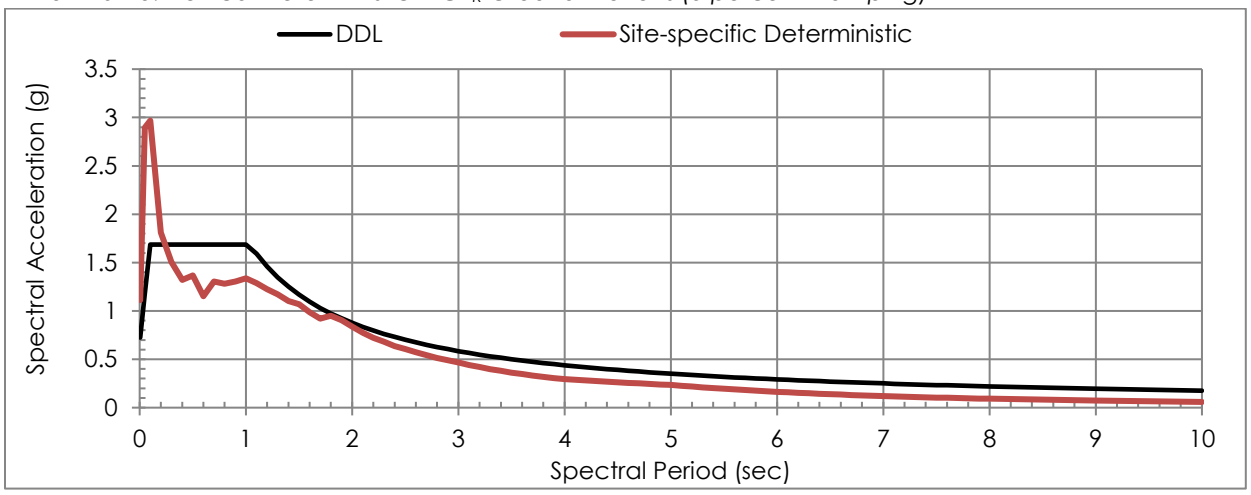
included seismic sources within a 200 km radius of the Site (the greatest contributors are illustrated in Table A3-2). Deterministic spectra were computed using the 84th percentile of spectral accelerations based on ASCE 7-10 requirements from Section 21.2.1.2. The deterministic analysis included the Little Salmon seismic source (located approximately 11 miles southwest of the Site). Probabilistic and deterministic spectra presented in these results utilize 5 percent damping. The resulting site-specific deterministic spectra was compared to the deterministic lower limit (DDL) described in Figure 21.2-1 of ASCE 7-10. The results for horizontal deterministic $MCE_R$ ground motions are presented in Exhibit A3-2a and the results for vertical deterministic $MCE_R$ ground motions are presented in Exhibit A3-2b. The DDL is used to provide a lower bound on computed spectra to ensure that designs based on deterministic spectra are sufficiently conservative.

*Exhibit A3-2a. Horizontal Deterministic $MCE_R$ Ground Motions (5 percent Damping)*



As shown in Exhibit A3-2a, site-specific deterministic spectra are greater than the DDL spectra for periods greater than 0.5 seconds, but the DDL is greater than site-specific deterministic spectra for periods less than 0.5 seconds. Therefore, the site-specific deterministic spectra require adjustment to include the DDL values according to ASCE 7-10 Section 21.2.2.

*Exhibit A3-2b. Vertical Deterministic $MCE_R$ Ground Motions (5 percent Damping)*

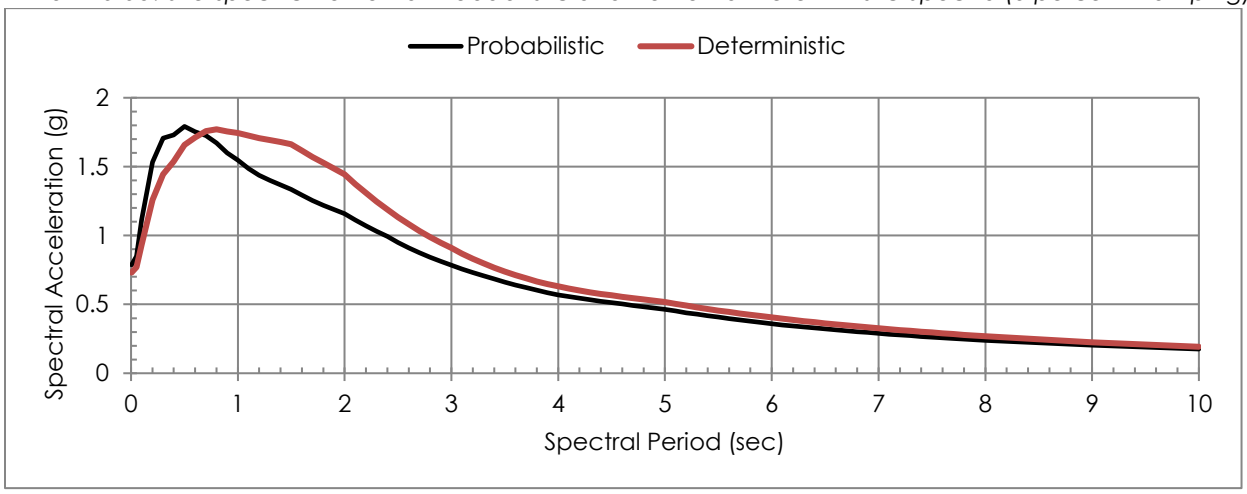


As illustrated in Exhibit A3-2b, site-specific deterministic spectra are greater than the DDL spectra for periods less than 0.2 seconds, but the DDL is greater than site-specific deterministic spectra for periods greater than 0.2 seconds. Therefore, the site-specific deterministic spectra require adjustment to include the DDL values according to ASCE 7-10 Section 21.2.2.

The lesser of the probabilistic and deterministic response spectra establishes the site-specific $MCE_R$ response based on ASCE 7-10 Section 21.2.3. Horizontal probabilistic and deterministic spectra and vertical probabilistic and deterministic spectra are compared in Exhibit A3-3a and A3-3b, respectively.

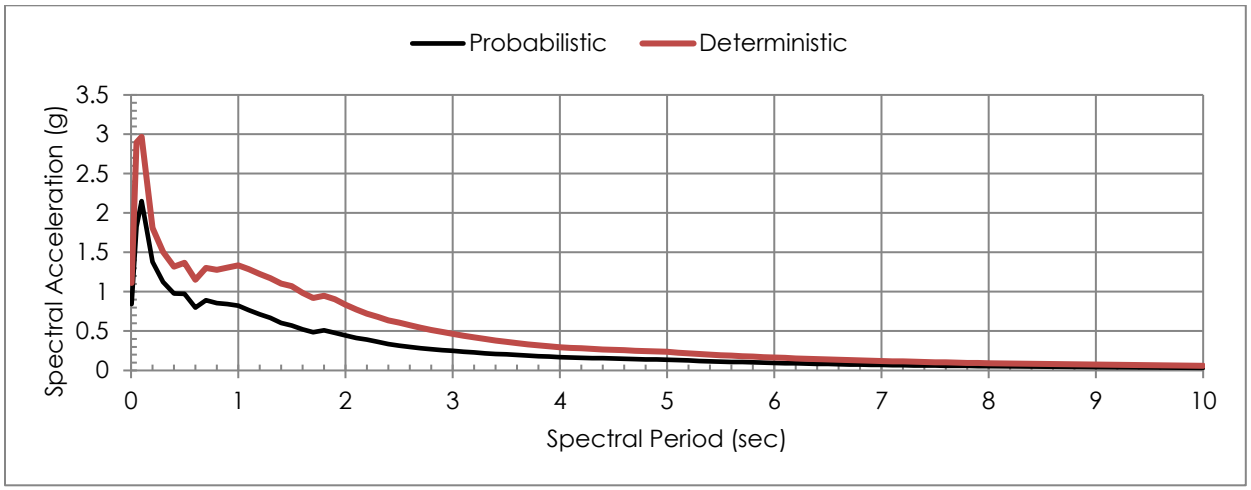
Both of the horizontal probabilistic and horizontal deterministic spectra are in the direction of the maximum horizontal response. Both of the vertical probabilistic and vertical deterministic spectra are in the direction of the maximum vertical response. In addition, mapped risk coefficients $C_{RS}$ and $C_{R1}$ were used to adjust the probabilistic spectral response spectra based on the requirements in ASCE 7-10 Section 21.2.1.1. The value for $C_{RS}$ and $C_{R1}$ are 0.894 and 0.886, respectively, are based on the U.S. Seismic Design Maps (USGS, 2017).

*Exhibit A3-3a. Site-specific Horizontal Probabilistic and Horizontal Deterministic Spectra (5 percent Damping)*



As shown in Exhibit A3-3a, the probabilistic spectra are higher than the deterministic spectra for the periods less than 0.7 seconds, but the probabilistic spectra are lower than the deterministic spectra for the periods greater than 0.7 seconds and are therefore modified to include the component of the deterministic spectra based on ASCE 7-10 Section 21.2.3.

*Exhibit A3-3b. Site-specific Vertical Probabilistic and Vertical Deterministic Spectra (5 percent Damping)*

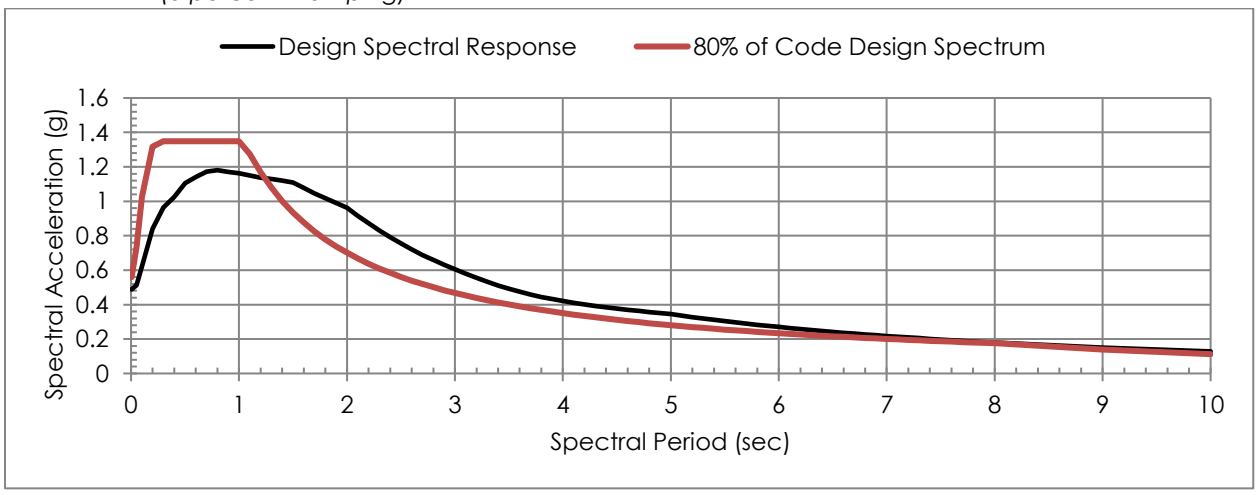


As shown in Exhibit A3-3b, the probabilistic spectra are lower than the deterministic spectra and are therefore the controlling site-specific spectra based on ASCE 7-10 Section 21.2.3.

The design spectral response acceleration is calculated as two-thirds of the controlling site-specific spectra based on ASCE 7-10 Section 21.3. ASCE 7-10 mandates that the design spectral response be greater than 80 percent of the code design spectra developed using the methods in ASCE 7-10 Section 11.4.5. Site Class E was selected based on the average shear wave velocity from the CPT logs. Therefore, Site Class E tabular values for site coefficients $F_a$ and $F_v$ were used to develop the code design spectra.

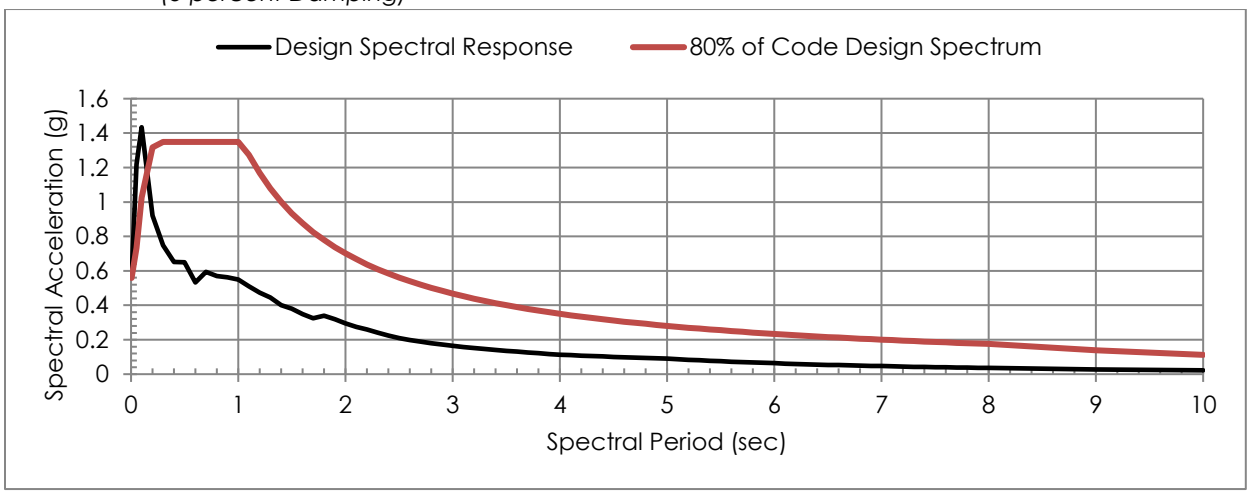
The final design spectra was obtained by taking the maximum value of the design spectral response and 80 percent of code design spectra based on the requirements in ASCE 7-10 Section 21.3. The two horizontal spectra are compared in Exhibit A3-4a and the two vertical spectra are compared in Exhibit A3-4b.

*Exhibit A3-4a. Horizontal Design Spectral Response and 80 percent of Code Design Spectrum (5 percent Damping)*



The horizontal design spectral response are not higher than 80 percent of code design spectra, and are therefore modified to include the component of 80 percent of code design spectra.

*Exhibit A3-4b. Vertical Design Spectral Response and 80 percent of Code Design Spectrum (5 percent Damping)*



The vertical design spectral response are not higher than 80 percent of code design spectra, and are therefore modified to include the component of 80 percent of code design spectra.

The $MCE_R$ response spectrum is created by multiplying the modified design spectra by 1.5 based on ASCE 7-10 Section 11.4.6.

The horizontal design spectrum results for 5 percent dampening are presented in Exhibit A3-5a. Both the horizontal $MCE_R$ and horizontal design spectrum contain the influences of the 80 percent of code design spectra value near the spectral period of 2.0 seconds based on the requirements in ASCE 7-10 Section 21.3. The horizontal $MCE_R$ and horizontal design spectrum are tabulated in Table A3-4.

*Exhibit A3-5a. Horizontal $MCE_R$ and Horizontal Design Spectrum (5 percent Damping)*

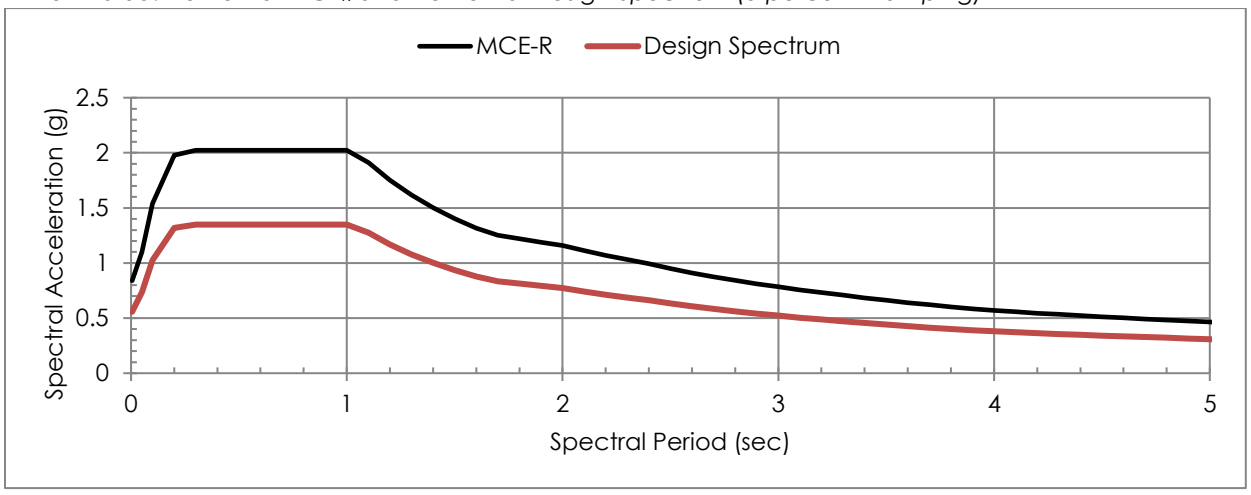


*Table A3-4a. Horizontal* $MCE_R$ Spectrum and Horizontal Design Spectrum

| Period (sec) | $MCE_R$ Spectrum | Design Spectrum |
|---|---|---|
| PGA (0.005) | 0.8384 | 0.5590 |
| 0.1 | 1.5389 | 1.0260 |
| 0.2 | 1.9768 | 1.3179 |
| 0.4 | 2.0232 | 1.3488 |
| 0.6 | 2.0232 | 1.3488 |
| 0.8 | 2.0232 | 1.3488 |
| 1.0 | 2.0232 | 1.3488 |
| 2.0 | 1.158 | 0.7720 |
| 3.0 | 0.7839 | 0.5226 |
| 4.0 | 0.5693 | 0.3795 |

Horizontal response spectra curves for 1/2 percent, and 2 percent dampening based off of the horizontal $MCE_R$ and horizontal design spectrum are presented below in Exhibit A3-5b, and A3-5c.

*Exhibit A3-5b. Horizontal Response Spectra for ½ percent Damping*

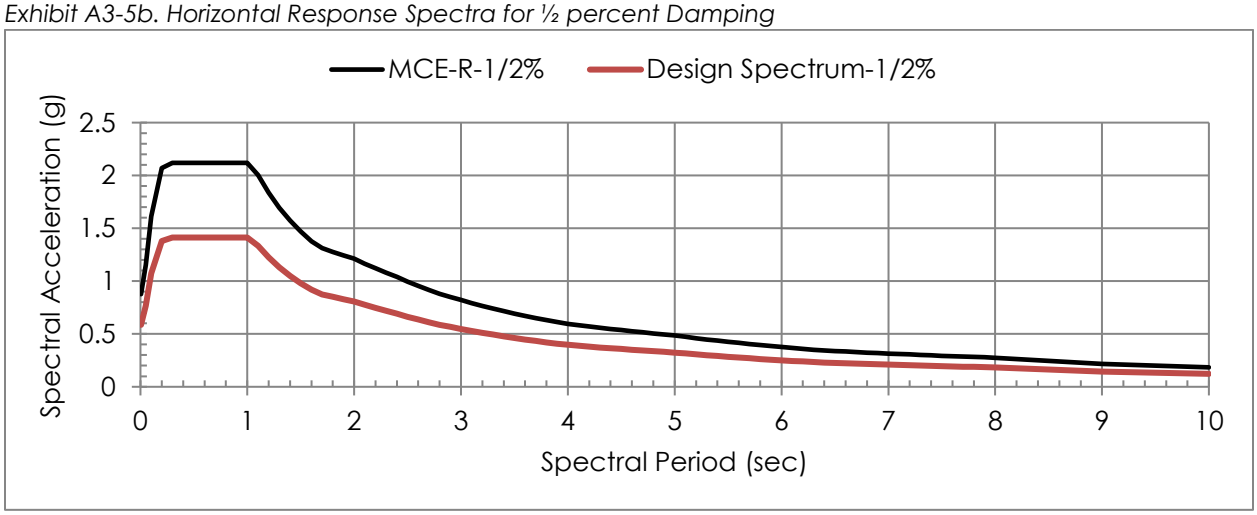

*Exhibit A3-5c. Horizontal Response Spectra for 2 percent Damping*

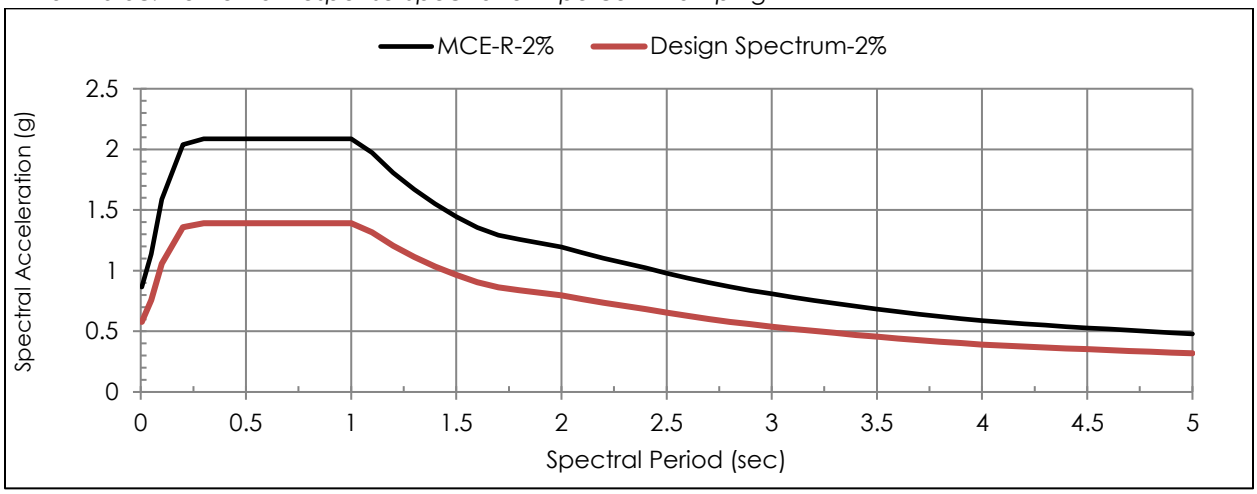

The vertical design spectrum results for 5 percent dampening are presented in Exhibit A3-6. Both the vertical $MCE_R$ and vertical design spectrum contain the influences of the 80 percent of code design spectra value near the spectral period of 2.0 seconds based on the requirements in ASCE 7-10 Section 21.3. The vertical $MCE_R$ and vertical design spectrum are tabulated in Table A3-4b.

*Exhibit A3-6. Vertical $MCE_R$ and Design Spectrum*, 5 percent damping

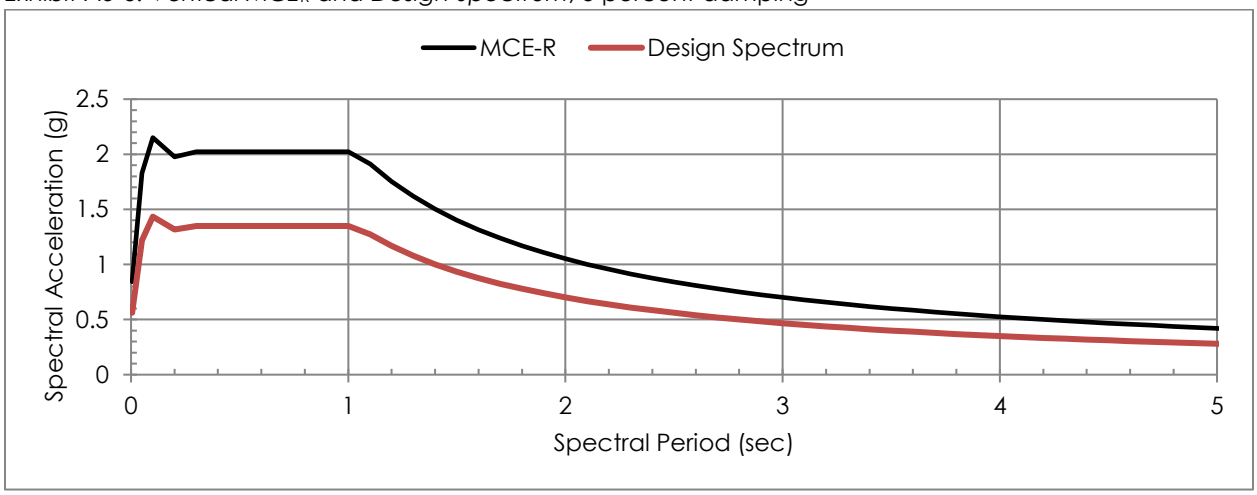

*Table A3-4b. Vertical* $MCE_R$ Spectrum and Vertical Design Spectrum

| Period (sec) | $MCE_R$ Spectrum | Design Spectrum |
|---|---|---|
| PGA (0.005) | 0.8432 | 0.5621 |
| 0.1 | 2.151 | 1.4340 |
| 0.2 | 1.9768 | 1.3179 |
| 0.4 | 2.0232 | 1.3488 |
| 0.6 | 2.0232 | 1.3488 |
| 0.8 | 2.0232 | 1.3488 |
| 1.0 | 2.0232 | 1.3488 |
| 2.0 | 1.0518 | 0.7012 |
| 3.0 | 0.7012 | 0.4675 |
| 4.0 | 0.5259 | 0.3506 |

## A5.6. Seismic Design Parameters

Based on the results of our ground motion analysis, we recommend using the seismic design factors presented in Table A3-5.

*Table A3-5. Summary of Seismic Design Factors per ASCE 21.4: Design Acceleration Parameters*

| | $S_{MS}$ (g) | $S_{M1}$ (g) | $S_{DS}$ (g) | $S_{D1}$ (g) |
|---|---|---|---|---|
| Horizontal | 2.0232 | 2.3160 | 1.3488 | 1.5440 |
| Vertical | 2.0232 | 2.1036 | 1.3488 | 1.4024 |

(g) acceleration of gravity

where

$S_{MS}$ = Maximum considered earthquake spectral response acceleration, 5 percent damped, at 0.2 second (in percent g).

$S_{M1}$ = Maximum considered earthquake spectral response acceleration, 5 percent damped, at 1.0 second period (in percent g).

$S_{DS}$ = Design spectral response acceleration, 5 percent damped, at 0.2 second period (in percent g).

$S_{D1}$ = Design spectral response acceleration, 5 percent damped, at 1.0 second period (in percent g).

Peak ground accelerations were computed for the geometric mean horizontal component of the spectral response per ASCE 7-10 Section 11.8.3 and are summarized in Table A3-7.

*Table A3-7.* $MCE_G$ *(g) Peak Ground Acceleration Adjusted for Site Class Effects*

| Intensity Type | Probabilistic | Deterministic | 80 percent of Equation 11.8-1 |
|---|---|---|---|
| Geometric Mean Horizontal Component of Spectral Response | 0.61 | 0.56 | 0.81 |

Based on ASCE 7-10 Section 21.5.3, the site-specific $MCE_G$ peak ground acceleration should be taken as the lesser of the probabilistic or deterministic geometric mean peak ground acceleration, but shall not be taken

less than 80% of $PGA_M$ determined from Equation 11.8-1. Use the deterministic value of 0.81g from the geometric mean horizontal component for $MCE_G$ (PGA) and an earthquake magnitude of M7.3, located 4.23 miles from Site, for design.

# APPENDIX 6

## Liquefaction Assessment Results by use of SPT Data

GEOLOGISMIKI Geotechnical Software

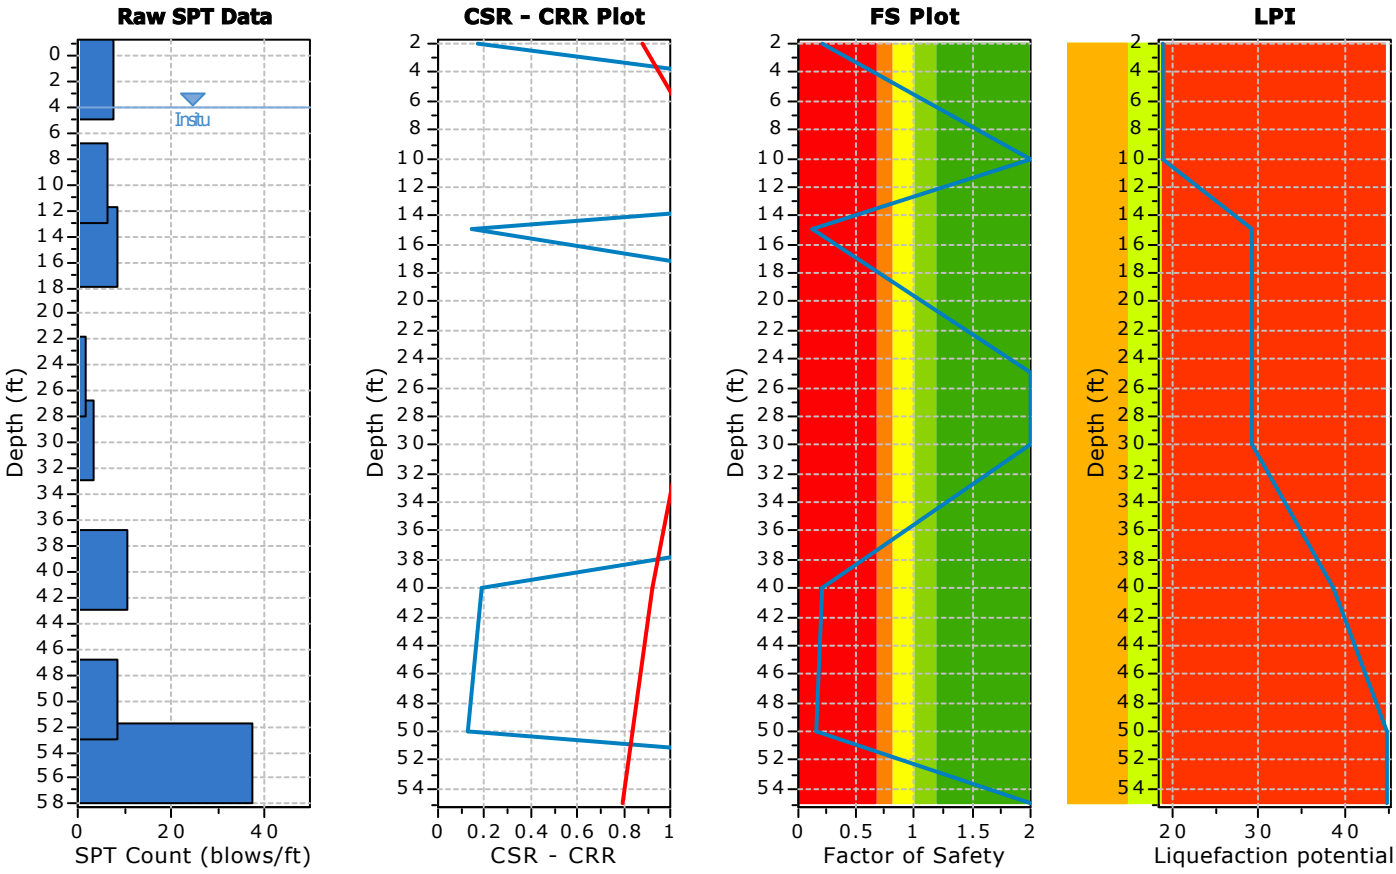
# SPT BASED LIQUEFACTION ANALYSIS REPORT

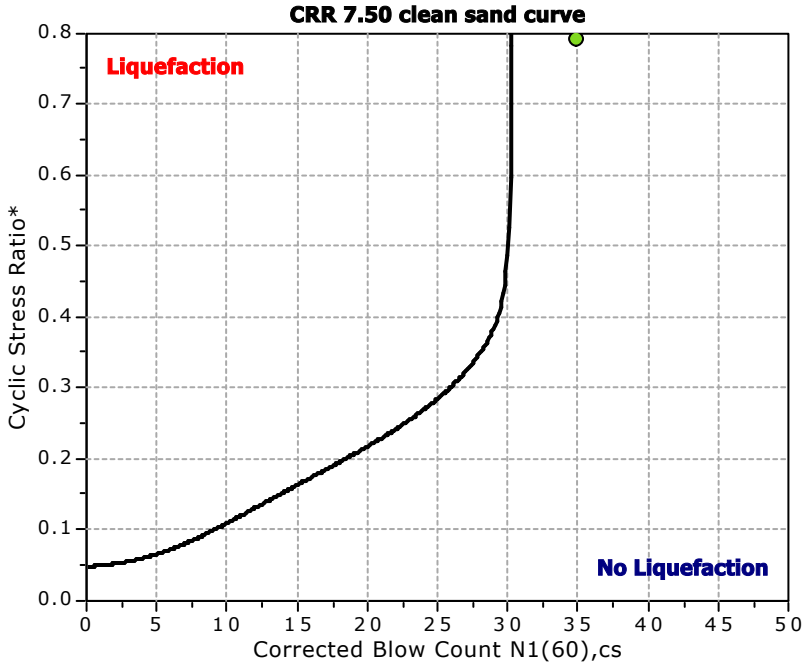
**Project title : Arcata Wastewater Treatment Facility Improvements Project** **SPT Name: GBH-2**

**Location : 736 F Street, Arcata, California**

**:: Input parameters and analysis properties ::**

| | | | |
|---|---|---|---|
| Analysis method: | NCEER 1998 | G.W.T. (in-situ): | 4.00 ft |
| Fines correction method: | NCEER 1998 | G.W.T. (earthq.): | 0.00 ft |
| Sampling method: | Standard Sampler | Earthquake magnitude $M_w$: | 7.30 |
| Borehole diameter: | 65mm to 115mm | Peak ground acceleration: | 0.81 g |
| Rod length: | 3.30 ft | Eq. external load: | 0.00 tsf |
| Hammer energy ratio: | 1.00 | | |





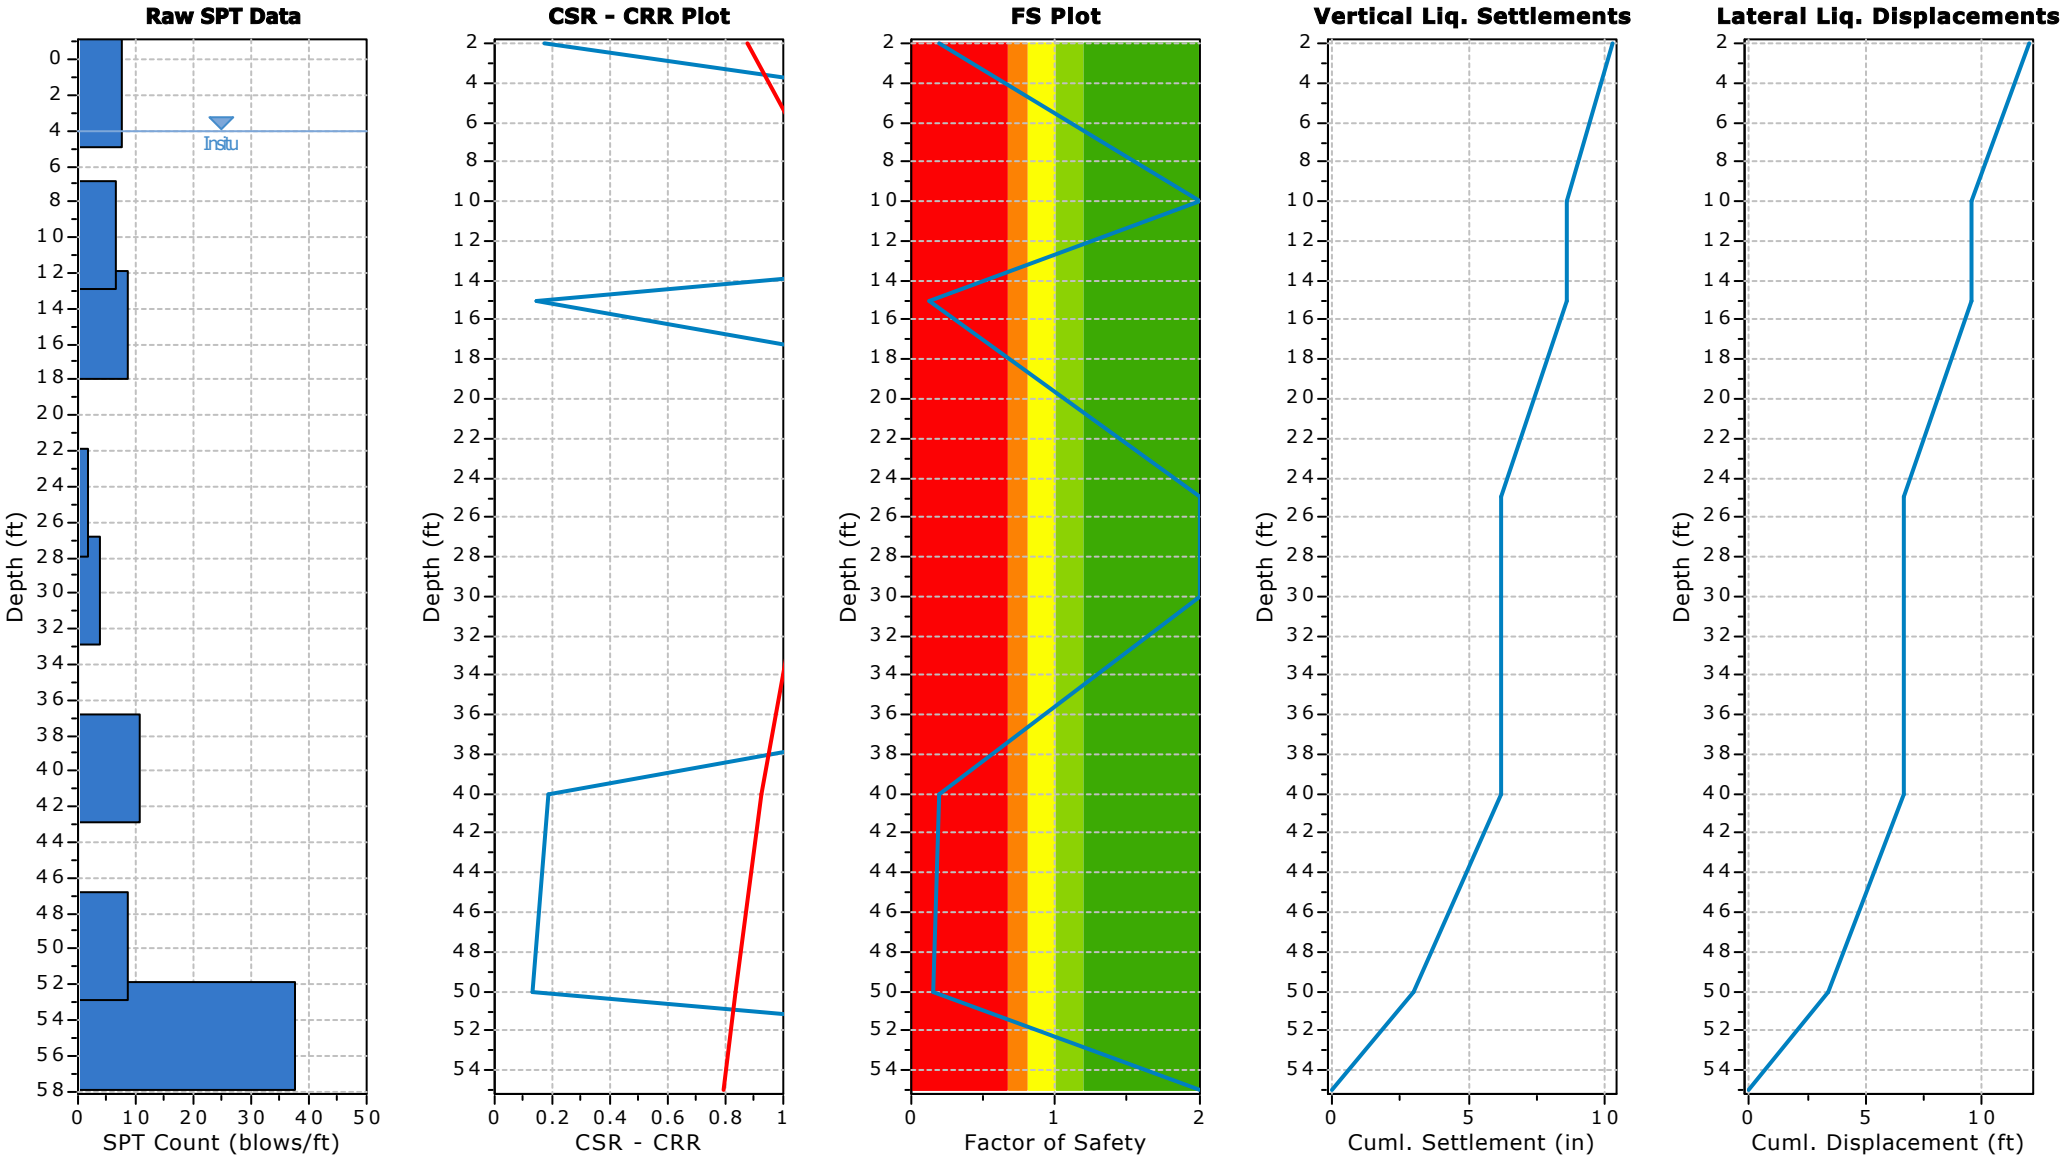
**F.S. color scheme**

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

**LPI color scheme**

- Very high risk
- High risk
- Low risk

## :: Overall Liquefaction Assessment Analysis Plots ::



**:: Field input data ::**

| Test Depth (ft) | SPT Field Value (blows) | Fines Content (%) | Unit Weight (pcf) | Infl. Thickness (ft) | Can Liquefy |
|---|---|---|---|---|---|
| 2.00 | 8 | 28.00 | 141.00 | 5.00 | Yes |
| 10.00 | 7 | 89.00 | 97.00 | 10.00 | No |
| 15.00 | 9 | 14.00 | 112.00 | 6.00 | Yes |
| 25.00 | 2 | 93.30 | 112.00 | 7.00 | No |
| 30.00 | 4 | 93.30 | 112.00 | 7.00 | No |
| 40.00 | 11 | 30.00 | 125.00 | 10.00 | Yes |
| 50.00 | 9 | 18.00 | 127.00 | 7.00 | Yes |
| 55.00 | 38 | 18.00 | 127.00 | 3.50 | Yes |

**Abbreviations**

Depth: Depth at which test was performed (ft)
SPT Field Value: Number of blows per foot
Fines Content: Fines content at test depth (%)
Unit Weight: Unit weight at test depth (pcf)
Infl. Thickness: Thickness of the soil layer to be considered in settlements analysis (ft)
Can Liquefy: User defined switch for excluding/including test depth from the analysis procedure

GEOLOGISMIKI Geotechnical Software

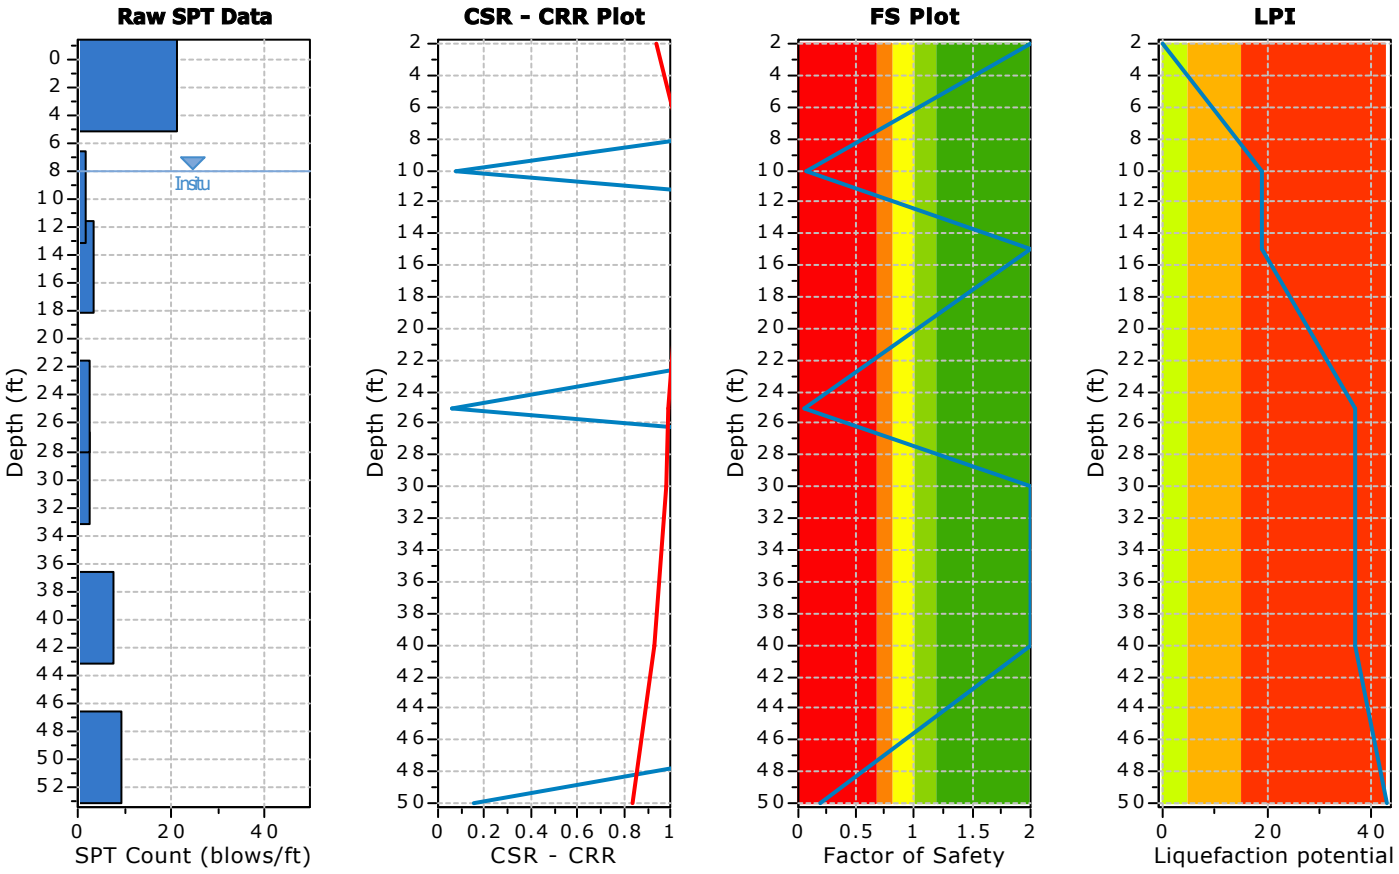
# SPT BASED LIQUEFACTION ANALYSIS REPORT

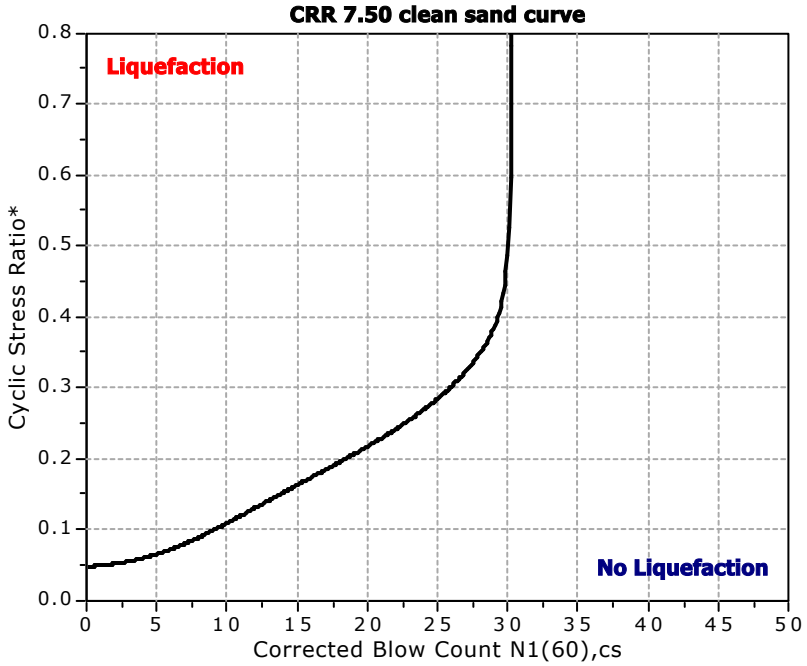
**Project title : Arcata Wastewater Treatment Facility Improvements Project** **SPT Name: GBH-5**

**Location : 736 F Street, Arcata, California**

**:: Input parameters and analysis properties ::**

| | | | |
|---|---|---|---|
| Analysis method: | NCEER 1998 | G.W.T. (in-situ): | 8.00 ft |
| Fines correction method: | NCEER 1998 | G.W.T. (earthq.): | 0.00 ft |
| Sampling method: | Standard Sampler | Earthquake magnitude $M_w$: | 7.30 |
| Borehole diameter: | 65mm to 115mm | Peak ground acceleration: | 0.81 g |
| Rod length: | 3.30 ft | Eq. external load: | 0.00 tsf |
| Hammer energy ratio: | 1.00 | | |





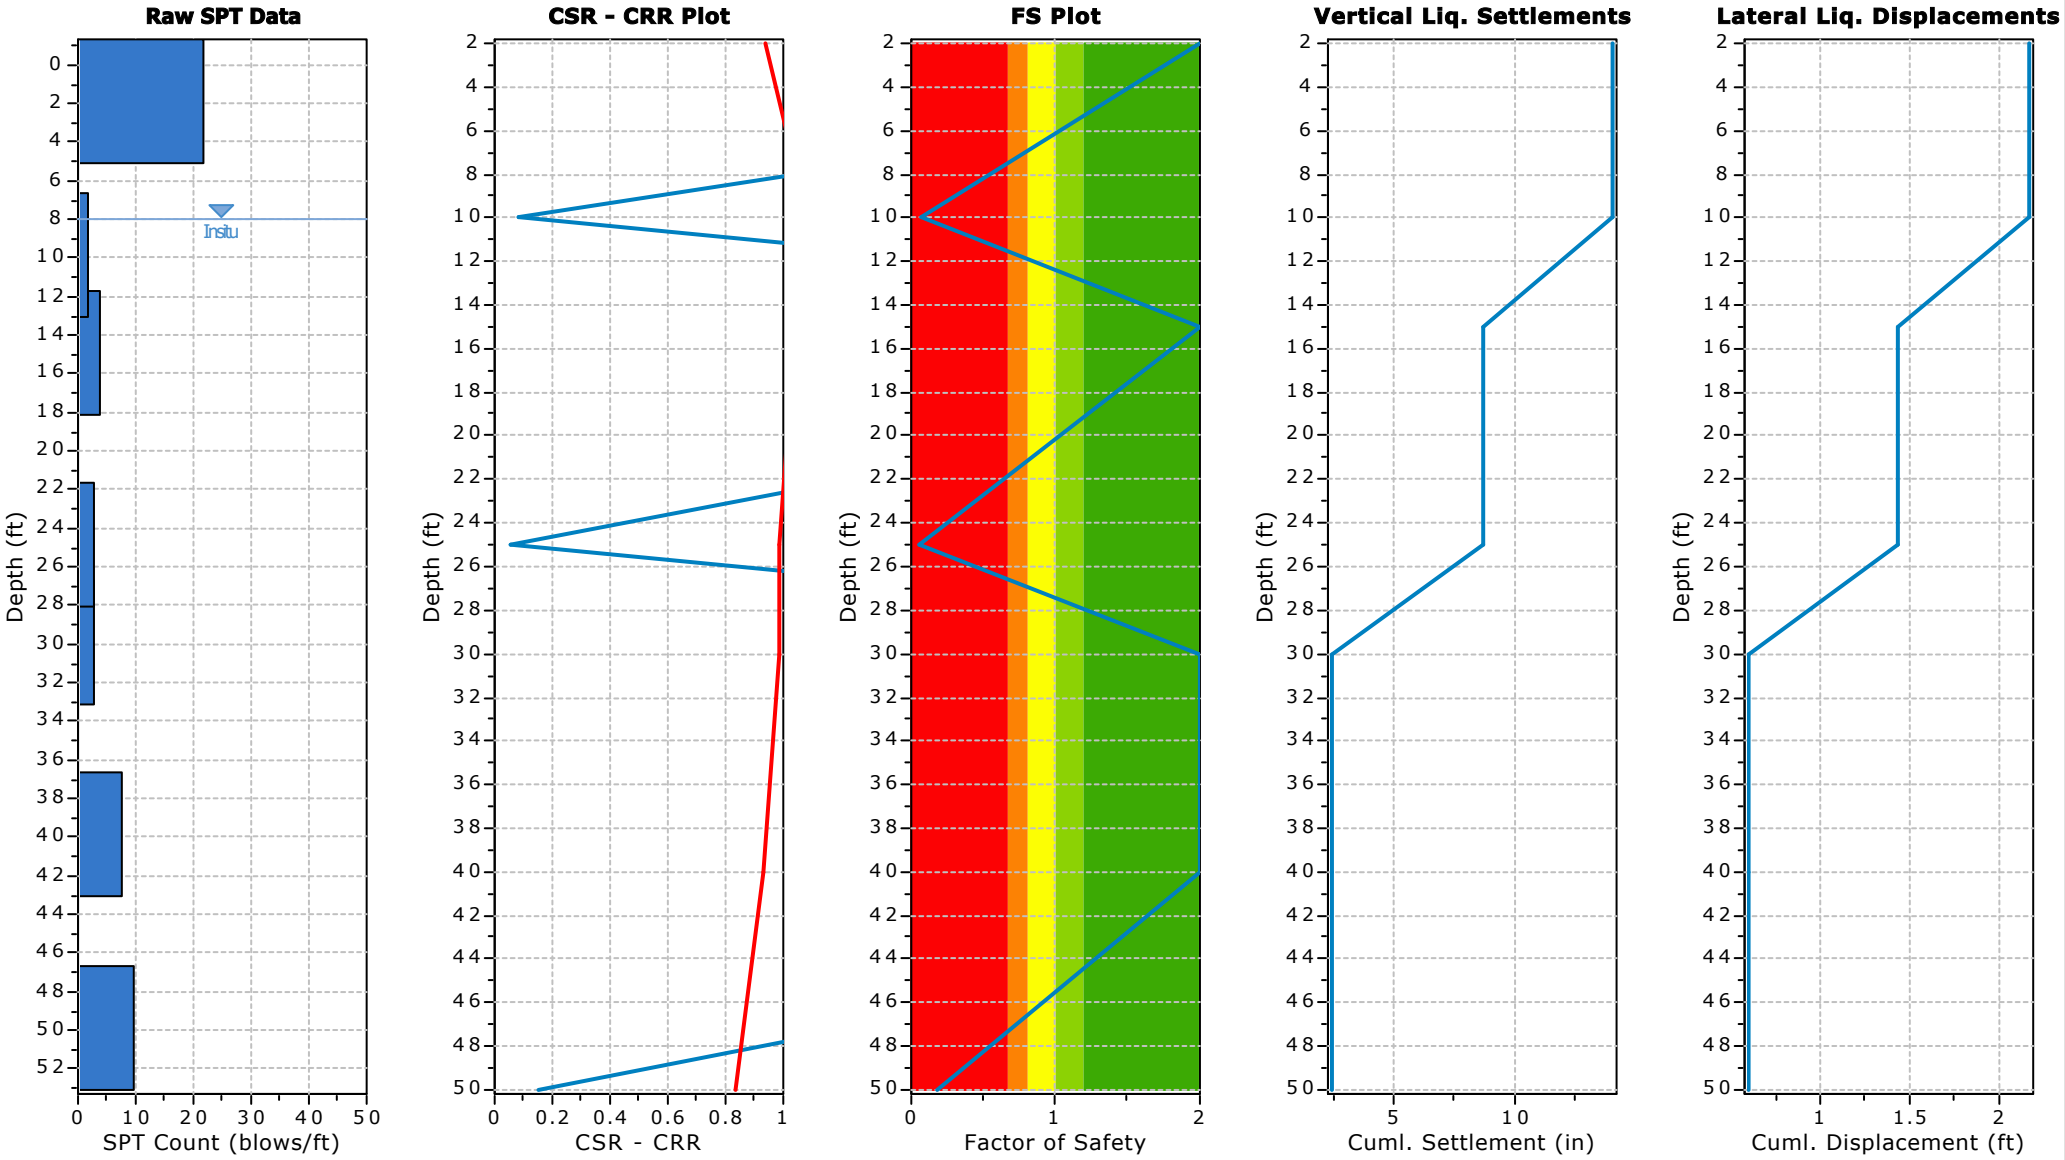
**F.S. color scheme**

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

**LPI color scheme**

- Very high risk
- High risk
- Low risk

## :: Overall Liquefaction Assessment Analysis Plots ::



**:: Field input data ::**

| Test Depth (ft) | SPT Field Value (blows) | Fines Content (%) | Unit Weight (pcf) | Infl. Thickness (ft) | Can Liquefy |
|---|---|---|---|---|---|
| 2.00 | 22 | 28.00 | 131.00 | 5.00 | Yes |
| 10.00 | 2 | 95.00 | 108.00 | 8.00 | Yes |
| 15.00 | 4 | 97.50 | 120.00 | 8.00 | No |
| 25.00 | 3 | 7.10 | 121.00 | 9.00 | Yes |
| 30.00 | 3 | 95.50 | 104.00 | 5.00 | No |
| 40.00 | 8 | 90.00 | 108.00 | 10.00 | No |
| 50.00 | 10 | 30.00 | 129.00 | 6.50 | Yes |

**Abbreviations**

Depth: Depth at which test was performed (ft)
SPT Field Value: Number of blows per foot
Fines Content: Fines content at test depth (%)
Unit Weight: Unit weight at test depth (pcf)
Infl. Thickness: Thickness of the soil layer to be considered in settlements analysis (ft)
Can Liquefy: User defined switch for excluding/including test depth from the analysis procedure

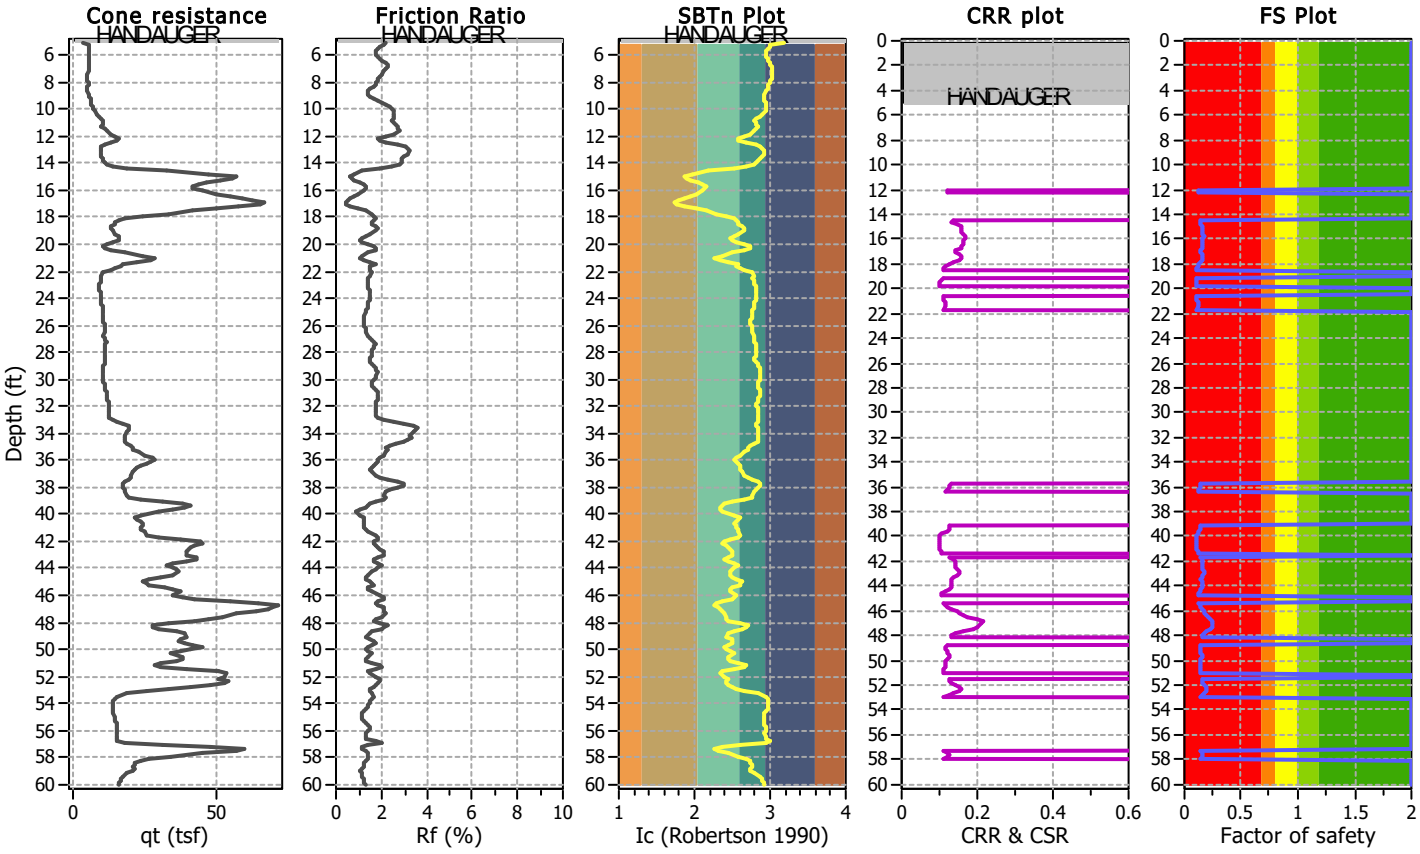
# LIQUEFACTION ANALYSIS REPORT

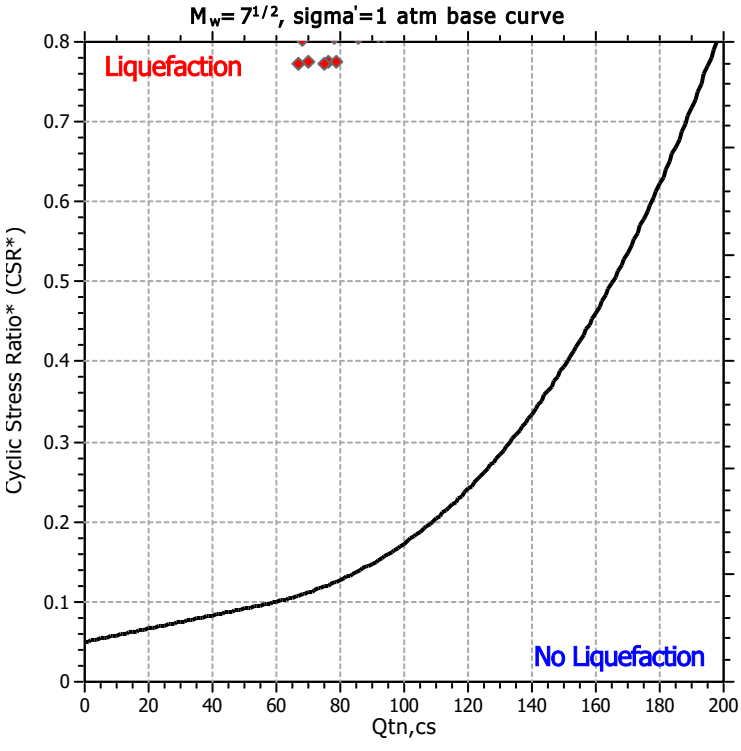
**Project title : AWWTF Improvements Project** **Location : 736 F Street, Arcata, California**

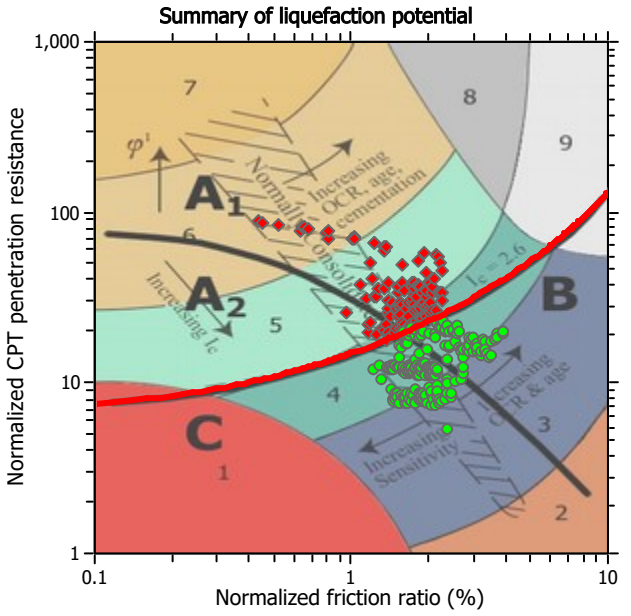
**CPT file : CPT-1**

**Input parameters and analysis data**

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| **Analysis method:** | **NCEER (1998)** | **G.W.T. (in-situ):** | **5.00 ft** | **Use fill:** | **Yes** | **Clay like behavior applied:** | **Sands only** |
| **Fines correction method:** | **NCEER (1998)** | **G.W.T. (earthq.):** | **0.00 ft** | **Fill height:** | **5.00 ft** | **Limit depth applie:** | **No** |
| **Points to test:** | **Based on Ic value** | **Average results interv:** | **3** | **Fill weight:** | **141.00 lb/ft³** | **Limit depth:** | **N/A** |
| **Earthquake magnitude $M_w$:** | **7.30** | **Ic cut-off value:** | **2.60** | **Trans. detect. applied:** | **No** | **MSF method:** | **Method based** |
| **Peak ground acceleration:** | **0.81** | **Unit weight calculatior** | **Based on SBT** | **$K_o$ applied:** | **Yes** | | |

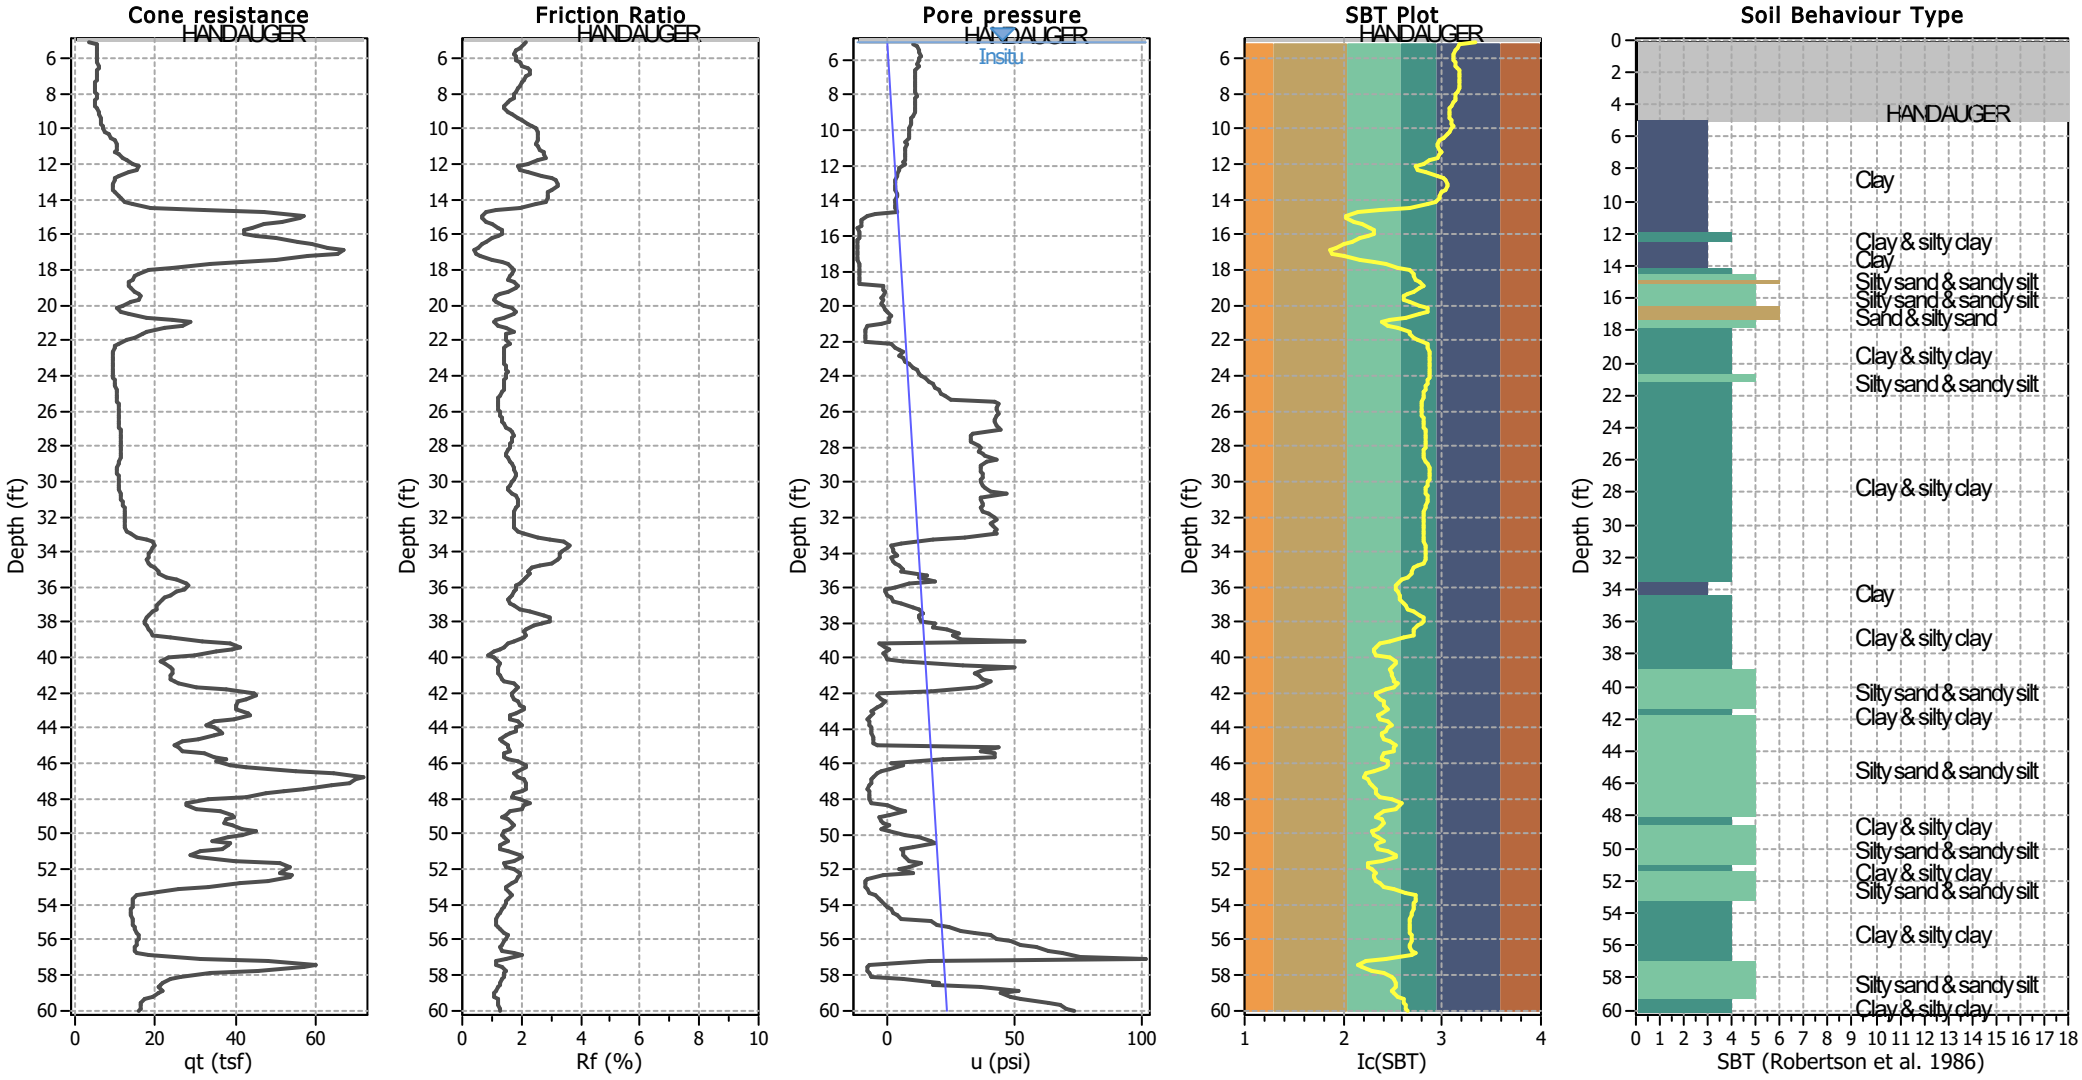






Zone $A_1$: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone $A_2$: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

# CPT basic interpretation plots



## Input parameters and analysis data

| | | | | | |
|---|---|---|---|---|---|
| Analysis method: | NCEER (1998) | Depth to water table (erthq.): | 0.00 ft | Fill weight: | 141.00 lb/ft³ |
| Fines correction method: | NCEER (1998) | Average results interval: | 3 | Transition detect. applied: | No |
| Points to test: | Based on Ic value | Ic cut-off value: | 2.60 | $K_\sigma$ applied: | Yes |
| Earthquake magnitude $M_w$: | 7.30 | Unit weight calculation: | Based on SBT | Clay like behavior applied: | Sands only |
| Peak ground acceleration: | 0.81 | Use fill: | Yes | Limit depth applied: | No |
| Depth to water table (insitu): | 5.00 ft | Fill height: | 5.00 ft | Limit depth: | N/A |

**SBT legend**

1. Sensitive fine grained
2. Organic material
3. Clay to silty clay
4. Clayey silt to silty
5. Silty sand to sandy silt
6. Clean sand to silty sand
7. Gravely sand to sand
8. Very stiff sand to
9. Very stiff fine grained

## CPT basic interpretation plots (normalized)

| Depth to water table (insitu): | 5.00 ft | Fill height: | 5.00 ft | Limit depth: | N/A |

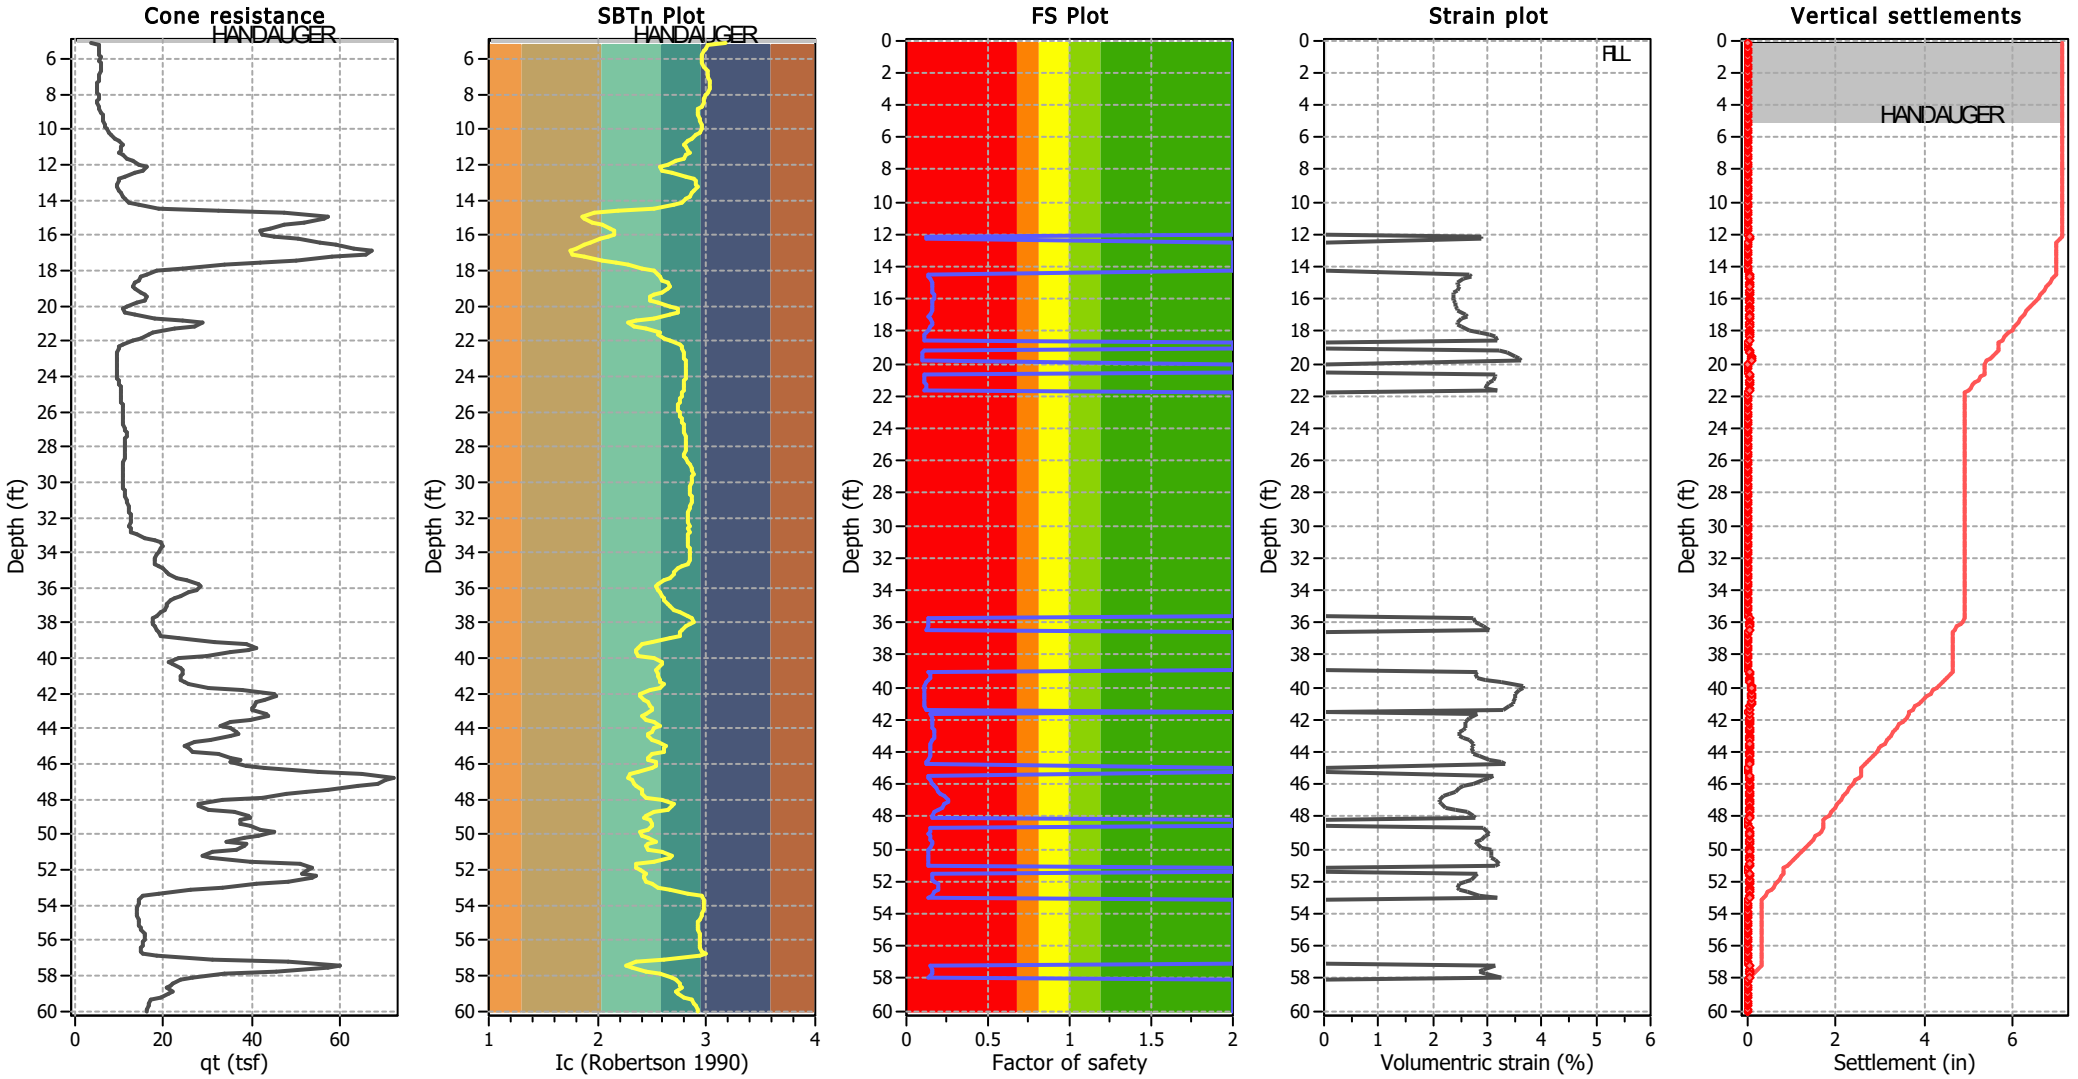
## Estimation of post-earthquake settlements

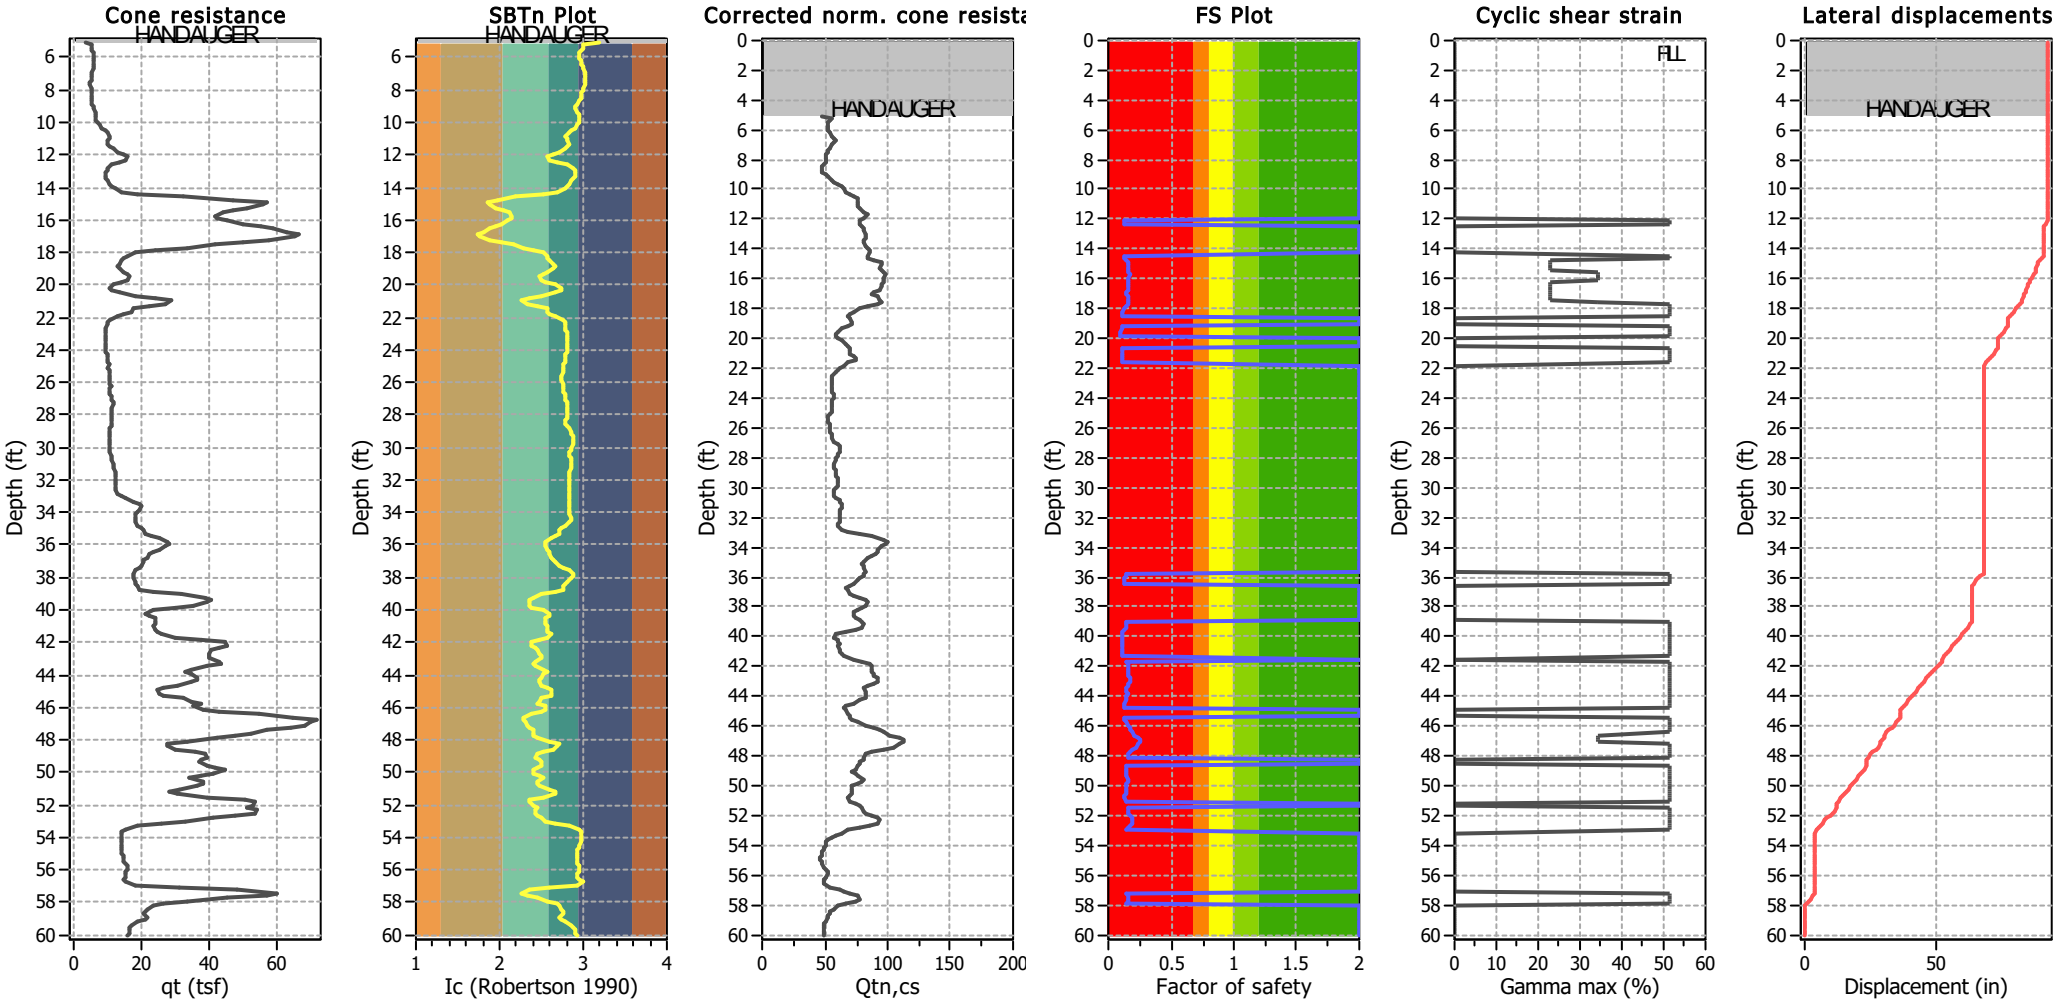


**Abbreviations**

| | |
|---|---|
| $q_t$: | Total cone resistance (cone resistance $q_c$ corrected for pore water effects) |
| $I_c$: | Soil Behaviour Type Index |
| FS: | Calculated Factor of Safety against liquefaction |
| Volumentric strain: | Post-liquefaction volumentric strain |

## Estimation of post-earthquake lateral Displacements

**Geometric parameters: Level ground (or gently sloping) with free face (L: 63.00 ft - H: 5.00 ft)**



**Abbreviations**

$q_t$: Total cone resistance (cone resistance $q_c$ corrected for pore water effects)
$I_c$: Soil Behaviour Type Index
$Q_{tn,cs}$: Equivalent clean sand normalized CPT total cone resistance
F.S.: Factor of safety
$\gamma_{max}$: Maximum cyclic shear strain
LDI: Lateral displacement index

**Surface condition**

| Depth to water table (insitu): | 5.00 ft | Fill height: | 5.00 ft | Limit depth: | N/A |

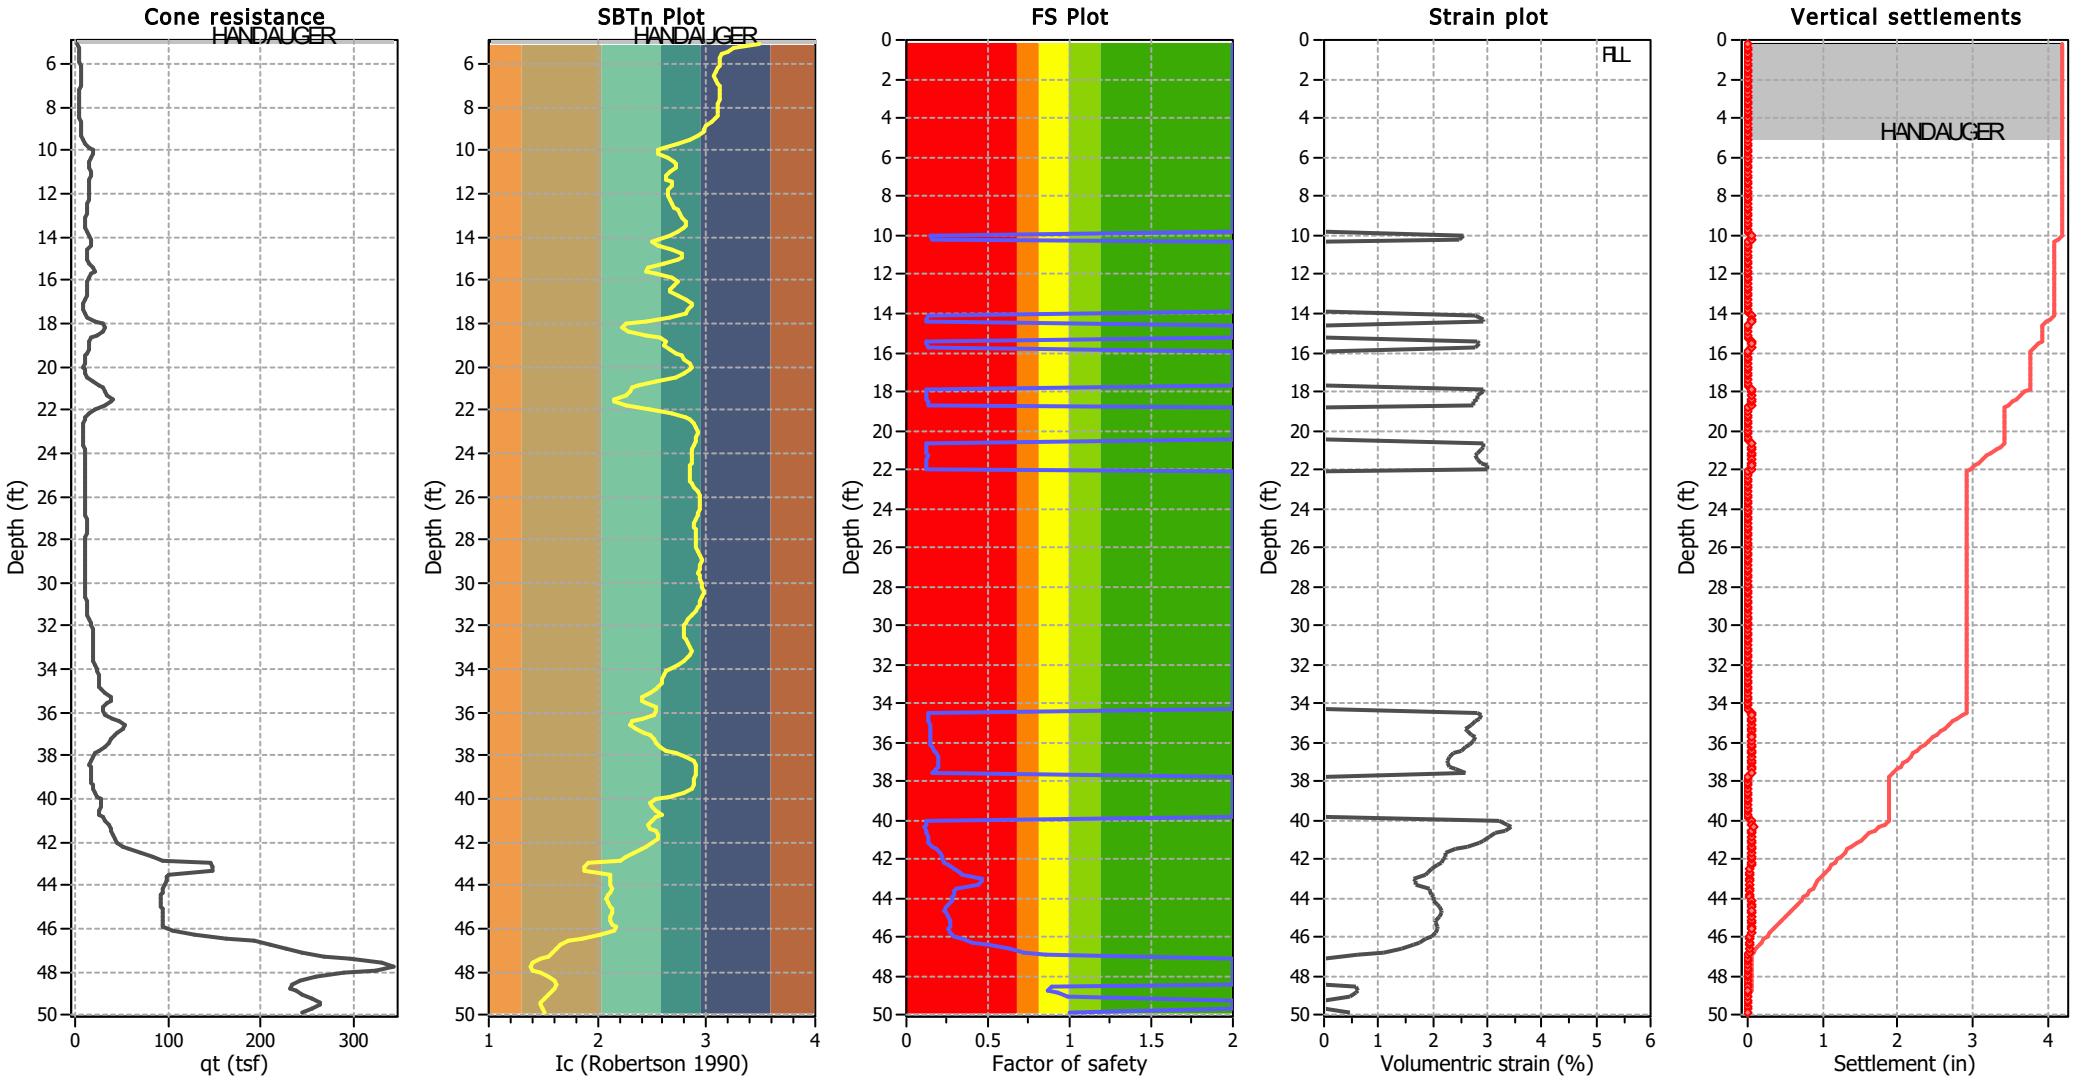
## Estimation of post-earthquake settlements



**Abbreviations**

| | |
|---|---|
| $q_t$: | Total cone resistance (cone resistance $q_c$ corrected for pore water effects) |
| $I_c$: | Soil Behaviour Type Index |
| FS: | Calculated Factor of Safety against liquefaction |
| Volumentric strain: | Post-liquefaction volumentric strain |

## Estimation of post-earthquake lateral Displacements

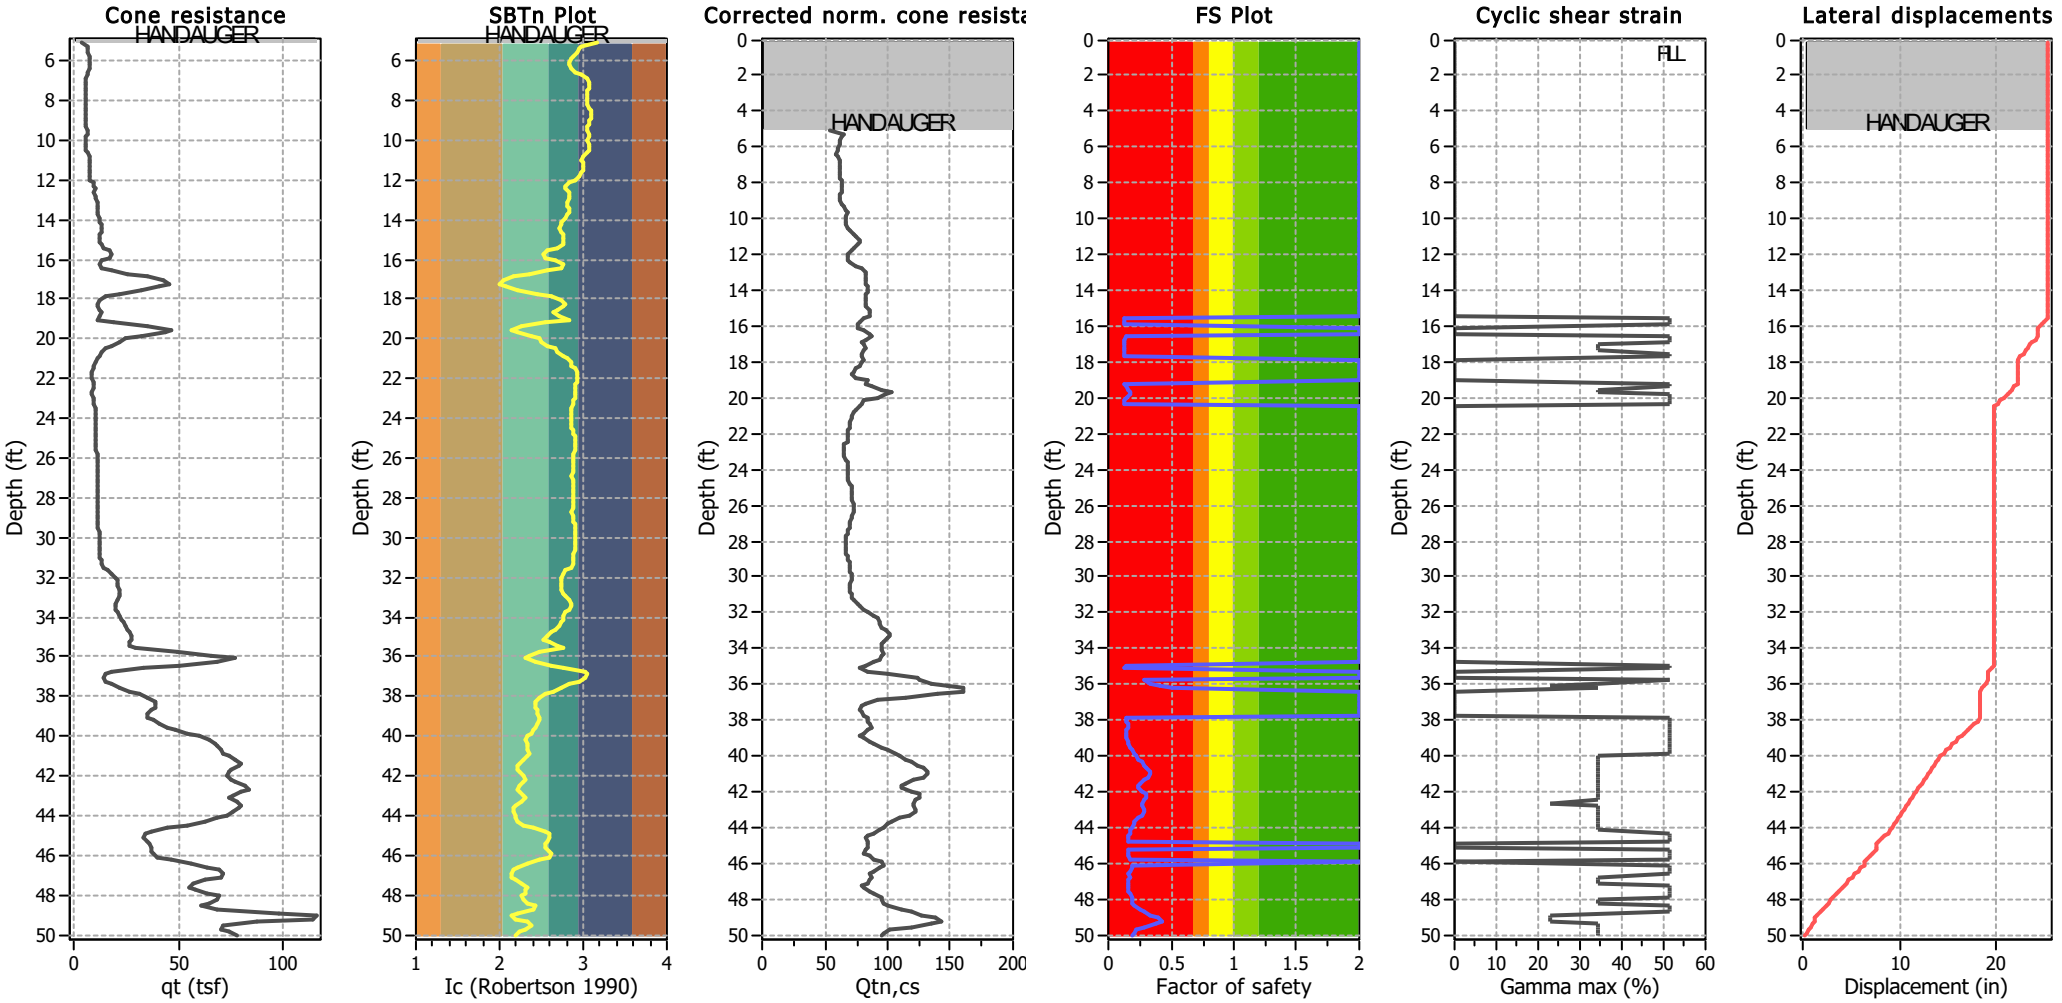
**Geometric parameters: Level ground (or gently sloping) with free face (L: 200.00 ft - H: 5.00 ft)**



**Abbreviations**

$q_t$: Total cone resistance (cone resistance $q_c$ corrected for pore water effects)
$I_c$: Soil Behaviour Type Index
$Q_{tn,cs}$: Equivalent clean sand normalized CPT total cone resistance
F.S.: Factor of safety
$\gamma_{max}$: Maximum cyclic shear strain
LDI: Lateral displacement index

**Surface condition**

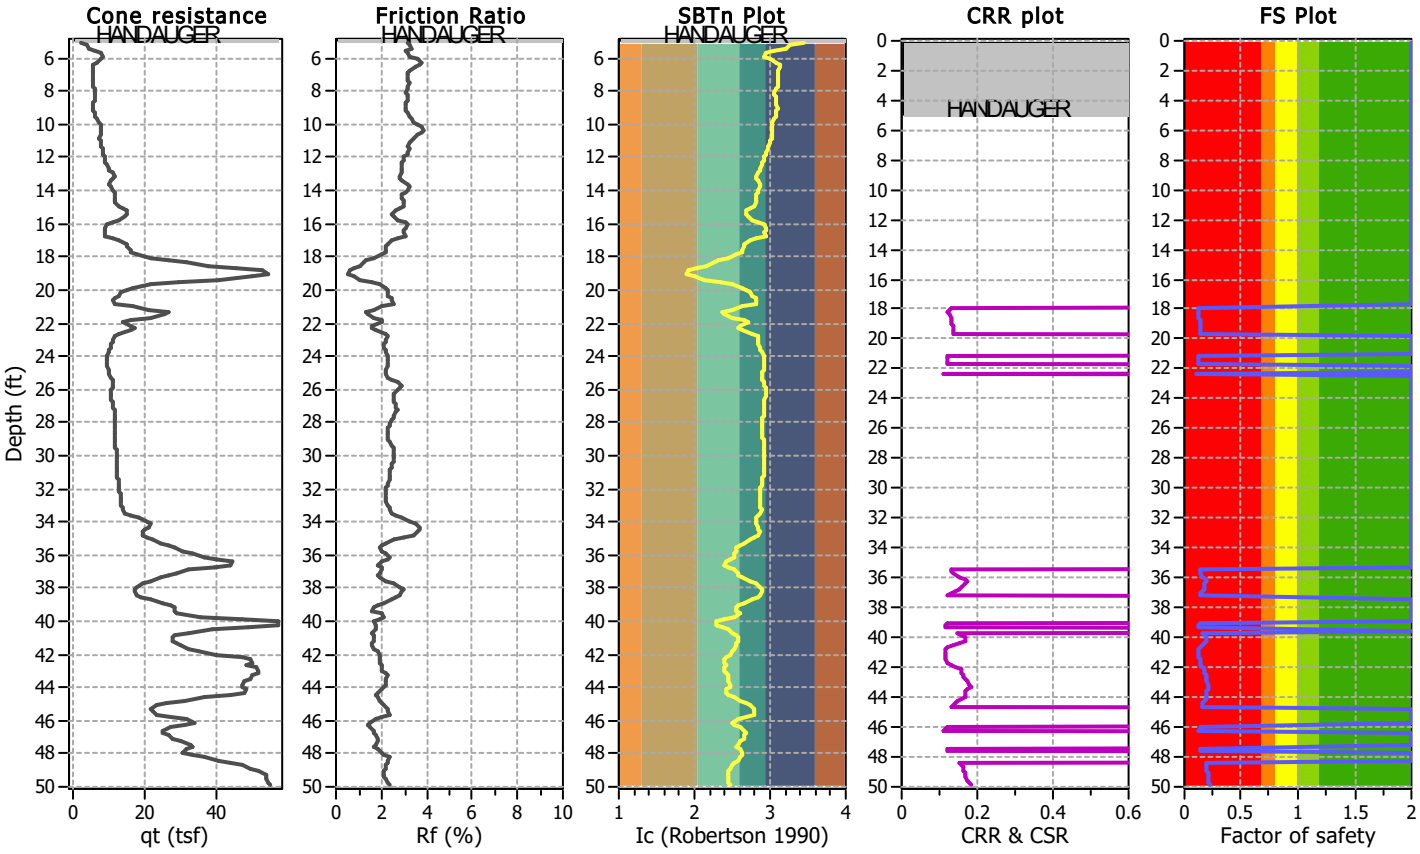
# LIQUEFACTION ANALYSIS REPORT

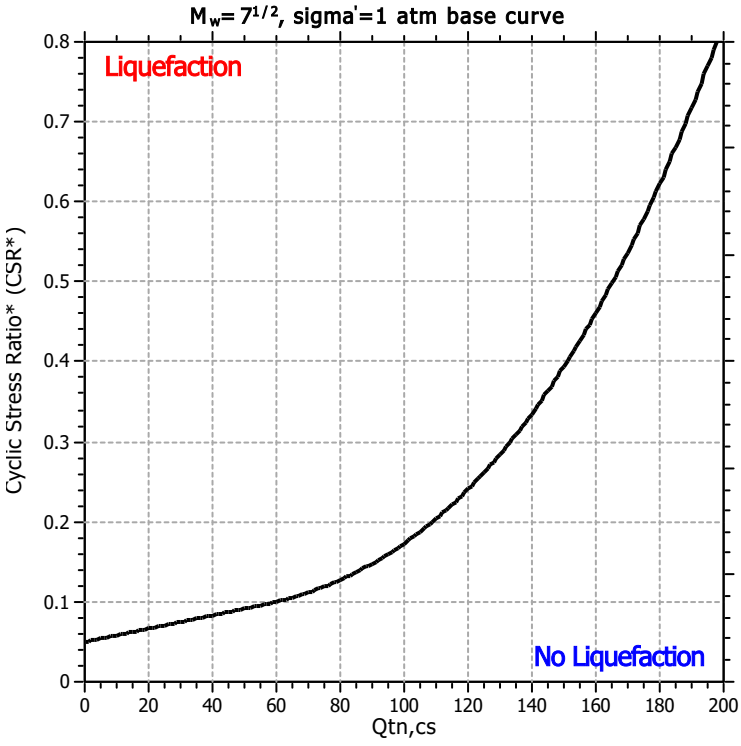
**Project title : AWWTF Improvements Project** **Location : 736 F Street, Arcata, California**

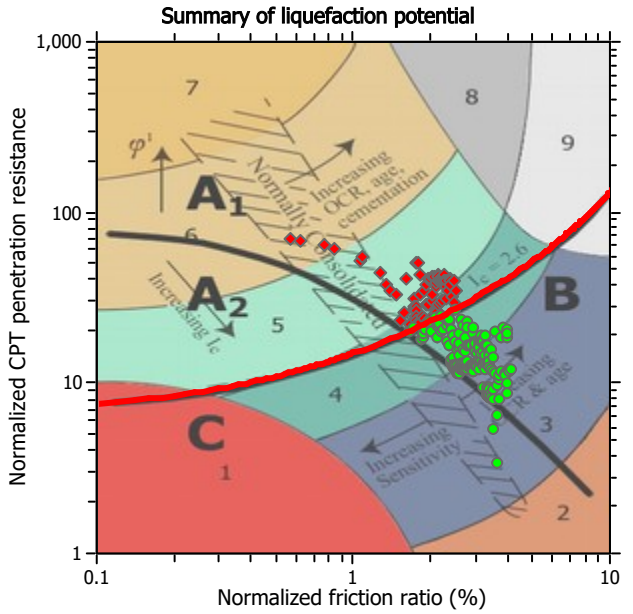
**CPT file : CPT-6**

**Input parameters and analysis data**

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| **Analysis method:** | **NCEER (1998)** | **G.W.T. (in-situ):** | **5.00 ft** | **Use fill:** | **Yes** | **Clay like behavior applied:** | **Sands only** |
| **Fines correction method:** | **NCEER (1998)** | **G.W.T. (earthq.):** | **0.00 ft** | **Fill height:** | **5.00 ft** | **Limit depth applie:** | **No** |
| **Points to test:** | **Based on Ic value** | **Average results interv:** | **3** | **Fill weight:** | **141.00 lb/ft³** | **Limit depth:** | **N/A** |
| **Earthquake magnitude $M_w$:** | **7.30** | **Ic cut-off value:** | **2.60** | **Trans. detect. applied:** | **No** | **MSF method:** | **Method based** |
| **Peak ground acceleration:** | **0.81** | **Unit weight calculatior** | **Based on SBT** | **$K_o$ applied:** | **Yes** | | |

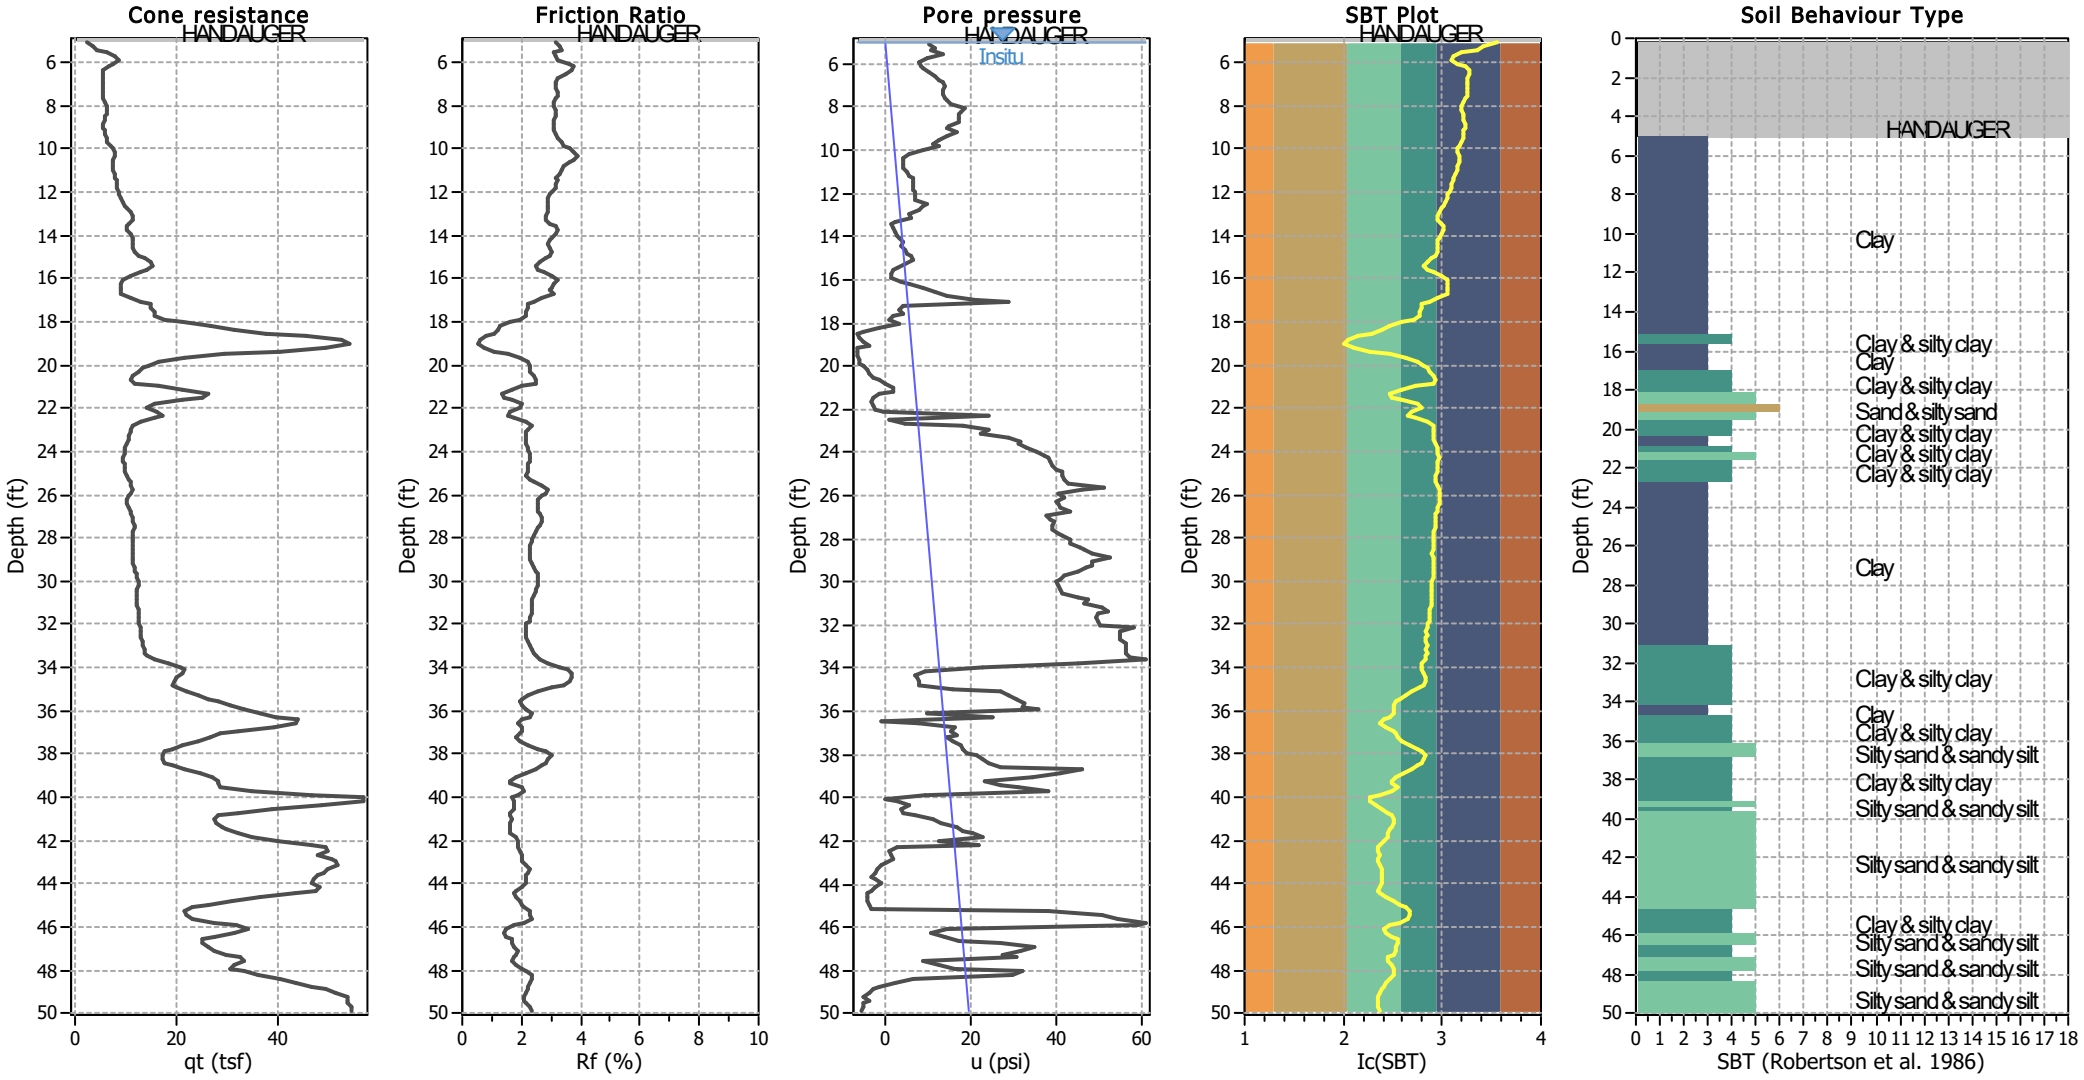






Zone $A_1$ : Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone $A_2$: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

## CPT basic interpretation plots



### Input parameters and analysis data

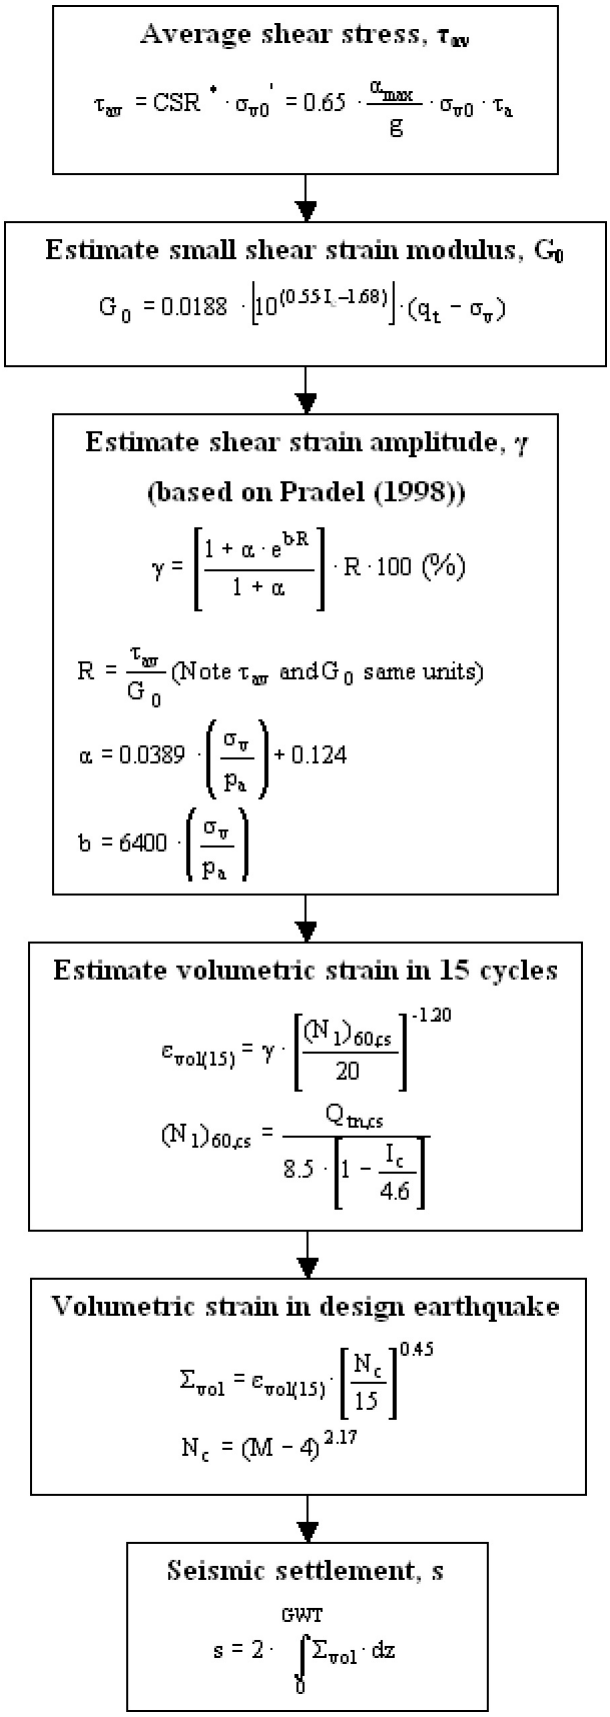
## Procedure for the estimation of seismic induced settlements in dry sands



Robertson, P.K. and Lisheng, S., 2010, "Estimation of seismic compression in dry soils using the CPT" FIFTH INTERNATIONAL CONFERENCE ON RECENT ADVANCES IN GEOTECHNICAL EARTHQUAKE ENGINEERING AND SOIL DYNAMICS, Symposium in honor of professor I. M. Idriss, San Diego, CA

## Liquefaction Potential Index (LPI) calculation procedure

Calculation of the Liquefaction Potential Index (LPI) is used to interpret the liquefaction assessment calculations in terms of severity over depth. The calculation procedure is based on the methology developed by Iwasaki (1982) and is adopted by AFPS.

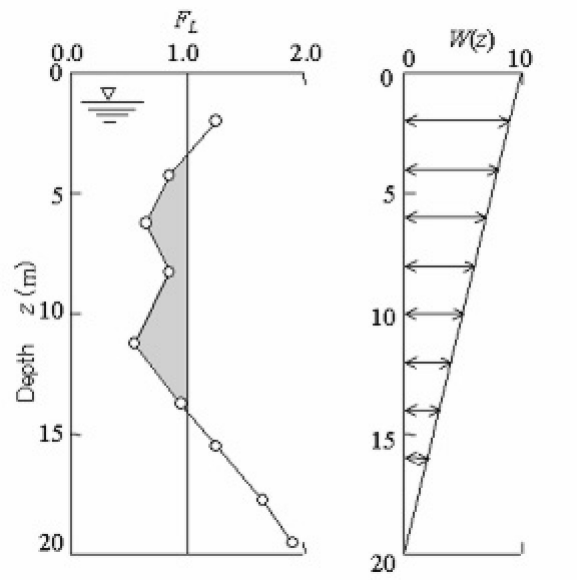
To estimate the severity of liquefaction extent at a given site, LPI is calculated based on the following equation:

$$\text{LPI} = \int_0^{20} (10 - 0{,}5z) \times F_L \times dz$$

where:
$F_L$ = 1 - F.S. when F.S. less than 1
$F_L$ = 0 when F.S. greater than 1
z depth of measurment in meters

Values of LPI range between zero (0) when no test point is characterized as liquefiable and 100 when all points are characterized as susceptible to liquefaction. Iwasaki proposed four (4) discrete categories based on the numeric value of LPI:

- LPI = 0 : Liquefaction risk is very low
- 0 < LPI <= 5 : Liquefaction risk is low
- 5 < LPI <= 15 : Liquefaction risk is high
- LPI > 15 : Liquefaction risk is very high



Graphical presentation of the LPI calculation procedure

## Date and Time of Analysis

Date: November 20, 2018 Time: 17:28:13

## Problem Title

Project Name: Wastewater Treatment Facility Improvements

Job Number: 7986.01

Client: Carollo Engineers

Engineer: LACO Associates

Description: Lateral Load Analysis - 12-inch square precast concrete

---

## Program Options and Settings

---

Computational Options:
- Use unfactored loads in computations (conventional analysis)

Engineering Units Used for Data Input and Computations:
- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

| | | |
|---|---|---|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 100 |

Loading Type and Number of Cycles of Loading:
- Static loading specified

- Use of p-y modification factors for p-y curves not selected
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
- Output files use decimal points to denote decimal symbols.
- Report only summary tables of pile-head deflection, maximum bending moment, and maximum shear force in output report file.
- No p-y curves to be computed and reported for user-specified depths
- Print using narrow report formats
  (Note: Some output information is omitted from the narrow report formats)

---

## Pile Structural Properties and Geometry

---

| | | |
|---|---|---|
| Number of pile sections defined | = | 1 |
| Total length of pile | = | 50.000 ft |
| Depth of ground surface below top of pile | = | 0.0000 ft |

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

| Point No. | Depth Below Pile Head feet | Pile Diameter inches |
|---|---|---|
| 1 | 0.000 | 12.0000 |
| 2 | 50.000 | 12.0000 |

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a square prestressed concrete pile

| | | |
|---|---|---|
| Length of section | = | 50.000000 ft |
| Pile Width | = | 12.000000 in |
| Corner Chamfer | = | 0.0000 in |
| Shear capacity of section | = | 0.0000 lbs |

## Ground Slope and Pile Batter Angles

| | | |
|---|---|---|
| Ground Slope Angle | = | 0.000 degrees |
| | = | 0.000 radians |
| Pile Batter Angle | = | 0.000 degrees |
| | = | 0.000 radians |

## Soil and Rock Layering Information

The soil profile is modelled using 5 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 0.0000 ft |
| Distance from top of pile to bottom of layer | = | 5.000000 ft |
| Effective unit weight at top of layer | = | 130.000000 pcf |
| Effective unit weight at bottom of layer | = | 130.000000 pcf |
| Friction angle at top of layer | = | 34.000000 deg. |
| Friction angle at bottom of layer | = | 34.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 2 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 5.000000 ft |
| Distance from top of pile to bottom of layer | = | 21.000000 ft |
| Effective unit weight at top of layer | = | 95.000000 pcf |
| Effective unit weight at bottom of layer | = | 100.000000 pcf |

| | | |
|---|---|---|
| Undrained cohesion at top of layer | = | 200.000000 psf |
| Undrained cohesion at bottom of layer | = | 500.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 21.000000 ft |
| Distance from top of pile to bottom of layer | = | 25.000000 ft |
| Effective unit weight at top of layer | = | 120.000000 pcf |
| Effective unit weight at bottom of layer | = | 120.000000 pcf |
| Friction angle at top of layer | = | 30.000000 deg. |
| Friction angle at bottom of layer | = | 30.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 4 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 25.000000 ft |
| Distance from top of pile to bottom of layer | = | 40.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 115.000000 pcf |
| Undrained cohesion at top of layer | = | 600.000000 psf |
| Undrained cohesion at bottom of layer | = | 800.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 5 is cemented silt with cohesion and friction

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 40.000000 ft |
| Distance from top of pile to bottom of layer | = | 70.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 110.000000 pcf |
| Undrained cohesion at top of layer | = | 350.000000 psf |
| Undrained cohesion at bottom of layer | = | 350.000000 psf |
| Friction angle at top of layer | = | 25.000000 deg. |
| Friction angle at bottom of layer | = | 25.000000 deg. |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for Epsilon-50 will be computed for this layer.
NOTE: Default values for subgrade k will be computed for this layer.

(Depth of the lowest soil layer extends 20.000 ft below the pile tip)

---

## Static Loading Type

---

Static loading criteria were used when computing p-y curves for all analyses.

## Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 2

| Load No. | Load Type | Condition 1 | Condition 2 | Axial Thrust Force, lbs |
|---|---|---|---|---|
| 1 | 5 | y = 0.500000 in | S = 0.0000 in/in | 50000. |
| 2 | 4 | y = 0.500000 in | M = 0.0000 in-lbs | 50000. |

V = shear force applied normal to pile axis
M = bending moment applied to pile head
y = lateral deflection normal to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applied to pile head
Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).
Thrust force is assumed to be acting axially for all pile batter angles.

## Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

### Pile Section No. 1:

#### Dimensions of Square Prestressed Pile Section:

Length of Section = 50.0000 ft
Pile Width = 12.000 in
Corner Chamfer = 0.000 in

#### Prestressing Strand Details:

Strand Type = PCI 270
Yield Stress, fpu = 270. ksi
Stress-strain curve defined using PCI 270 7-wire Lo-lax equation
If eps > 0.0086 fpu (ksi) = 270 - 0.04/(eps-0.007)
Number of Reinforcing Strands = 6
Cross-sectional Area of Single Strand = 0.153 sq. in.
Concrete Cover Thickness Over Strands = 2.000 in

#### Prestressing Strand Geometry:

| Strand No. | Diameter in | Area sq. in | X in | Y in |
|---|---|---|---|---|
| 1 | 0.500 | 0.153 | 3.750 | 0.000 |
| 2 | 0.500 | 0.153 | 1.875 | 3.248 |

| | | | | |
|---|---|---|---|---|
| 3 | 0.500 | 0.153 | -1.875 | 3.248 |
| 4 | 0.500 | 0.153 | -3.750 | 0.000 |
| 5 | 0.500 | 0.153 | -1.875 | -3.248 |
| 6 | 0.500 | 0.153 | 1.875 | -3.248 |

Computation of Loss of Prestress:

| | | |
|---|---|---|
| Initial Prestressing Force | = | 146.000 kips |
| Fraction of Loss of Prestress | = | 0.100 |
| Effective Prestressing Force After Losses | = | 131.400 kips |
| Area of Concrete, Ac | = | 143.082 sq.in |
| Area of Steel, As | = | 0.918 sq.in |
| Stress in Concrete After Losses, f_pc | = | 0.918 ksi |
| Stress in Steel After Losses | = | -143.137 ksi |
| Compressive Strain in Concrete After Losses | = | 0.0002080 |
| Tensile Strain in Steel After Losses | = | -0.0051120 |
| Axial Tension Load for Cracking of Concrete | = | -171.135 kips |

Estimated Structural Capacities Computed Using PCI Equations:

| | | |
|---|---|---|
| Nom. Axial Cap., Pn = (0.85 f'c - 0.60 f_pc) Ag | = | 655.054 kips |
| Unfac. Axial Load Cap. N = (0.33 f'c - 0.27 f_pc) Ag | = | 249.414 kips |
| Axial Capacity in Tension, Nt = As fpu | = | -247.860 kips |
| Nom. Moment Capacity, Mn = 0.37 D As fpu | = | 1100.498 in-kip |

Note: The estimate of nominal moment capacity is based on equations that assume compressive strength of concrete is 6,000 psi (41.4 MPa), the value of prestress after losses is 700 psi (4.83 MPa), and axial thrust force is zero. When input values for these factors are different, the estimated value of nominal moment capacity will differ from the capacity computed by LPile and should be considered only as an approximate check.

Concrete Properties:

| | | |
|---|---|---|
| Compressive Strength of Concrete | = | 6000. psi |
| Modulus of Elasticity of Concrete | = | 4415201. psi |
| Modulus of Rupture of Prestressed Concrete | = | -309.838668 psi |
| Compression Strain at Peak Stress | = | 0.002310 |
| Tensile Strain at Fracture of Concrete | = | -0.0000604 |
| Maximum Coarse Aggregate Size | = | 0.750000 in |

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

| Number | Axial Thrust Force kips |
|---|---|
| 1 | 50.000 |

---

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

---

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

| Load No. | Axial Thrust kips | Nominal Mom. Cap. in-kip | Max. Comp. Strain |
|---|---|---|---|

| | | | |
|---|---|---|---|
| 1 | 50.000 | 1060.461 | 0.00300000 |

Note that the values of moment capacity in the table above are not factored by a strength reduction factor (phi-factor).

In ACI 318, the value of the strength reduction factor depends on whether the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to ACI 318, Section 9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

| Axial Load No. | Resist. Factor for Moment | Nominal Moment Cap in-kips | Ult. (Fac) Ax. Thrust kips | Ult. (Fac) Moment Cap in-kips | Bend. Stiff. at Ult Mom kip-in^2 |
|---|---|---|---|---|---|
| 1 | 0.65 | 1060. | 32.500000 | 689.299356 | 4518034. |
| 1 | 0.70 | 1060. | 35.000000 | 742.322383 | 3846872. |
| 1 | 0.75 | 1060. | 37.500000 | 795.345411 | 3272675. |

## Layering Correction Equivalent Depths of Soil & Rock Layers

| Layer No. | Top of Layer Below Pile Head ft | Equivalent Top Depth Below Grnd Surf ft | Same Layer Type As Layer Above | Layer is Rock or is Below Rock Layer | F0 Integral for Layer lbs | F1 Integral for Layer lbs |
|---|---|---|---|---|---|---|
| 1 | 0.00 | 0.00 | N.A. | No | 0.00 | 20692. |
| 2 | 5.0000 | 13.2346 | No | No | 20692. | 50400. |
| 3 | 21.0000 | 9.8929 | No | No | 71092. | 114329. |
| 4 | 25.0000 | 37.2813 | No | No | 185421. | 94399. |
| 5 | 40.0000 | 18.4599 | No | No | 279820. | N.A. |

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

## Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs

Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

| Load Case No. | Load Type | Pile-head Deflection inches | Pile-head Rotation radians | Max Shear in Pile lbs | Max Moment in Pile in-lbs |
|---|---|---|---|---|---|
| 1 | 5 | 0.500000 | 0.0000 | 21646. | -840267. |
| 2 | 4 | 0.500000 | -0.006374 | 12605. | 447900. |

Maximum pile-head deflection = 0.5000000000 inches
Maximum pile-head rotation = -0.0063738074 radians = -0.365192 deg.

The analysis ended normally.

## Date and Time of Analysis

Date: November 20, 2018 Time: 17:48:26

## Problem Title

Project Name: Wastewater Treatment Facility Improvements

Job Number: 7986.01

New LPile (USCS units) - 12 inch sq - 1 in def.lp10o

Client: Carollo Engineers

Engineer: LACO Associates

Description: Lateral Load Analysis - 12-inch square precast concrete

---

## Program Options and Settings

---

Computational Options:
- Use unfactored loads in computations (conventional analysis)

Engineering Units Used for Data Input and Computations:
- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

| | | |
|---|---|---|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 100 |

Loading Type and Number of Cycles of Loading:
- Static loading specified

- Use of p-y modification factors for p-y curves not selected
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
- Output files use decimal points to denote decimal symbols.
- Report only summary tables of pile-head deflection, maximum bending moment, and maximum shear force in output report file.
- No p-y curves to be computed and reported for user-specified depths
- Print using narrow report formats
  (Note: Some output information is omitted from the narrow report formats)

## Pile Structural Properties and Geometry

---

| | | |
|---|---|---|
| Number of pile sections defined | = | 1 |
| Total length of pile | = | 50.000 ft |
| Depth of ground surface below top of pile | = | 0.0000 ft |

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

| Point No. | Depth Below Pile Head feet | Pile Diameter inches |
|---|---|---|
| 1 | 0.000 | 12.0000 |
| 2 | 50.000 | 12.0000 |

Input Structural Properties for Pile Sections:

Pile Section No. 1:

| | | |
|---|---|---|
| Section 1 is a square prestressed concrete pile | | |
| Length of section | = | 50.000000 ft |
| Pile Width | = | 12.000000 in |
| Corner Chamfer | = | 0.0000 in |
| Shear capacity of section | = | 0.0000 lbs |

## Ground Slope and Pile Batter Angles

| | | |
|---|---|---|
| Ground Slope Angle | = | 0.000 degrees |
| | = | 0.000 radians |
| Pile Batter Angle | = | 0.000 degrees |
| | = | 0.000 radians |

## Soil and Rock Layering Information

The soil profile is modelled using 5 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 0.0000 ft |
| Distance from top of pile to bottom of layer | = | 5.000000 ft |
| Effective unit weight at top of layer | = | 130.000000 pcf |
| Effective unit weight at bottom of layer | = | 130.000000 pcf |
| Friction angle at top of layer | = | 34.000000 deg. |
| Friction angle at bottom of layer | = | 34.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 2 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 5.000000 ft |
| Distance from top of pile to bottom of layer | = | 21.000000 ft |
| Effective unit weight at top of layer | = | 95.000000 pcf |
| Effective unit weight at bottom of layer | = | 100.000000 pcf |

| | | |
|---|---|---|
| Undrained cohesion at top of layer | = | 200.000000 psf |
| Undrained cohesion at bottom of layer | = | 500.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 21.000000 ft |
| Distance from top of pile to bottom of layer | = | 25.000000 ft |
| Effective unit weight at top of layer | = | 120.000000 pcf |
| Effective unit weight at bottom of layer | = | 120.000000 pcf |
| Friction angle at top of layer | = | 30.000000 deg. |
| Friction angle at bottom of layer | = | 30.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 4 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 25.000000 ft |
| Distance from top of pile to bottom of layer | = | 40.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 115.000000 pcf |
| Undrained cohesion at top of layer | = | 600.000000 psf |
| Undrained cohesion at bottom of layer | = | 800.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 5 is cemented silt with cohesion and friction

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 40.000000 ft |
| Distance from top of pile to bottom of layer | = | 70.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 110.000000 pcf |
| Undrained cohesion at top of layer | = | 350.000000 psf |
| Undrained cohesion at bottom of layer | = | 350.000000 psf |
| Friction angle at top of layer | = | 25.000000 deg. |
| Friction angle at bottom of layer | = | 25.000000 deg. |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for Epsilon-50 will be computed for this layer.
NOTE: Default values for subgrade k will be computed for this layer.

(Depth of the lowest soil layer extends 20.000 ft below the pile tip)

---

## Static Loading Type

---

Static loading criteria were used when computing p-y curves for all analyses.

## Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 2

| Load No. | Load Type | Condition 1 | | Condition 2 | | Axial Thrust Force, lbs |
|---|---|---|---|---|---|---|
| 1 | 5 | y = | 1.000000 in | S = | 0.0000 in/in | 50000. |
| 2 | 4 | y = | 1.000000 in | M = | 0.0000 in-lbs | 50000. |

V = shear force applied normal to pile axis
M = bending moment applied to pile head
y = lateral deflection normal to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applied to pile head
Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).
Thrust force is assumed to be acting axially for all pile batter angles.

## Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

### Pile Section No. 1:

#### Dimensions of Square Prestressed Pile Section:

| | | |
|---|---|---|
| Length of Section | = | 50.0000 ft |
| Pile Width | = | 12.000 in |
| Corner Chamfer | = | 0.000 in |

| Cross-sectional Area of Single Strand | = | 0.153 sq. in. |
| Concrete Cover Thickness Over Strands | = | 2.000 in |

#### Prestressing Strand Geometry:

| Strand No. | Diameter in | Area sq. in | X in | Y in |
|---|---|---|---|---|
| 1 | 0.500 | 0.153 | 3.750 | 0.000 |
| 2 | 0.500 | 0.153 | 1.875 | 3.248 |

| | | | | |
|---|---|---|---|---|
| 3 | 0.500 | 0.153 | -1.875 | 3.248 |
| 4 | 0.500 | 0.153 | -3.750 | 0.000 |
| 5 | 0.500 | 0.153 | -1.875 | -3.248 |
| 6 | 0.500 | 0.153 | 1.875 | -3.248 |

Computation of Loss of Prestress:

| | | |
|---|---|---|
| Initial Prestressing Force | = | 146.000 kips |
| Fraction of Loss of Prestress | = | 0.100 |
| Effective Prestressing Force After Losses | = | 131.400 kips |
| Area of Concrete, Ac | = | 143.082 sq.in |
| Area of Steel, As | = | 0.918 sq.in |
| Stress in Concrete After Losses, f_pc | = | 0.918 ksi |
| Stress in Steel After Losses | = | -143.137 ksi |
| Compressive Strain in Concrete After Losses | = | 0.0002080 |
| Tensile Strain in Steel After Losses | = | -0.0051120 |
| Axial Tension Load for Cracking of Concrete | = | -171.135 kips |

Estimated Structural Capacities Computed Using PCI Equations:

| | | |
|---|---|---|
| Nom. Axial Cap., Pn = (0.85 f'c - 0.60 f_pc) Ag | = | 655.054 kips |
| Unfac. Axial Load Cap. N = (0.33 f'c - 0.27 f_pc) Ag | = | 249.414 kips |
| Axial Capacity in Tension, Nt = As fpu | = | -247.860 kips |
| Nom. Moment Capacity, Mn = 0.37 D As fpu | = | 1100.498 in-kip |

Note: The estimate of nominal moment capacity is based on equations that assume compressive strength of concrete is 6,000 psi (41.4 MPa), the value of prestress after losses is 700 psi (4.83 MPa), and axial thrust force is zero. When input values for these factors are different, the estimated value of nominal moment capacity will differ from the capacity computed by LPile and should be considered only as an approximate check.

Concrete Properties:

| | | |
|---|---|---|
| Compressive Strength of Concrete | = | 6000. psi |
| Modulus of Elasticity of Concrete | = | 4415201. psi |
| Modulus of Rupture of Prestressed Concrete | = | -309.838668 psi |
| Compression Strain at Peak Stress | = | 0.002310 |
| Tensile Strain at Fracture of Concrete | = | -0.0000604 |
| Maximum Coarse Aggregate Size | = | 0.750000 in |

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

| Number | Axial Thrust Force kips |
|---|---|
| 1 | 50.000 |

---

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

---

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

| Load No. | Axial Thrust kips | Nominal Mom. Cap. in-kip | Max. Comp. Strain |
|---|---|---|---|

| | | | |
|---|---|---|---|
| 1 | 50.000 | 1060.461 | 0.00300000 |

Note that the values of moment capacity in the table above are not factored by a strength reduction factor (phi-factor).

In ACI 318, the value of the strength reduction factor depends on whether the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to ACI 318, Section 9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

| Axial Load No. | Resist. Factor for Moment | Nominal Moment Cap in-kips | Ult. (Fac) Ax. Thrust kips | Ult. (Fac) Moment Cap in-kips | Bend. Stiff. at Ult Mom kip-in^2 |
|---|---|---|---|---|---|
| 1 | 0.65 | 1060. | 32.500000 | 689.299356 | 4518034. |
| 1 | 0.70 | 1060. | 35.000000 | 742.322383 | 3846872. |
| 1 | 0.75 | 1060. | 37.500000 | 795.345411 | 3272675. |

---

## Layering Correction Equivalent Depths of Soil & Rock Layers

---

| Layer No. | Top of Layer Below Pile Head ft | Equivalent Top Depth Below Grnd Surf ft | Same Layer Type As Layer Above | Layer is Rock or is Below Rock Layer | F0 Integral for Layer lbs | F1 Integral for Layer lbs |
|---|---|---|---|---|---|---|
| 1 | 0.00 | 0.00 | N.A. | No | 0.00 | 20692. |
| 2 | 5.0000 | 13.2346 | No | No | 20692. | 50400. |
| 3 | 21.0000 | 9.8929 | No | No | 71092. | 114329. |
| 4 | 25.0000 | 37.2813 | No | No | 185421. | 94399. |
| 5 | 40.0000 | 18.4599 | No | No | 279820. | N.A. |

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

---

## Summary of Pile-head Responses for Conventional Analyses

---

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs

New LPile (USCS units) - 12 inch sq - 1 in def.lp10o
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

| Load Case No. | Load Type | Pile-head Deflection inches | Pile-head Rotation radians | Max Shear in Pile lbs | Max Moment in Pile in-lbs |
|---|---|---|---|---|---|
| 1 | 5 | 1.000000 | 0.0000 | 25755. | -1029133. |
| 2 | 4 | 1.000000 | -0.012384 | 16941. | 652861. |

Maximum pile-head deflection = 1.0000000000 inches
Maximum pile-head rotation = -0.0123843047 radians = -0.709568 deg.

The analysis ended normally.

## Date and Time of Analysis

Date: November 20, 2018 Time: 18:03:48

## Problem Title

Project Name: Wastewater Treatment Facility Improvements

Job Number: 7986.01

Client: Carollo Engineers

Engineer: LACO Associates

Description: Lateral Load Analysis - 14-inch square precast concrete

---

## Program Options and Settings

---

Computational Options:
- Use unfactored loads in computations (conventional analysis)

Engineering Units Used for Data Input and Computations:
- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

| | | |
|---|---|---|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 100 |

Loading Type and Number of Cycles of Loading:
- Static loading specified

- Use of p-y modification factors for p-y curves not selected
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
- Output files use decimal points to denote decimal symbols.
- Report only summary tables of pile-head deflection, maximum bending moment, and maximum shear force in output report file.
- No p-y curves to be computed and reported for user-specified depths
- Print using narrow report formats
  (Note: Some output information is omitted from the narrow report formats)

---

## Pile Structural Properties and Geometry

---

| | | |
|---|---|---|
| Number of pile sections defined | = | 1 |
| Total length of pile | = | 50.000 ft |
| Depth of ground surface below top of pile | = | 0.0000 ft |

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

| Point No. | Depth Below Pile Head feet | Pile Diameter inches |
|---|---|---|
| 1 | 0.000 | 14.0000 |
| 2 | 50.000 | 14.0000 |

Input Structural Properties for Pile Sections:

Pile Section No. 1:

| | | |
|---|---|---|
| Section 1 is a square prestressed concrete pile | | |
| Length of section | = | 50.000000 ft |
| Pile Width | = | 14.000000 in |
| Corner Chamfer | = | 0.0000 in |
| Shear capacity of section | = | 0.0000 lbs |

## Ground Slope and Pile Batter Angles

| | | |
|---|---|---|
| Ground Slope Angle | = | 0.000 degrees |
| | = | 0.000 radians |
| Pile Batter Angle | = | 0.000 degrees |
| | = | 0.000 radians |

## Soil and Rock Layering Information

The soil profile is modelled using 5 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 0.0000 ft |
| Distance from top of pile to bottom of layer | = | 5.000000 ft |
| Effective unit weight at top of layer | = | 130.000000 pcf |
| Effective unit weight at bottom of layer | = | 130.000000 pcf |
| Friction angle at top of layer | = | 34.000000 deg. |
| Friction angle at bottom of layer | = | 34.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 2 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 5.000000 ft |
| Distance from top of pile to bottom of layer | = | 21.000000 ft |
| Effective unit weight at top of layer | = | 95.000000 pcf |
| Effective unit weight at bottom of layer | = | 100.000000 pcf |

| | | |
|---|---|---|
| Undrained cohesion at top of layer | = | 200.000000 psf |
| Undrained cohesion at bottom of layer | = | 500.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 21.000000 ft |
| Distance from top of pile to bottom of layer | = | 25.000000 ft |
| Effective unit weight at top of layer | = | 120.000000 pcf |
| Effective unit weight at bottom of layer | = | 120.000000 pcf |
| Friction angle at top of layer | = | 30.000000 deg. |
| Friction angle at bottom of layer | = | 30.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 4 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 25.000000 ft |
| Distance from top of pile to bottom of layer | = | 40.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 115.000000 pcf |
| Undrained cohesion at top of layer | = | 600.000000 psf |
| Undrained cohesion at bottom of layer | = | 800.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 5 is cemented silt with cohesion and friction

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 40.000000 ft |
| Distance from top of pile to bottom of layer | = | 70.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 110.000000 pcf |
| Undrained cohesion at top of layer | = | 350.000000 psf |
| Undrained cohesion at bottom of layer | = | 350.000000 psf |
| Friction angle at top of layer | = | 25.000000 deg. |
| Friction angle at bottom of layer | = | 25.000000 deg. |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for Epsilon-50 will be computed for this layer.
NOTE: Default values for subgrade k will be computed for this layer.

(Depth of the lowest soil layer extends 20.000 ft below the pile tip)

---

## Static Loading Type

---

Static loading criteria were used when computing p-y curves for all analyses.

## Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 2

| Load No. | Load Type | Condition 1 | | Condition 2 | | Axial Thrust Force, lbs |
|---|---|---|---|---|---|---|
| 1 | 5 | y = | 0.500000 in | S = | 0.0000 in/in | 50000. |
| 2 | 4 | y = | 0.500000 in | M = | 0.0000 in-lbs | 50000. |

V = shear force applied normal to pile axis
M = bending moment applied to pile head
y = lateral deflection normal to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applied to pile head
Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).
Thrust force is assumed to be acting axially for all pile batter angles.

## Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions of Square Prestressed Pile Section:

| | | |
|---|---|---|
| Length of Section | = | 50.0000 ft |
| Pile Width | = | 14.000 in |
| Corner Chamfer | = | 0.000 in |

Prestressing Strand Details:

| | | |
|---|---|---|
| Strand Type | = | PCI 270 |
| Yield Stress, fpu | = | 270. ksi |

Stress-strain curve defined using PCI 270 7-wire Lo-lax equation
If eps > 0.0086 fpu (ksi) = 270 - 0.04/(eps-0.007)

| | | |
|---|---|---|
| Number of Reinforcing Strands | = | 6 |
| Cross-sectional Area of Single Strand | = | 0.153 sq. in. |
| Concrete Cover Thickness Over Strands | = | 2.000 in |

Prestressing Strand Geometry:

| Strand No. | Diameter in | Area sq. in | X in | Y in |
|---|---|---|---|---|
| 1 | 0.500 | 0.153 | 4.750 | 0.000 |
| 2 | 0.500 | 0.153 | 2.375 | 4.114 |

| | | | | |
|---|---|---|---|---|
| 3 | 0.500 | 0.153 | -2.375 | 4.114 |
| 4 | 0.500 | 0.153 | -4.750 | 0.000 |
| 5 | 0.500 | 0.153 | -2.375 | -4.114 |
| 6 | 0.500 | 0.153 | 2.375 | -4.114 |

Computation of Loss of Prestress:
---

| | | |
|---|---|---|
| Initial Prestressing Force | = | 146.000 kips |
| Fraction of Loss of Prestress | = | 0.100 |
| Effective Prestressing Force After Losses | = | 131.400 kips |
| Area of Concrete, Ac | = | 195.082 sq.in |
| Area of Steel, As | = | 0.918 sq.in |
| Stress in Concrete After Losses, f_pc | = | 0.674 ksi |
| Stress in Steel After Losses | = | -143.137 ksi |
| Compressive Strain in Concrete After Losses | = | 0.0001526 |
| Tensile Strain in Steel After Losses | = | -0.0051120 |
| Axial Tension Load for Cracking of Concrete | = | -185.012 kips |

Estimated Structural Capacities Computed Using PCI Equations:
---

| | | |
|---|---|---|
| Nom. Axial Cap., Pn = (0.85 f'c - 0.60 f_pc) Ag | = | 920.389 kips |
| Unfac. Axial Load Cap. N = (0.33 f'c - 0.27 f_pc) Ag | = | 352.435 kips |
| Axial Capacity in Tension, Nt = As fpu | = | -247.860 kips |
| Nom. Moment Capacity, Mn = 0.37 D As fpu | = | 1283.915 in-kip |

Note: The estimate of nominal moment capacity is based on equations that assume compressive strength of concrete is 6,000 psi (41.4 MPa), the value of prestress after losses is 700 psi (4.83 MPa), and axial thrust force is zero. When input values for these factors are different, the estimated value of nominal moment capacity will differ from the capacity computed by LPile and should be considered only as an approximate check.

Concrete Properties:
---

| | | |
|---|---|---|
| Compressive Strength of Concrete | = | 6000. psi |
| Modulus of Elasticity of Concrete | = | 4415201. psi |
| Modulus of Rupture of Prestressed Concrete | = | -309.838668 psi |
| Compression Strain at Peak Stress | = | 0.002310 |
| Tensile Strain at Fracture of Concrete | = | -0.0000604 |
| Maximum Coarse Aggregate Size | = | 0.750000 in |

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

| Number | Axial Thrust Force kips |
|---|---|
| 1 | 50.000 |

---
Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1
---

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

| Load No. | Axial Thrust kips | Nominal Mom. Cap. in-kip | Max. Comp. Strain |
|---|---|---|---|

| | | | |
|---|---|---|---|
| 1 | 50.000 | 1440.759 | 0.00300000 |

Note that the values of moment capacity in the table above are not factored by a strength reduction factor (phi-factor).

In ACI 318, the value of the strength reduction factor depends on whether the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to ACI 318, Section 9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

| Axial Load No. | Resist. Factor for Moment | Nominal Moment Cap in-kips | Ult. (Fac) Ax. Thrust kips | Ult. (Fac) Moment Cap in-kips | Bend. Stiff. at Ult Mom kip-in^2 |
|---|---|---|---|---|---|
| 1 | 0.65 | 1441. | 32.500000 | 936.493219 | 6286542. |
| 1 | 0.70 | 1441. | 35.000000 | 1009. | 5209154. |
| 1 | 0.75 | 1441. | 37.500000 | 1081. | 4380143. |

## Layering Correction Equivalent Depths of Soil & Rock Layers

| Layer No. | Top of Layer Below Pile Head ft | Equivalent Top Depth Below Grnd Surf ft | Same Layer Type As Layer Above | Layer is Rock or is Below Rock Layer | F0 Integral for Layer lbs | F1 Integral for Layer lbs |
|---|---|---|---|---|---|---|
| 1 | 0.00 | 0.00 | N.A. | No | 0.00 | 23282. |
| 2 | 5.0000 | 12.9410 | No | No | 23282. | 58800. |
| 3 | 21.0000 | 10.2698 | No | No | 82082. | 123282. |
| 4 | 25.0000 | 35.8874 | No | No | 205364. | 110132. |
| 5 | 40.0000 | 19.0666 | No | No | 315496. | N.A. |

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

## Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs

Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

| Load Case No. | Load Type | Pile-head Deflection inches | Pile-head Rotation radians | Max Shear in Pile lbs | Max Moment in Pile in-lbs |
|---|---|---|---|---|---|
| 1 | 5 | 0.500000 | 0.0000 | 25700. | -1086502. |
| 2 | 4 | 0.500000 | -0.005433 | 15910. | 591436. |

Maximum pile-head deflection = 0.5000000000 inches
Maximum pile-head rotation = -0.0054329859 radians = -0.311287 deg.

The analysis ended normally.

## Date and Time of Analysis

Date: November 20, 2018 Time: 18:13:35

## Problem Title

Project Name: Wastewater Treatment Facility Improvements

Job Number: 7986.01

New LPile (USCS units) - 14 inch sq - 1 in def.lp10o

Client: Carollo Engineers

Engineer: LACO Associates

Description: Lateral Load Analysis - 14-inch square precast concrete

---

## Program Options and Settings

---

Computational Options:
- Use unfactored loads in computations (conventional analysis)

Engineering Units Used for Data Input and Computations:
- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

| | | |
|---|---|---|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 100 |

Loading Type and Number of Cycles of Loading:
- Static loading specified

- Use of p-y modification factors for p-y curves not selected
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
- Output files use decimal points to denote decimal symbols.
- Report only summary tables of pile-head deflection, maximum bending moment, and maximum shear force in output report file.
- No p-y curves to be computed and reported for user-specified depths
- Print using narrow report formats
  (Note: Some output information is omitted from the narrow report formats)

---

## Pile Structural Properties and Geometry

---

| | | |
|---|---|---|
| Number of pile sections defined | = | 1 |
| Total length of pile | = | 50.000 ft |
| Depth of ground surface below top of pile | = | 0.0000 ft |

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

| Point No. | Depth Below Pile Head feet | Pile Diameter inches |
|---|---|---|
| 1 | 0.000 | 14.0000 |
| 2 | 50.000 | 14.0000 |

Input Structural Properties for Pile Sections:

Pile Section No. 1:

| | | |
|---|---|---|
| Section 1 is a square prestressed concrete pile | | |
| Length of section | = | 50.000000 ft |
| Pile Width | = | 14.000000 in |
| Corner Chamfer | = | 0.0000 in |
| Shear capacity of section | = | 0.0000 lbs |

## Ground Slope and Pile Batter Angles

| | | |
|---|---|---|
| Ground Slope Angle | = | 0.000 degrees |
| | = | 0.000 radians |
| Pile Batter Angle | = | 0.000 degrees |
| | = | 0.000 radians |

## Soil and Rock Layering Information

The soil profile is modelled using 5 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 0.0000 ft |
| Distance from top of pile to bottom of layer | = | 5.000000 ft |
| Effective unit weight at top of layer | = | 130.000000 pcf |
| Effective unit weight at bottom of layer | = | 130.000000 pcf |
| Friction angle at top of layer | = | 34.000000 deg. |
| Friction angle at bottom of layer | = | 34.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 2 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 5.000000 ft |
| Distance from top of pile to bottom of layer | = | 21.000000 ft |
| Effective unit weight at top of layer | = | 95.000000 pcf |
| Effective unit weight at bottom of layer | = | 100.000000 pcf |

| | | |
|---|---|---|
| Undrained cohesion at top of layer | = | 200.000000 psf |
| Undrained cohesion at bottom of layer | = | 500.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 21.000000 ft |
| Distance from top of pile to bottom of layer | = | 25.000000 ft |
| Effective unit weight at top of layer | = | 120.000000 pcf |
| Effective unit weight at bottom of layer | = | 120.000000 pcf |
| Friction angle at top of layer | = | 30.000000 deg. |
| Friction angle at bottom of layer | = | 30.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 4 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 25.000000 ft |
| Distance from top of pile to bottom of layer | = | 40.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 115.000000 pcf |
| Undrained cohesion at top of layer | = | 600.000000 psf |
| Undrained cohesion at bottom of layer | = | 800.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 5 is cemented silt with cohesion and friction

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 40.000000 ft |
| Distance from top of pile to bottom of layer | = | 70.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 110.000000 pcf |
| Undrained cohesion at top of layer | = | 350.000000 psf |
| Undrained cohesion at bottom of layer | = | 350.000000 psf |
| Friction angle at top of layer | = | 25.000000 deg. |
| Friction angle at bottom of layer | = | 25.000000 deg. |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for Epsilon-50 will be computed for this layer.
NOTE: Default values for subgrade k will be computed for this layer.

(Depth of the lowest soil layer extends 20.000 ft below the pile tip)

---

## Static Loading Type

---

Static loading criteria were used when computing p-y curves for all analyses.

---

## Pile-head Loading and Pile-head Fixity Conditions

---

Number of loads specified = 2

| Load No. | Load Type | Condition 1 | | Condition 2 | | Axial Thrust Force, lbs |
|---|---|---|---|---|---|---|
| 1 | 5 | y = | 1.000000 in | S = | 0.0000 in/in | 50000. |
| 2 | 4 | y = | 1.000000 in | M = | 0.0000 in-lbs | 50000. |

V = shear force applied normal to pile axis
M = bending moment applied to pile head
y = lateral deflection normal to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applied to pile head
Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).
Thrust force is assumed to be acting axially for all pile batter angles.

---

## Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

---

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

### Dimensions of Square Prestressed Pile Section:

| | | |
|---|---|---|
| Length of Section | = | 50.0000 ft |
| Pile Width | = | 14.000 in |
| Corner Chamfer | = | 0.000 in |

### Prestressing Strand Details:

| | | |
|---|---|---|
| Strand Type | = | PCI 270 |
| Yield Stress, fpu | = | 270. ksi |

Stress-strain curve defined using PCI 270 7-wire Lo-lax equation
If eps > 0.0086 fpu (ksi) = 270 - 0.04/(eps-0.007)

| | | |
|---|---|---|
| Number of Reinforcing Strands | = | 6 |
| Cross-sectional Area of Single Strand | = | 0.153 sq. in. |
| Concrete Cover Thickness Over Strands | = | 2.000 in |

### Prestressing Strand Geometry:

| Strand No. | Diameter in | Area sq. in | X in | Y in |
|---|---|---|---|---|
| 1 | 0.500 | 0.153 | 4.750 | 0.000 |
| 2 | 0.500 | 0.153 | 2.375 | 4.114 |

| | | | | |
|---|---|---|---|---|
| 3 | 0.500 | 0.153 | -2.375 | 4.114 |
| 4 | 0.500 | 0.153 | -4.750 | 0.000 |
| 5 | 0.500 | 0.153 | -2.375 | -4.114 |
| 6 | 0.500 | 0.153 | 2.375 | -4.114 |

Computation of Loss of Prestress:

| | | |
|---|---|---|
| Initial Prestressing Force | = | 146.000 kips |
| Fraction of Loss of Prestress | = | 0.100 |
| Effective Prestressing Force After Losses | = | 131.400 kips |
| Area of Concrete, Ac | = | 195.082 sq.in |
| Area of Steel, As | = | 0.918 sq.in |
| Stress in Concrete After Losses, f_pc | = | 0.674 ksi |
| Stress in Steel After Losses | = | -143.137 ksi |
| Compressive Strain in Concrete After Losses | = | 0.0001526 |
| Tensile Strain in Steel After Losses | = | -0.0051120 |
| Axial Tension Load for Cracking of Concrete | = | -185.012 kips |

Estimated Structural Capacities Computed Using PCI Equations:

| | | |
|---|---|---|
| Nom. Axial Cap., Pn = (0.85 f'c - 0.60 f_pc) Ag | = | 920.389 kips |
| Unfac. Axial Load Cap. N = (0.33 f'c - 0.27 f_pc) Ag | = | 352.435 kips |
| Axial Capacity in Tension, Nt = As fpu | = | -247.860 kips |
| Nom. Moment Capacity, Mn = 0.37 D As fpu | = | 1283.915 in-kip |

Note: The estimate of nominal moment capacity is based on equations that assume compressive strength of concrete is 6,000 psi (41.4 MPa), the value of prestress after losses is 700 psi (4.83 MPa), and axial thrust force is zero. When input values for these factors are different, the estimated value of nominal moment capacity will differ from the capacity computed by LPile and should be considered only as an approximate check.

Concrete Properties:

| | | |
|---|---|---|
| Compressive Strength of Concrete | = | 6000. psi |
| Modulus of Elasticity of Concrete | = | 4415201. psi |
| Modulus of Rupture of Prestressed Concrete | = | -309.838668 psi |
| Compression Strain at Peak Stress | = | 0.002310 |
| Tensile Strain at Fracture of Concrete | = | -0.0000604 |
| Maximum Coarse Aggregate Size | = | 0.750000 in |

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

| Number | Axial Thrust Force kips |
|---|---|
| 1 | 50.000 |

---

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

---

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

| Load No. | Axial Thrust kips | Nominal Mom. Cap. in-kip | Max. Comp. Strain |
|---|---|---|---|

| | | | |
|---|---|---|---|
| 1 | 50.000 | 1440.759 | 0.00300000 |

Note that the values of moment capacity in the table above are not factored by a strength reduction factor (phi-factor).

In ACI 318, the value of the strength reduction factor depends on whether the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to ACI 318, Section 9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

| Axial Load No. | Resist. Factor for Moment | Nominal Moment Cap in-kips | Ult. (Fac) Ax. Thrust kips | Ult. (Fac) Moment Cap in-kips | Bend. Stiff. at Ult Mom kip-in^2 |
|---|---|---|---|---|---|
| 1 | 0.65 | 1441. | 32.500000 | 936.493219 | 6286542. |
| 1 | 0.70 | 1441. | 35.000000 | 1009. | 5209154. |
| 1 | 0.75 | 1441. | 37.500000 | 1081. | 4380143. |

## Layering Correction Equivalent Depths of Soil & Rock Layers

| Layer No. | Top of Layer Below Pile Head ft | Equivalent Top Depth Below Grnd Surf ft | Same Layer Type As Layer Above | Layer is Rock or is Below Rock Layer | F0 Integral for Layer lbs | F1 Integral for Layer lbs |
|---|---|---|---|---|---|---|
| 1 | 0.00 | 0.00 | N.A. | No | 0.00 | 23282. |
| 2 | 5.0000 | 12.9410 | No | No | 23282. | 58800. |
| 3 | 21.0000 | 10.2698 | No | No | 82082. | 123282. |
| 4 | 25.0000 | 35.8874 | No | No | 205364. | 110132. |
| 5 | 40.0000 | 19.0666 | No | No | 315496. | N.A. |

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

## Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs

Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

| Load Case No. | Load Type | Pile-head Deflection inches | Pile-head Rotation radians | Max Shear in Pile lbs | Max Moment in Pile in-lbs |
|---|---|---|---|---|---|
| 1 | 5 | 1.000000 | 0.0000 | 31603. | -1349281. |
| 2 | 4 | 1.000000 | -0.010871 | 20972. | 822622. |

Maximum pile-head deflection = 1.0000000000 inches
Maximum pile-head rotation = -0.0108714982 radians = -0.622891 deg.

The analysis ended normally.

Input Structural Properties for Pile Sections:

Pile Section No. 1:

| | | |
|---|---|---|
| Section 1 is a square prestressed concrete pile | | |
| Length of section | = | 50.000000 ft |
| Pile Width | = | 16.000000 in |
| Corner Chamfer | = | 0.0000 in |
| Shear capacity of section | = | 0.0000 lbs |

## Ground Slope and Pile Batter Angles

| | | |
|---|---|---|
| Ground Slope Angle | = | 0.000 degrees |
| | = | 0.000 radians |
| Pile Batter Angle | = | 0.000 degrees |
| | = | 0.000 radians |

## Soil and Rock Layering Information

The soil profile is modelled using 5 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 0.0000 ft |
| Distance from top of pile to bottom of layer | = | 5.000000 ft |
| Effective unit weight at top of layer | = | 130.000000 pcf |
| Effective unit weight at bottom of layer | = | 130.000000 pcf |
| Friction angle at top of layer | = | 34.000000 deg. |
| Friction angle at bottom of layer | = | 34.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 2 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 5.000000 ft |
| Distance from top of pile to bottom of layer | = | 21.000000 ft |
| Effective unit weight at top of layer | = | 95.000000 pcf |
| Effective unit weight at bottom of layer | = | 100.000000 pcf |

| | | |
|---|---|---|
| Undrained cohesion at top of layer | = | 200.000000 psf |
| Undrained cohesion at bottom of layer | = | 500.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 21.000000 ft |
| Distance from top of pile to bottom of layer | = | 25.000000 ft |
| Effective unit weight at top of layer | = | 120.000000 pcf |
| Effective unit weight at bottom of layer | = | 120.000000 pcf |
| Friction angle at top of layer | = | 30.000000 deg. |
| Friction angle at bottom of layer | = | 30.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 4 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 25.000000 ft |
| Distance from top of pile to bottom of layer | = | 40.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 115.000000 pcf |
| Undrained cohesion at top of layer | = | 600.000000 psf |
| Undrained cohesion at bottom of layer | = | 800.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 5 is cemented silt with cohesion and friction

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 40.000000 ft |
| Distance from top of pile to bottom of layer | = | 70.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 110.000000 pcf |
| Undrained cohesion at top of layer | = | 350.000000 psf |
| Undrained cohesion at bottom of layer | = | 350.000000 psf |
| Friction angle at top of layer | = | 25.000000 deg. |
| Friction angle at bottom of layer | = | 25.000000 deg. |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for Epsilon-50 will be computed for this layer.
NOTE: Default values for subgrade k will be computed for this layer.

(Depth of the lowest soil layer extends 20.000 ft below the pile tip)

---

## Static Loading Type

---

Static loading criteria were used when computing p-y curves for all analyses.

## Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 2

| Load No. | Load Type | Condition 1 | Condition 2 | Axial Thrust Force, lbs |
|---|---|---|---|---|
| 1 | 5 | y = 0.500000 in | S = 0.0000 in/in | 50000. |
| 2 | 4 | y = 0.500000 in | M = 0.0000 in-lbs | 50000. |

V = shear force applied normal to pile axis
M = bending moment applied to pile head
y = lateral deflection normal to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applied to pile head
Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).
Thrust force is assumed to be acting axially for all pile batter angles.

## Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

### Pile Section No. 1:

#### Dimensions of Square Prestressed Pile Section:

| | | |
|---|---|---|
| Length of Section | = | 50.0000 ft |
| Pile Width | = | 16.000 in |
| Corner Chamfer | = | 0.000 in |

#### Prestressing Strand Details:

| | | |
|---|---|---|
| Strand Type | = | PCI 270 |
| Yield Stress, fpu | = | 270. ksi |

Stress-strain curve defined using PCI 270 7-wire Lo-lax equation
If eps > 0.0086 fpu (ksi) = 270 - 0.04/(eps-0.007)

| | | |
|---|---|---|
| Number of Reinforcing Strands | = | 6 |
| Cross-sectional Area of Single Strand | = | 0.153 sq. in. |
| Concrete Cover Thickness Over Strands | = | 2.000 in |

#### Prestressing Strand Geometry:

| Strand No. | Diameter in | Area sq. in | X in | Y in |
|---|---|---|---|---|
| 1 | 0.500 | 0.153 | 5.750 | 0.000 |
| 2 | 0.500 | 0.153 | 2.875 | 4.980 |

| | | | | |
|---|---|---|---|---|
| 3 | 0.500 | 0.153 | -2.875 | 4.980 |
| 4 | 0.500 | 0.153 | -5.750 | 0.000 |
| 5 | 0.500 | 0.153 | -2.875 | -4.980 |
| 6 | 0.500 | 0.153 | 2.875 | -4.980 |

Computation of Loss of Prestress:

| | | |
|---|---|---|
| Initial Prestressing Force | = | 194.564 kips |
| Fraction of Loss of Prestress | = | 0.100 |
| Effective Prestressing Force After Losses | = | 175.108 kips |
| Area of Concrete, Ac | = | 255.082 sq.in |
| Area of Steel, As | = | 0.918 sq.in |
| Stress in Concrete After Losses, f_pc | = | 0.686 ksi |
| Stress in Steel After Losses | = | -190.749 ksi |
| Compressive Strain in Concrete After Losses | = | 0.0001555 |
| Tensile Strain in Steel After Losses | = | -0.0068125 |
| Axial Tension Load for Cracking of Concrete | = | -244.731 kips |

Estimated Structural Capacities Computed Using PCI Equations:

| | | |
|---|---|---|
| Nom. Axial Cap., Pn = (0.85 f'c - 0.60 f_pc) Ag | = | 1200.157 kips |
| Unfac. Axial Load Cap. N = (0.33 f'c - 0.27 f_pc) Ag | = | 459.431 kips |
| Axial Capacity in Tension, Nt = As fpu | = | -247.860 kips |
| Nom. Moment Capacity, Mn = 0.37 D As fpu | = | 1467.331 in-kip |

Note: The estimate of nominal moment capacity is based on equations that assume compressive strength of concrete is 6,000 psi (41.4 MPa), the value of prestress after losses is 700 psi (4.83 MPa), and axial thrust force is zero. When input values for these factors are different, the estimated value of nominal moment capacity will differ from the capacity computed by LPile and should be considered only as an approximate check.

Concrete Properties:

| | | |
|---|---|---|
| Compressive Strength of Concrete | = | 6000. psi |
| Modulus of Elasticity of Concrete | = | 4415201. psi |
| Modulus of Rupture of Prestressed Concrete | = | -309.838668 psi |
| Compression Strain at Peak Stress | = | 0.002310 |
| Tensile Strain at Fracture of Concrete | = | -0.0000604 |
| Maximum Coarse Aggregate Size | = | 0.750000 in |

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

| Number | Axial Thrust Force kips |
|---|---|
| 1 | 50.000 |

---

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

---

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

| Load No. | Axial Thrust kips | Nominal Mom. Cap. in-kip | Max. Comp. Strain |
|---|---|---|---|

| | | | |
|---|---|---|---|
| 1 | 50.000 | 1841.524 | 0.00300000 |

Note that the values of moment capacity in the table above are not factored by a strength reduction factor (phi-factor).

In ACI 318, the value of the strength reduction factor depends on whether the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to ACI 318, Section 9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

| Axial Load No. | Resist. Factor for Moment | Nominal Moment Cap in-kips | Ult. (Fac) Ax. Thrust kips | Ult. (Fac) Moment Cap in-kips | Bend. Stiff. at Ult Mom kip-in^2 |
|---|---|---|---|---|---|
| 1 | 0.65 | 1842. | 32.500000 | 1197. | 13709040. |
| 1 | 0.70 | 1842. | 35.000000 | 1289. | 11400426. |
| 1 | 0.75 | 1842. | 37.500000 | 1381. | 9446900. |

## Layering Correction Equivalent Depths of Soil & Rock Layers

| Layer No. | Top of Layer Below Pile Head ft | Equivalent Top Depth Below Grnd Surf ft | Same Layer Type As Layer Above | Layer is Rock or is Below Rock Layer | F0 Integral for Layer lbs | F1 Integral for Layer lbs |
|---|---|---|---|---|---|---|
| 1 | 0.00 | 0.00 | N.A. | No | 0.00 | 26489. |
| 2 | 5.0000 | 12.9885 | No | No | 26489. | 67200. |
| 3 | 21.0000 | 10.6203 | No | No | 93689. | 132049. |
| 4 | 25.0000 | 34.9605 | No | No | 225739. | 125865. |
| 5 | 40.0000 | 19.6554 | No | No | 351604. | N.A. |

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

## Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs

Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

| Load Case No. | Load Type | Pile-head Deflection inches | Pile-head Rotation radians | Max Shear in Pile lbs | Max Moment in Pile in-lbs |
|---|---|---|---|---|---|
| 1 | 5 | 0.500000 | 0.0000 | 30887. | -1491538. |
| 2 | 4 | 0.500000 | -0.004738 | 19480. | 772437. |

Maximum pile-head deflection = 0.5000000000 inches
Maximum pile-head rotation = -0.0047380436 radians = -0.271470 deg.

The analysis ended normally.

**16 Inch Square Prestressed Concrete Pile**
**1.0 Inch Deflection**

Name of the output report file:
New LPile (USCS units) - 16 inch sq - 1 in def.lp10

Name of the plot output file:
New LPile (USCS units) - 16 inch sq - 1 in def.lp10

Name of the runtime message file:
New LPile (USCS units) - 16 inch sq - 1 in def.lp10

## Date and Time of Analysis

Date: November 21, 2018 Time: 8:59:28

## Problem Title

Project Name: Wastewater Treatment Facility Improvements

Job Number: 7986.01

New LPile (USCS units) - 16 inch sq - 1 in def.lp10o

Client: Carollo Engineers

Engineer: LACO Associates

Description: Lateral Load Analysis - 16-inch square precast concrete

---

## Program Options and Settings

---

Computational Options:
- Use unfactored loads in computations (conventional analysis)

Engineering Units Used for Data Input and Computations:
- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

| | | |
|---|---|---|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 100 |

Loading Type and Number of Cycles of Loading:
- Static loading specified

- Use of p-y modification factors for p-y curves not selected
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
- Output files use decimal points to denote decimal symbols.
- Report only summary tables of pile-head deflection, maximum bending moment, and maximum shear force in output report file.
- No p-y curves to be computed and reported for user-specified depths
- Print using narrow report formats
  (Note: Some output information is omitted from the narrow report formats)

---

## Pile Structural Properties and Geometry

---

| | | |
|---|---|---|
| Number of pile sections defined | = | 1 |
| Total length of pile | = | 50.000 ft |
| Depth of ground surface below top of pile | = | 0.0000 ft |

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

| Point No. | Depth Below Pile Head feet | Pile Diameter inches |
|---|---|---|
| 1 | 0.000 | 16.0000 |
| 2 | 50.000 | 16.0000 |

Input Structural Properties for Pile Sections:

Pile Section No. 1:

| | | |
|---|---|---|
| Section 1 is a square prestressed concrete pile | | |
| Length of section | = | 50.000000 ft |
| Pile Width | = | 16.000000 in |
| Corner Chamfer | = | 0.0000 in |
| Shear capacity of section | = | 0.0000 lbs |

## Ground Slope and Pile Batter Angles

| | | |
|---|---|---|
| Ground Slope Angle | = | 0.000 degrees |
| | = | 0.000 radians |
| Pile Batter Angle | = | 0.000 degrees |
| | = | 0.000 radians |

## Soil and Rock Layering Information

The soil profile is modelled using 5 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 0.0000 ft |
| Distance from top of pile to bottom of layer | = | 5.000000 ft |
| Effective unit weight at top of layer | = | 130.000000 pcf |
| Effective unit weight at bottom of layer | = | 130.000000 pcf |
| Friction angle at top of layer | = | 34.000000 deg. |
| Friction angle at bottom of layer | = | 34.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 2 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 5.000000 ft |
| Distance from top of pile to bottom of layer | = | 21.000000 ft |
| Effective unit weight at top of layer | = | 95.000000 pcf |
| Effective unit weight at bottom of layer | = | 100.000000 pcf |

| | | |
|---|---|---|
| Undrained cohesion at top of layer | = | 200.000000 psf |
| Undrained cohesion at bottom of layer | = | 500.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 21.000000 ft |
| Distance from top of pile to bottom of layer | = | 25.000000 ft |
| Effective unit weight at top of layer | = | 120.000000 pcf |
| Effective unit weight at bottom of layer | = | 120.000000 pcf |
| Friction angle at top of layer | = | 30.000000 deg. |
| Friction angle at bottom of layer | = | 30.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 4 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 25.000000 ft |
| Distance from top of pile to bottom of layer | = | 40.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 115.000000 pcf |
| Undrained cohesion at top of layer | = | 600.000000 psf |
| Undrained cohesion at bottom of layer | = | 800.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 5 is cemented silt with cohesion and friction

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 40.000000 ft |
| Distance from top of pile to bottom of layer | = | 70.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 110.000000 pcf |
| Undrained cohesion at top of layer | = | 350.000000 psf |
| Undrained cohesion at bottom of layer | = | 350.000000 psf |
| Friction angle at top of layer | = | 25.000000 deg. |
| Friction angle at bottom of layer | = | 25.000000 deg. |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for Epsilon-50 will be computed for this layer.
NOTE: Default values for subgrade k will be computed for this layer.

(Depth of the lowest soil layer extends 20.000 ft below the pile tip)

---

## Static Loading Type

---

Static loading criteria were used when computing p-y curves for all analyses.

## Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 2

| Load No. | Load Type | Condition 1 | | Condition 2 | | Axial Thrust Force, lbs |
|---|---|---|---|---|---|---|
| 1 | 5 | y = | 1.000000 in | S = | 0.0000 in/in | 50000. |
| 2 | 4 | y = | 1.000000 in | M = | 0.0000 in-lbs | 50000. |

V = shear force applied normal to pile axis
M = bending moment applied to pile head
y = lateral deflection normal to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applied to pile head
Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).
Thrust force is assumed to be acting axially for all pile batter angles.

## Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

### Pile Section No. 1:

#### Dimensions of Square Prestressed Pile Section:

| | | |
|---|---|---|
| Length of Section | = | 50.0000 ft |
| Pile Width | = | 16.000 in |
| Corner Chamfer | = | 0.000 in |

#### Prestressing Strand Details:

| | | |
|---|---|---|
| Strand Type | = | PCI 270 |
| Yield Stress, fpu | = | 270. ksi |

Stress-strain curve defined using PCI 270 7-wire Lo-lax equation
If eps > 0.0086 fpu (ksi) = 270 - 0.04/(eps-0.007)

| | | |
|---|---|---|
| Number of Reinforcing Strands | = | 6 |
| Cross-sectional Area of Single Strand | = | 0.153 sq. in. |
| Concrete Cover Thickness Over Strands | = | 2.000 in |

#### Prestressing Strand Geometry:

| Strand No. | Diameter in | Area sq. in | X in | Y in |
|---|---|---|---|---|
| 1 | 0.500 | 0.153 | 5.750 | 0.000 |
| 2 | 0.500 | 0.153 | 2.875 | 4.980 |

| | | | | |
|---|---|---|---|---|
| 3 | 0.500 | 0.153 | -2.875 | 4.980 |
| 4 | 0.500 | 0.153 | -5.750 | 0.000 |
| 5 | 0.500 | 0.153 | -2.875 | -4.980 |
| 6 | 0.500 | 0.153 | 2.875 | -4.980 |

Computation of Loss of Prestress:

| | | |
|---|---|---|
| Initial Prestressing Force | = | 194.564 kips |
| Fraction of Loss of Prestress | = | 0.100 |
| Effective Prestressing Force After Losses | = | 175.108 kips |
| Area of Concrete, Ac | = | 255.082 sq.in |
| Area of Steel, As | = | 0.918 sq.in |
| Stress in Concrete After Losses, f_pc | = | 0.686 ksi |
| Stress in Steel After Losses | = | -190.749 ksi |
| Compressive Strain in Concrete After Losses | = | 0.0001555 |
| Tensile Strain in Steel After Losses | = | -0.0068125 |
| Axial Tension Load for Cracking of Concrete | = | -244.731 kips |

Estimated Structural Capacities Computed Using PCI Equations:

| | | |
|---|---|---|
| Nom. Axial Cap., Pn = (0.85 f'c - 0.60 f_pc) Ag | = | 1200.157 kips |
| Unfac. Axial Load Cap. N = (0.33 f'c - 0.27 f_pc) Ag | = | 459.431 kips |
| Axial Capacity in Tension, Nt = As fpu | = | -247.860 kips |
| Nom. Moment Capacity, Mn = 0.37 D As fpu | = | 1467.331 in-kip |

Note: The estimate of nominal moment capacity is based on equations that assume compressive strength of concrete is 6,000 psi (41.4 MPa), the value of prestress after losses is 700 psi (4.83 MPa), and axial thrust force is zero. When input values for these factors are different, the estimated value of nominal moment capacity will differ from the capacity computed by LPile and should be considered only as an approximate check.

Concrete Properties:

| | | |
|---|---|---|
| Compressive Strength of Concrete | = | 6000. psi |
| Modulus of Elasticity of Concrete | = | 4415201. psi |
| Modulus of Rupture of Prestressed Concrete | = | -309.838668 psi |
| Compression Strain at Peak Stress | = | 0.002310 |
| Tensile Strain at Fracture of Concrete | = | -0.0000604 |
| Maximum Coarse Aggregate Size | = | 0.750000 in |

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

| Number | Axial Thrust Force kips |
|---|---|
| 1 | 50.000 |

---

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

---

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

| Load No. | Axial Thrust kips | Nominal Mom. Cap. in-kip | Max. Comp. Strain |
|---|---|---|---|

| | | | |
|---|---|---|---|
| 1 | 50.000 | 1841.524 | 0.00300000 |

Note that the values of moment capacity in the table above are not factored by a strength reduction factor (phi-factor).

In ACI 318, the value of the strength reduction factor depends on whether the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to ACI 318, Section 9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

| Axial Load No. | Resist. Factor for Moment | Nominal Moment Cap in-kips | Ult. (Fac) Ax. Thrust kips | Ult. (Fac) Moment Cap in-kips | Bend. Stiff. at Ult Mom kip-in^2 |
|---|---|---|---|---|---|
| 1 | 0.65 | 1842. | 32.500000 | 1197. | 13709040. |
| 1 | 0.70 | 1842. | 35.000000 | 1289. | 11400426. |
| 1 | 0.75 | 1842. | 37.500000 | 1381. | 9446900. |

## Layering Correction Equivalent Depths of Soil & Rock Layers

| 5 | 40.0000 | 19.6554 | No | No | 351604. | N.A. |

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

## Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs

New LPile (USCS units) - 16 inch sq - 1 in def.lp10o
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

| Load Case No. | Load Type | Pile-head Deflection inches | Pile-head Rotation radians | Max Shear in Pile lbs | Max Moment in Pile in-lbs |
|---|---|---|---|---|---|
| 1 | 5 | 1.000000 | 0.0000 | 38363. | -1773058. |
| 2 | 4 | 1.000000 | -0.009231 | 26120. | 1091685. |

Maximum pile-head deflection = 1.0000000000 inches
Maximum pile-head rotation = -0.0092305829 radians = -0.528873 deg.

The analysis ended normally.

---

## Date and Time of Analysis

---

Date: February 6, 2019 Time: 8:36:49

---

## Problem Title

---

Project Name: Wastewater Treatment Facility Improvements
Job Number: 7986.01
Client: Carollo Engineers
Engineer: LACO Associates
Description: Lateral Load Analysis - 12-inch square precast concrete

---

## Program Options and Settings

---

Computational Options:
- Use unfactored loads in computations (conventional analysis)

Engineering Units Used for Data Input and Computations:
- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

| | | |
|---|---|---|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 100 |

Loading Type and Number of Cycles of Loading:
- Static loading specified

- Use of p-y modification factors for p-y curves not selected
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
 - Output files use decimal points to denote decimal symbols.
 - Report only summary tables of pile-head deflection, maximum bending moment,
   and maximum shear force in output report file.
 - No p-y curves to be computed and reported for user-specified depths
 - Print using narrow report formats
   (Note: Some output information is omitted from the narrow report formats)

---

## Pile Structural Properties and Geometry

---

| | | |
|---|---|---|
| Number of pile sections defined | = | 1 |
| Total length of pile | = | 50.000 ft |
| Depth of ground surface below top of pile | = | 0.0000 ft |

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over
the length of the pile. A summary of values of pile diameter vs. depth follows.

| Point No. | Depth Below Pile Head feet | Pile Diameter inches |
|---|---|---|
| 1 | 0.000 | 12.0000 |
| 2 | 50.000 | 12.0000 |

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a square prestressed concrete pile

| | | |
|---|---|---|
| Length of section | = | 50.000000 ft |
| Pile Width | = | 12.000000 in |
| Corner Chamfer | = | 0.0000 in |
| Shear capacity of section | = | 0.0000 lbs |

---

## Ground Slope and Pile Batter Angles

---

Ground Slope Angle = 0.000 degrees
= 0.000 radians

Pile Batter Angle = 0.000 degrees
= 0.000 radians

---

## Soil and Rock Layering Information

---

The soil profile is modelled using 4 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 0.0000 ft |
| Distance from top of pile to bottom of layer | = | 16.000000 ft |
| Effective unit weight at top of layer | = | 95.000000 pcf |
| Effective unit weight at bottom of layer | = | 100.000000 pcf |
| Undrained cohesion at top of layer | = | 200.000000 psf |
| Undrained cohesion at bottom of layer | = | 500.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 16.000000 ft |
| Distance from top of pile to bottom of layer | = | 20.000000 ft |
| Effective unit weight at top of layer | = | 120.000000 pcf |
| Effective unit weight at bottom of layer | = | 120.000000 pcf |
| Friction angle at top of layer | = | 30.000000 deg. |
| Friction angle at bottom of layer | = | 30.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 3 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 20.000000 ft |
| Distance from top of pile to bottom of layer | = | 35.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 115.000000 pcf |
| Undrained cohesion at top of layer | = | 600.000000 psf |
| Undrained cohesion at bottom of layer | = | 800.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 4 is cemented silt with cohesion and friction

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 35.000000 ft |
| Distance from top of pile to bottom of layer | = | 70.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 110.000000 pcf |
| Undrained cohesion at top of layer | = | 350.000000 psf |
| Undrained cohesion at bottom of layer | = | 350.000000 psf |
| Friction angle at top of layer | = | 25.000000 deg. |
| Friction angle at bottom of layer | = | 25.000000 deg. |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for Epsilon-50 will be computed for this layer.
NOTE: Default values for subgrade k will be computed for this layer.

(Depth of the lowest soil layer extends 20.000 ft below the pile tip)

---

## Static Loading Type

---

Static loading criteria were used when computing p-y curves for all analyses.

---

## Pile-head Loading and Pile-head Fixity Conditions

---

Number of loads specified = 2

| Load No. | Load Type | Condition 1 | Condition 2 | Axial Thrust Force, lbs |
|---|---|---|---|---|
| 1 | 5 | y = 0.500000 in | S = 0.0000 in/in | 50000. |
| 2 | 4 | y = 0.500000 in | M = 0.0000 in-lbs | 50000. |

V = shear force applied normal to pile axis
M = bending moment applied to pile head
y = lateral deflection normal to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applied to pile head
Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).
Thrust force is assumed to be acting axially for all pile batter angles.

---

## Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

---

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

### Pile Section No. 1:

Dimensions of Square Prestressed Pile Section:

| | | |
|---|---|---|
| Length of Section | = | 50.0000 ft |
| Pile Width | = | 12.000 in |
| Corner Chamfer | = | 0.000 in |

Prestressing Strand Details:

| | | |
|---|---|---|
| Strand Type | = | PCI 270 |
| Yield Stress, fpu | = | 270. ksi |
| Elasticity Modulus, Es | = | 28000. ksi |

Stress-strain curve defined using PCI 270 7-wire Lo-lax equation
If eps > 0.0086 fpu (ksi) = 270 - 0.04/(eps-0.007)

| | | |
|---|---|---|
| Number of Reinforcing Strands | = | 6 |
| Cross-sectional Area of Single Strand | = | 0.153 sq. in. |
| Concrete Cover Thickness Over Strands | = | 2.000 in |

Prestressing Strand Geometry:

| Strand No. | Diameter in | Area sq. in | X in | Y in |
|---|---|---|---|---|
| 1 | 0.500 | 0.153 | 3.750 | 0.000 |
| 2 | 0.500 | 0.153 | 1.875 | 3.248 |
| 3 | 0.500 | 0.153 | -1.875 | 3.248 |
| 4 | 0.500 | 0.153 | -3.750 | 0.000 |
| 5 | 0.500 | 0.153 | -1.875 | -3.248 |
| 6 | 0.500 | 0.153 | 1.875 | -3.248 |

Computation of Loss of Prestress:

| | | |
|---|---|---|
| Initial Prestressing Force | = | 146.000 kips |
| Fraction of Loss of Prestress | = | 0.100 |
| Effective Prestressing Force After Losses | = | 131.400 kips |
| Area of Concrete, Ac | = | 143.082 sq.in |
| Area of Steel, As | = | 0.918 sq.in |
| Stress in Concrete After Losses, f_pc | = | 0.918 ksi |
| Stress in Steel After Losses | = | -143.137 ksi |
| Compressive Strain in Concrete After Losses | = | 0.0002080 |
| Tensile Strain in Steel After Losses | = | -0.0051120 |
| Axial Tension Load for Cracking of Concrete | = | -171.135 kips |

Estimated Structural Capacities Computed Using PCI Equations:

| | | |
|---|---|---|
| Nom. Axial Cap., Pn = (0.85 f'c - 0.60 f_pc) Ag | = | 655.054 kips |
| Unfac. Axial Load Cap. N = (0.33 f'c - 0.27 f_pc) Ag | = | 249.414 kips |
| Axial Capacity in Tension, Nt = As fpu | = | -247.860 kips |
| Nom. Moment Capacity, Mn = 0.37 D As fpu | = | 1100.498 in-kip |

Note: The estimate of nominal moment capacity is based on equations that assume compressive strength of concrete is 6,000 psi (41.4 MPa), the value

of prestress after losses is 700 psi (4.83 MPa), and axial thrust force is
zero. When input values for these factors are different, the estimated value
of nominal moment capacity will differ from the capacity computed by LPile
and should be considered only as an approximate check.

Concrete Properties:
---

| | | |
|---|---|---|
| Compressive Strength of Concrete | = | 6000. psi |
| Modulus of Elasticity of Concrete | = | 4415201. psi |
| Modulus of Rupture of Prestressed Concrete | = | -309.838668 psi |
| Compression Strain at Peak Stress | = | 0.002310 |
| Tensile Strain at Fracture of Concrete | = | -0.0000604 |
| Maximum Coarse Aggregate Size | = | 0.750000 in |

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

| Number | Axial Thrust Force kips |
|---|---|
| 1 | 50.000 |

---
Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1
---

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

| Load No. | Axial Thrust kips | Nominal Mom. Cap. in-kip | Max. Comp. Strain |
|---|---|---|---|
| 1 | 50.000 | 1060.461 | 0.00300000 |

Note that the values of moment capacity in the table above are not
factored by a strength reduction factor (phi-factor).

In ACI 318, the value of the strength reduction factor depends on whether
the transverse reinforcing steel bars are tied hoops (0.65) or spirals
(0.70).

The above values should be multiplied by the appropriate strength reduction
factor to compute ultimate moment capacity according to ACI 318, Section

9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

| Axial Load No. | Resist. Factor for Moment | Nominal Moment Cap in-kips | Ult. (Fac) Ax. Thrust kips | Ult. (Fac) Moment Cap in-kips | Bend. Stiff. at Ult Mom kip-in^2 |
|---|---|---|---|---|---|
| 1 | 0.65 | 1060. | 32.500000 | 689.299356 | 4518034. |
| 1 | 0.70 | 1060. | 35.000000 | 742.322383 | 3846872. |
| 1 | 0.75 | 1060. | 37.500000 | 795.345411 | 3272675. |

---

Layering Correction Equivalent Depths of Soil & Rock Layers

---

| Layer No. | Top of Layer Below Pile Head ft | Equivalent Top Depth Below Grnd Surf ft | Same Layer Type As Layer Above | Layer is Rock or is Below Rock Layer | F0 Integral for Layer lbs | F1 Integral for Layer lbs |
|---|---|---|---|---|---|---|
| 1 | 0.00 | 0.00 | N.A. | No | 0.00 | 45056. |
| 2 | 16.0000 | 8.6062 | No | No | 45056. | 86705. |
| 3 | 20.0000 | 27.3853 | No | No | 131761. | 94399. |
| 4 | 35.0000 | 17.2802 | No | No | 226160. | N.A. |

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals
for Layer n. Layering correction equivalent depths are computed only

for soil types with both shallow-depth and deep-depth expressions for
peak lateral load transfer. These soil types are soft and stiff clays,
non-liquefied sands, and cemented c-phi soil.

---

Summary of Pile-head Responses for Conventional Analyses

---

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

| Load Case No. | Load Type | Pile-head Deflection inches | Pile-head Rotation radians | Max Shear in Pile lbs | Max Moment in Pile in-lbs |
|---|---|---|---|---|---|
| 1 | 5 | 0.500000 | 0.0000 | 10797. | -689544. |
| 2 | 4 | 0.500000 | -0.005030 | 5141. | 306572. |

Maximum pile-head deflection = 0.5000000000 inches
Maximum pile-head rotation = -0.0050298991 radians = -0.288192 deg.

The analysis ended normally.

## Soil and Rock Layering Information

---

The soil profile is modelled using 4 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 0.0000 ft |
| Distance from top of pile to bottom of layer | = | 16.000000 ft |
| Effective unit weight at top of layer | = | 95.000000 pcf |
| Effective unit weight at bottom of layer | = | 100.000000 pcf |
| Undrained cohesion at top of layer | = | 200.000000 psf |
| Undrained cohesion at bottom of layer | = | 500.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 16.000000 ft |
| Distance from top of pile to bottom of layer | = | 20.000000 ft |
| Effective unit weight at top of layer | = | 120.000000 pcf |
| Effective unit weight at bottom of layer | = | 120.000000 pcf |
| Friction angle at top of layer | = | 30.000000 deg. |
| Friction angle at bottom of layer | = | 30.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 3 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 20.000000 ft |
| Distance from top of pile to bottom of layer | = | 35.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 115.000000 pcf |
| Undrained cohesion at top of layer | = | 600.000000 psf |
| Undrained cohesion at bottom of layer | = | 800.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 4 is cemented silt with cohesion and friction

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 35.000000 ft |
| Distance from top of pile to bottom of layer | = | 70.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 110.000000 pcf |
| Undrained cohesion at top of layer | = | 350.000000 psf |
| Undrained cohesion at bottom of layer | = | 350.000000 psf |
| Friction angle at top of layer | = | 25.000000 deg. |
| Friction angle at bottom of layer | = | 25.000000 deg. |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for Epsilon-50 will be computed for this layer.
NOTE: Default values for subgrade k will be computed for this layer.

(Depth of the lowest soil layer extends 20.000 ft below the pile tip)

---

## Static Loading Type

---

Static loading criteria were used when computing p-y curves for all analyses.

---

## Pile-head Loading and Pile-head Fixity Conditions

---

Number of loads specified = 2

| Load No. | Load Type | Condition 1 | Condition 2 | Axial Thrust Force, lbs |
|---|---|---|---|---|
| 1 | 5 | y = 1.000000 in | S = 0.0000 in/in | 50000. |
| 2 | 4 | y = 1.000000 in | M = 0.0000 in-lbs | 50000. |

V = shear force applied normal to pile axis
M = bending moment applied to pile head
y = lateral deflection normal to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applied to pile head
Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).
Thrust force is assumed to be acting axially for all pile batter angles.

---

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

---

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions of Square Prestressed Pile Section:

| | | |
|---|---|---|
| Length of Section | = | 50.0000 ft |
| Pile Width | = | 12.000 in |
| Corner Chamfer | = | 0.000 in |

Prestressing Strand Details:

| | | |
|---|---|---|
| Strand Type | = | PCI 270 |
| Yield Stress, fpu | = | 270. ksi |
| Elasticity Modulus, Es | = | 28000. ksi |

Stress-strain curve defined using PCI 270 7-wire Lo-lax equation
If eps > 0.0086 fpu (ksi) = 270 - 0.04/(eps-0.007)

| | | |
|---|---|---|
| Number of Reinforcing Strands | = | 6 |
| Cross-sectional Area of Single Strand | = | 0.153 sq. in. |
| Concrete Cover Thickness Over Strands | = | 2.000 in |

Prestressing Strand Geometry:

| Strand No. | Diameter in | Area sq. in | X in | Y in |
|---|---|---|---|---|
| 1 | 0.500 | 0.153 | 3.750 | 0.000 |
| 2 | 0.500 | 0.153 | 1.875 | 3.248 |
| 3 | 0.500 | 0.153 | -1.875 | 3.248 |
| 4 | 0.500 | 0.153 | -3.750 | 0.000 |
| 5 | 0.500 | 0.153 | -1.875 | -3.248 |
| 6 | 0.500 | 0.153 | 1.875 | -3.248 |

Computation of Loss of Prestress:

| | | |
|---|---|---|
| Initial Prestressing Force | = | 146.000 kips |
| Fraction of Loss of Prestress | = | 0.100 |
| Effective Prestressing Force After Losses | = | 131.400 kips |
| Area of Concrete, Ac | = | 143.082 sq.in |
| Area of Steel, As | = | 0.918 sq.in |
| Stress in Concrete After Losses, f_pc | = | 0.918 ksi |
| Stress in Steel After Losses | = | -143.137 ksi |
| Compressive Strain in Concrete After Losses | = | 0.0002080 |
| Tensile Strain in Steel After Losses | = | -0.0051120 |
| Axial Tension Load for Cracking of Concrete | = | -171.135 kips |

Estimated Structural Capacities Computed Using PCI Equations:

| | | |
|---|---|---|
| Nom. Axial Cap., Pn = (0.85 f'c - 0.60 f_pc) Ag | = | 655.054 kips |
| Unfac. Axial Load Cap. N = (0.33 f'c - 0.27 f_pc) Ag | = | 249.414 kips |
| Axial Capacity in Tension, Nt = As fpu | = | -247.860 kips |
| Nom. Moment Capacity, Mn = 0.37 D As fpu | = | 1100.498 in-kip |

Note: The estimate of nominal moment capacity is based on equations that assume compressive strength of concrete is 6,000 psi (41.4 MPa), the value

of prestress after losses is 700 psi (4.83 MPa), and axial thrust force is
zero. When input values for these factors are different, the estimated value
of nominal moment capacity will differ from the capacity computed by LPile
and should be considered only as an approximate check.

Concrete Properties:
---

| | | |
|---|---|---|
| Compressive Strength of Concrete | = | 6000. psi |
| Modulus of Elasticity of Concrete | = | 4415201. psi |
| Modulus of Rupture of Prestressed Concrete | = | -309.838668 psi |
| Compression Strain at Peak Stress | = | 0.002310 |
| Tensile Strain at Fracture of Concrete | = | -0.0000604 |
| Maximum Coarse Aggregate Size | = | 0.750000 in |

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

| Number | Axial Thrust Force kips |
|---|---|
| 1 | 50.000 |

---
Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1
---

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

| Load No. | Axial Thrust kips | Nominal Mom. Cap. in-kip | Max. Comp. Strain |
|---|---|---|---|
| 1 | 50.000 | 1060.461 | 0.00300000 |

Note that the values of moment capacity in the table above are not
factored by a strength reduction factor (phi-factor).

In ACI 318, the value of the strength reduction factor depends on whether
the transverse reinforcing steel bars are tied hoops (0.65) or spirals
(0.70).

The above values should be multiplied by the appropriate strength reduction
factor to compute ultimate moment capacity according to ACI 318, Section

9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

| Axial Load No. | Resist. Factor for Moment | Nominal Moment Cap in-kips | Ult. (Fac) Ax. Thrust kips | Ult. (Fac) Moment Cap in-kips | Bend. Stiff. at Ult Mom kip-in^2 |
|---|---|---|---|---|---|
| 1 | 0.65 | 1060. | 32.500000 | 689.299356 | 4518034. |
| 1 | 0.70 | 1060. | 35.000000 | 742.322383 | 3846872. |
| 1 | 0.75 | 1060. | 37.500000 | 795.345411 | 3272675. |

---

Layering Correction Equivalent Depths of Soil & Rock Layers

---

| Layer No. | Top of Layer Below Pile Head ft | Equivalent Top Depth Below Grnd Surf ft | Same Layer Type As Layer Above | Layer is Rock or is Below Rock Layer | F0 Integral for Layer lbs | F1 Integral for Layer lbs |
|---|---|---|---|---|---|---|
| 1 | 0.00 | 0.00 | N.A. | No | 0.00 | 45056. |
| 2 | 16.0000 | 8.6062 | No | No | 45056. | 86705. |
| 3 | 20.0000 | 27.3853 | No | No | 131761. | 94399. |
| 4 | 35.0000 | 17.2802 | No | No | 226160. | N.A. |

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals
for Layer n. Layering correction equivalent depths are computed only

for soil types with both shallow-depth and deep-depth expressions for
peak lateral load transfer. These soil types are soft and stiff clays,
non-liquefied sands, and cemented c-phi soil.

---

Summary of Pile-head Responses for Conventional Analyses

---

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

| Load Case No. | Load Type | Pile-head Deflection inches | Pile-head Rotation radians | Max Shear in Pile lbs | Max Moment in Pile in-lbs |
|---|---|---|---|---|---|
| 1 | 5 | 1.000000 | 0.0000 | 14475. | -902484. |
| 2 | 4 | 1.000000 | -0.009166 | 7486. | 496293. |

Maximum pile-head deflection = 1.0000000000 inches
Maximum pile-head rotation = -0.0091662920 radians = -0.525190 deg.

The analysis ended normally.

---

## Date and Time of Analysis

---

Date: January 23, 2019 Time: 14:56:22

---

## Problem Title

---

Project Name: Wastewater Treatment Facility Improvements
Job Number: 7986.01
Client: Carollo Engineers
Engineer: LACO Associates
Description: Lateral Load Analysis - 14-inch square precast concrete

---

## Program Options and Settings

---

Computational Options:
- Use unfactored loads in computations (conventional analysis)

Engineering Units Used for Data Input and Computations:
- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

| | | |
|---|---|---|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 100 |

Loading Type and Number of Cycles of Loading:
- Static loading specified

- Use of p-y modification factors for p-y curves not selected
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
 - Output files use decimal points to denote decimal symbols.
 - Report only summary tables of pile-head deflection, maximum bending moment,
   and maximum shear force in output report file.
 - No p-y curves to be computed and reported for user-specified depths
 - Print using narrow report formats
   (Note: Some output information is omitted from the narrow report formats)

---

## Pile Structural Properties and Geometry

---

| | | |
|---|---|---|
| Number of pile sections defined | = | 1 |
| Total length of pile | = | 50.000 ft |
| Depth of ground surface below top of pile | = | 0.0000 ft |

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over
the length of the pile. A summary of values of pile diameter vs. depth follows.

| Point No. | Depth Below Pile Head feet | Pile Diameter inches |
|---|---|---|
| 1 | 0.000 | 14.0000 |
| 2 | 50.000 | 14.0000 |

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a square prestressed concrete pile

| | | |
|---|---|---|
| Length of section | = | 50.000000 ft |
| Pile Width | = | 14.000000 in |
| Corner Chamfer | = | 0.0000 in |
| Shear capacity of section | = | 0.0000 lbs |

---

## Ground Slope and Pile Batter Angles

---

Ground Slope Angle = 0.000 degrees
= 0.000 radians

Pile Batter Angle = 0.000 degrees
= 0.000 radians

---

## Soil and Rock Layering Information

---

The soil profile is modelled using 4 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 0.0000 ft |
| Distance from top of pile to bottom of layer | = | 16.000000 ft |
| Effective unit weight at top of layer | = | 95.000000 pcf |
| Effective unit weight at bottom of layer | = | 100.000000 pcf |
| Undrained cohesion at top of layer | = | 200.000000 psf |
| Undrained cohesion at bottom of layer | = | 500.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 16.000000 ft |
| Distance from top of pile to bottom of layer | = | 20.000000 ft |
| Effective unit weight at top of layer | = | 120.000000 pcf |
| Effective unit weight at bottom of layer | = | 120.000000 pcf |
| Friction angle at top of layer | = | 30.000000 deg. |
| Friction angle at bottom of layer | = | 30.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 3 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 20.000000 ft |
| Distance from top of pile to bottom of layer | = | 35.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 115.000000 pcf |
| Undrained cohesion at top of layer | = | 600.000000 psf |
| Undrained cohesion at bottom of layer | = | 800.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 4 is cemented silt with cohesion and friction

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 35.000000 ft |
| Distance from top of pile to bottom of layer | = | 70.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 110.000000 pcf |
| Undrained cohesion at top of layer | = | 350.000000 psf |
| Undrained cohesion at bottom of layer | = | 350.000000 psf |
| Friction angle at top of layer | = | 25.000000 deg. |
| Friction angle at bottom of layer | = | 25.000000 deg. |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for Epsilon-50 will be computed for this layer.
NOTE: Default values for subgrade k will be computed for this layer.

(Depth of the lowest soil layer extends 20.000 ft below the pile tip)

---

## Static Loading Type

---

Static loading criteria were used when computing p-y curves for all analyses.

---

## Pile-head Loading and Pile-head Fixity Conditions

---

Number of loads specified = 2

| Load No. | Load Type | Condition 1 | Condition 2 | Axial Thrust Force, lbs |
|---|---|---|---|---|
| 1 | 5 | y = 0.500000 in | S = 0.0000 in/in | 50000. |
| 2 | 4 | y = 0.500000 in | M = 0.0000 in-lbs | 50000. |

V = shear force applied normal to pile axis
M = bending moment applied to pile head
y = lateral deflection normal to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applied to pile head
Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).
Thrust force is assumed to be acting axially for all pile batter angles.

---

## Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

---

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

### Pile Section No. 1:

#### Dimensions of Square Prestressed Pile Section:

| | | |
|---|---|---|
| Length of Section | = | 50.0000 ft |
| Pile Width | = | 14.000 in |
| Corner Chamfer | = | 0.000 in |

#### Prestressing Strand Details:

| | | |
|---|---|---|
| Strand Type | = | PCI 270 |
| Yield Stress, fpu | = | 270. ksi |
| Elasticity Modulus, Es | = | 28000. ksi |

Stress-strain curve defined using PCI 270 7-wire Lo-lax equation
If eps > 0.0086 fpu (ksi) = 270 - 0.04/(eps-0.007)

| | | |
|---|---|---|
| Number of Reinforcing Strands | = | 6 |
| Cross-sectional Area of Single Strand | = | 0.153 sq. in. |
| Concrete Cover Thickness Over Strands | = | 2.000 in |

Prestressing Strand Geometry:

| Strand No. | Diameter in | Area sq. in | X in | Y in |
|---|---|---|---|---|
| 1 | 0.500 | 0.153 | 4.750 | 0.000 |
| 2 | 0.500 | 0.153 | 2.375 | 4.114 |
| 3 | 0.500 | 0.153 | -2.375 | 4.114 |
| 4 | 0.500 | 0.153 | -4.750 | 0.000 |
| 5 | 0.500 | 0.153 | -2.375 | -4.114 |
| 6 | 0.500 | 0.153 | 2.375 | -4.114 |

Computation of Loss of Prestress:

| | | |
|---|---|---|
| Initial Prestressing Force | = | 146.000 kips |
| Fraction of Loss of Prestress | = | 0.100 |
| Effective Prestressing Force After Losses | = | 131.400 kips |
| Area of Concrete, Ac | = | 195.082 sq.in |
| Area of Steel, As | = | 0.918 sq.in |
| Stress in Concrete After Losses, f_pc | = | 0.674 ksi |
| Stress in Steel After Losses | = | -143.137 ksi |
| Compressive Strain in Concrete After Losses | = | 0.0001526 |
| Tensile Strain in Steel After Losses | = | -0.0051120 |
| Axial Tension Load for Cracking of Concrete | = | -185.012 kips |

Estimated Structural Capacities Computed Using PCI Equations:

| | | |
|---|---|---|
| Nom. Axial Cap., Pn = (0.85 f'c - 0.60 f_pc) Ag | = | 920.389 kips |
| Unfac. Axial Load Cap. N = (0.33 f'c - 0.27 f_pc) Ag | = | 352.435 kips |
| Axial Capacity in Tension, Nt = As fpu | = | -247.860 kips |
| Nom. Moment Capacity, Mn = 0.37 D As fpu | = | 1283.915 in-kip |

Note: The estimate of nominal moment capacity is based on equations that assume compressive strength of concrete is 6,000 psi (41.4 MPa), the value

of prestress after losses is 700 psi (4.83 MPa), and axial thrust force is
zero. When input values for these factors are different, the estimated value
of nominal moment capacity will differ from the capacity computed by LPile
and should be considered only as an approximate check.

Concrete Properties:
---

| | | |
|---|---|---|
| Compressive Strength of Concrete | = | 6000. psi |
| Modulus of Elasticity of Concrete | = | 4415201. psi |
| Modulus of Rupture of Prestressed Concrete | = | -309.838668 psi |
| Compression Strain at Peak Stress | = | 0.002310 |
| Tensile Strain at Fracture of Concrete | = | -0.0000604 |
| Maximum Coarse Aggregate Size | = | 0.750000 in |

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

| Number | Axial Thrust Force kips |
|---|---|
| 1 | 50.000 |

---
Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1
---

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

| Load No. | Axial Thrust kips | Nominal Mom. Cap. in-kip | Max. Comp. Strain |
|---|---|---|---|
| 1 | 50.000 | 1440.759 | 0.00300000 |

Note that the values of moment capacity in the table above are not
factored by a strength reduction factor (phi-factor).

In ACI 318, the value of the strength reduction factor depends on whether
the transverse reinforcing steel bars are tied hoops (0.65) or spirals
(0.70).

The above values should be multiplied by the appropriate strength reduction
factor to compute ultimate moment capacity according to ACI 318, Section

9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

| Axial Load No. | Resist. Factor for Moment | Nominal Moment Cap in-kips | Ult. (Fac) Ax. Thrust kips | Ult. (Fac) Moment Cap in-kips | Bend. Stiff. at Ult Mom kip-in^2 |
|---|---|---|---|---|---|
| 1 | 0.65 | 1441. | 32.500000 | 936.493219 | 6286542. |
| 1 | 0.70 | 1441. | 35.000000 | 1009. | 5209154. |

Layering Correction Equivalent Depths of Soil & Rock Layers

---

| Layer No. | Top of Layer Below Pile Head ft | Equivalent Top Depth Below Grnd Surf ft | Same Layer Type As Layer Above | Layer is Rock or is Below Rock Layer | F0 Integral for Layer lbs | F1 Integral for Layer lbs |
|---|---|---|---|---|---|---|
| 1 | 0.00 | 0.00 | N.A. | No | 0.00 | 51729. |
| 2 | 16.0000 | 8.8912 | No | No | 51729. | 92802. |
| 3 | 20.0000 | 26.2828 | No | No | 144532. | 110132. |
| 4 | 35.0000 | 17.8506 | No | No | 254663. | N.A. |

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals
for Layer n. Layering correction equivalent depths are computed only

for soil types with both shallow-depth and deep-depth expressions for
peak lateral load transfer. These soil types are soft and stiff clays,
non-liquefied sands, and cemented c-phi soil.

---

Summary of Pile-head Responses for Conventional Analyses

---

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

| Load Case No. | Load Type | Pile-head Deflection inches | Pile-head Rotation radians | Max Shear in Pile lbs | Max Moment in Pile in-lbs |
|---|---|---|---|---|---|
| 1 | 5 | 0.500000 | 0.0000 | 13781. | -941634. |
| 2 | 4 | 0.500000 | -0.004434 | 6848. | 458510. |

Maximum pile-head deflection = 0.5000000000 inches
Maximum pile-head rotation = -0.0044343987 radians = -0.254072 deg.

The analysis ended normally.

## Date and Time of Analysis

---

Date: January 23, 2019 Time: 14:59:07

---

## Problem Title

---

Project Name: Wastewater Treatment Facility Improvements
Job Number: 7986.01
Client: Carollo Engineers
Engineer: LACO Associates
Description: Lateral Load Analysis - 14-inch square precast concrete

---

## Program Options and Settings

---

Computational Options:
- Use unfactored loads in computations (conventional analysis)

Engineering Units Used for Data Input and Computations:
- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

| | | |
|---|---|---|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 100 |

Loading Type and Number of Cycles of Loading:
- Static loading specified

- Use of p-y modification factors for p-y curves not selected
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
 - Output files use decimal points to denote decimal symbols.
 - Report only summary tables of pile-head deflection, maximum bending moment,
   and maximum shear force in output report file.
 - No p-y curves to be computed and reported for user-specified depths
 - Print using narrow report formats
   (Note: Some output information is omitted from the narrow report formats)

---

## Pile Structural Properties and Geometry

---

| | | |
|---|---|---|
| Number of pile sections defined | = | 1 |
| Total length of pile | = | 50.000 ft |
| Depth of ground surface below top of pile | = | 0.0000 ft |

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over
the length of the pile. A summary of values of pile diameter vs. depth follows.

| Point No. | Depth Below Pile Head feet | Pile Diameter inches |
|---|---|---|
| 1 | 0.000 | 14.0000 |
| 2 | 50.000 | 14.0000 |

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a square prestressed concrete pile

| | | |
|---|---|---|
| Length of section | = | 50.000000 ft |
| Pile Width | = | 14.000000 in |
| Corner Chamfer | = | 0.0000 in |
| Shear capacity of section | = | 0.0000 lbs |

---

## Ground Slope and Pile Batter Angles

---

Ground Slope Angle = 0.000 degrees
= 0.000 radians

Pile Batter Angle = 0.000 degrees
= 0.000 radians

---

## Soil and Rock Layering Information

---

The soil profile is modelled using 4 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 0.0000 ft |
| Distance from top of pile to bottom of layer | = | 16.000000 ft |
| Effective unit weight at top of layer | = | 95.000000 pcf |
| Effective unit weight at bottom of layer | = | 100.000000 pcf |
| Undrained cohesion at top of layer | = | 200.000000 psf |
| Undrained cohesion at bottom of layer | = | 500.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 16.000000 ft |
| Distance from top of pile to bottom of layer | = | 20.000000 ft |
| Effective unit weight at top of layer | = | 120.000000 pcf |
| Effective unit weight at bottom of layer | = | 120.000000 pcf |
| Friction angle at top of layer | = | 30.000000 deg. |
| Friction angle at bottom of layer | = | 30.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 3 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 20.000000 ft |
| Distance from top of pile to bottom of layer | = | 35.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 115.000000 pcf |
| Undrained cohesion at top of layer | = | 600.000000 psf |
| Undrained cohesion at bottom of layer | = | 800.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 4 is cemented silt with cohesion and friction

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 35.000000 ft |
| Distance from top of pile to bottom of layer | = | 70.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 110.000000 pcf |
| Undrained cohesion at top of layer | = | 350.000000 psf |
| Undrained cohesion at bottom of layer | = | 350.000000 psf |
| Friction angle at top of layer | = | 25.000000 deg. |
| Friction angle at bottom of layer | = | 25.000000 deg. |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for Epsilon-50 will be computed for this layer.
NOTE: Default values for subgrade k will be computed for this layer.

(Depth of the lowest soil layer extends 20.000 ft below the pile tip)

---

## Static Loading Type

---

Static loading criteria were used when computing p-y curves for all analyses.

---

## Pile-head Loading and Pile-head Fixity Conditions

---

Number of loads specified = 2

| Load No. | Load Type | Condition 1 | Condition 2 | Axial Thrust Force, lbs |
|---|---|---|---|---|
| 1 | 5 | y = 1.000000 in | S = 0.0000 in/in | 50000. |
| 2 | 4 | y = 1.000000 in | M = 0.0000 in-lbs | 50000. |

V = shear force applied normal to pile axis
M = bending moment applied to pile head
y = lateral deflection normal to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applied to pile head
Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).
Thrust force is assumed to be acting axially for all pile batter angles.

---

## Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

---

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

### Pile Section No. 1:

#### Dimensions of Square Prestressed Pile Section:

| | | |
|---|---|---|
| Length of Section | = | 50.0000 ft |
| Pile Width | = | 14.000 in |
| Corner Chamfer | = | 0.000 in |

#### Prestressing Strand Details:

| | | |
|---|---|---|
| Strand Type | = | PCI 270 |
| Yield Stress, fpu | = | 270. ksi |
| Elasticity Modulus, Es | = | 28000. ksi |

Stress-strain curve defined using PCI 270 7-wire Lo-lax equation
If eps > 0.0086 fpu (ksi) = 270 - 0.04/(eps-0.007)

| | | |
|---|---|---|
| Number of Reinforcing Strands | = | 6 |
| Cross-sectional Area of Single Strand | = | 0.153 sq. in. |
| Concrete Cover Thickness Over Strands | = | 2.000 in |

Prestressing Strand Geometry:

| Strand No. | Diameter in | Area sq. in | X in | Y in |
|---|---|---|---|---|
| 1 | 0.500 | 0.153 | 4.750 | 0.000 |
| 2 | 0.500 | 0.153 | 2.375 | 4.114 |
| 3 | 0.500 | 0.153 | -2.375 | 4.114 |
| 4 | 0.500 | 0.153 | -4.750 | 0.000 |
| 5 | 0.500 | 0.153 | -2.375 | -4.114 |
| 6 | 0.500 | 0.153 | 2.375 | -4.114 |

Computation of Loss of Prestress:

| | | |
|---|---|---|
| Initial Prestressing Force | = | 146.000 kips |
| Fraction of Loss of Prestress | = | 0.100 |
| Effective Prestressing Force After Losses | = | 131.400 kips |
| Area of Concrete, Ac | = | 195.082 sq.in |
| Area of Steel, As | = | 0.918 sq.in |
| Stress in Concrete After Losses, f_pc | = | 0.674 ksi |
| Stress in Steel After Losses | = | -143.137 ksi |
| Compressive Strain in Concrete After Losses | = | 0.0001526 |
| Tensile Strain in Steel After Losses | = | -0.0051120 |
| Axial Tension Load for Cracking of Concrete | = | -185.012 kips |

Estimated Structural Capacities Computed Using PCI Equations:

| | | |
|---|---|---|
| Nom. Axial Cap., Pn = (0.85 f'c - 0.60 f_pc) Ag | = | 920.389 kips |
| Unfac. Axial Load Cap. N = (0.33 f'c - 0.27 f_pc) Ag | = | 352.435 kips |
| Axial Capacity in Tension, Nt = As fpu | = | -247.860 kips |
| Nom. Moment Capacity, Mn = 0.37 D As fpu | = | 1283.915 in-kip |

Note: The estimate of nominal moment capacity is based on equations that assume compressive strength of concrete is 6,000 psi (41.4 MPa), the value

of prestress after losses is 700 psi (4.83 MPa), and axial thrust force is
zero. When input values for these factors are different, the estimated value
of nominal moment capacity will differ from the capacity computed by LPile
and should be considered only as an approximate check.

Concrete Properties:
---

| | | |
|---|---|---|
| Compressive Strength of Concrete | = | 6000. psi |
| Modulus of Elasticity of Concrete | = | 4415201. psi |
| Modulus of Rupture of Prestressed Concrete | = | -309.838668 psi |
| Compression Strain at Peak Stress | = | 0.002310 |
| Tensile Strain at Fracture of Concrete | = | -0.0000604 |
| Maximum Coarse Aggregate Size | = | 0.750000 in |

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

| Number | Axial Thrust Force kips |
|---|---|
| 1 | 50.000 |

---
Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1
---

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

| Load No. | Axial Thrust kips | Nominal Mom. Cap. in-kip | Max. Comp. Strain |
|---|---|---|---|
| 1 | 50.000 | 1440.759 | 0.00300000 |

Note that the values of moment capacity in the table above are not
factored by a strength reduction factor (phi-factor).

In ACI 318, the value of the strength reduction factor depends on whether
the transverse reinforcing steel bars are tied hoops (0.65) or spirals
(0.70).

The above values should be multiplied by the appropriate strength reduction
factor to compute ultimate moment capacity according to ACI 318, Section

9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

| Axial Load No. | Resist. Factor for Moment | Nominal Moment Cap in-kips | Ult. (Fac) Ax. Thrust kips | Ult. (Fac) Moment Cap in-kips | Bend. Stiff. at Ult Mom kip-in^2 |
|---|---|---|---|---|---|
| 1 | 0.65 | 1441. | 32.500000 | 936.493219 | 6286542. |
| 1 | 0.70 | 1441. | 35.000000 | 1009. | 5209154. |
| 1 | 0.75 | 1441. | 37.500000 | 1081. | 4380143. |

---

Layering Correction Equivalent Depths of Soil & Rock Layers

---

| Layer No. | Top of Layer Below Pile Head ft | Equivalent Top Depth Below Grnd Surf ft | Same Layer Type As Layer Above | Layer is Rock or is Below Rock Layer | F0 Integral for Layer lbs | F1 Integral for Layer lbs |
|---|---|---|---|---|---|---|
| 1 | 0.00 | 0.00 | N.A. | No | 0.00 | 51729. |
| 2 | 16.0000 | 8.8912 | No | No | 51729. | 92802. |
| 3 | 20.0000 | 26.2828 | No | No | 144532. | 110132. |
| 4 | 35.0000 | 17.8506 | No | No | 254663. | N.A. |

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals
for Layer n. Layering correction equivalent depths are computed only

for soil types with both shallow-depth and deep-depth expressions for
peak lateral load transfer. These soil types are soft and stiff clays,
non-liquefied sands, and cemented c-phi soil.

---

Summary of Pile-head Responses for Conventional Analyses

---

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

| Load Case No. | Load Type | Pile-head Deflection inches | Pile-head Rotation radians | Max Shear in Pile lbs | Max Moment in Pile in-lbs |
|---|---|---|---|---|---|
| 1 | 5 | 1.000000 | 0.0000 | 18226. | -1202381. |
| 2 | 4 | 1.000000 | -0.008239 | 9612. | 698730. |

Maximum pile-head deflection = 1.0000000000 inches
Maximum pile-head rotation = -0.0082394794 radians = -0.472087 deg.

The analysis ended normally.

Pile Structural Properties and Geometry

---

Number of pile sections defined = 1
Total length of pile = 50.000 ft
Depth of ground surface below top of pile = 0.0000 ft

Pile diameters used for p-y curve computations are defined using 2
points.

p-y curves are computed using pile diameter values interpolated with
depth over
the length of the pile. A summary of values of pile diameter vs. depth
follows.

| Point No. | Depth Below Pile Head feet | Pile Diameter inches |
|---|---|---|
| 1 | 0.000 | 16.0000 |
| 2 | 50.000 | 16.0000 |

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a square prestressed concrete pile
Length of section = 50.000000 ft
Pile Width = 16.000000 in
Corner Chamfer = 0.0000 in
Shear capacity of section = 0.0000 lbs

---

## Ground Slope and Pile Batter Angles

---

Ground Slope Angle = 0.000 degrees
= 0.000 radians

Pile Batter Angle = 0.000 degrees
= 0.000 radians

---

## Soil and Rock Layering Information

---

The soil profile is modelled using 4 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 0.0000 ft |
| Distance from top of pile to bottom of layer | = | 16.000000 ft |
| Effective unit weight at top of layer | = | 95.000000 pcf |
| Effective unit weight at bottom of layer | = | 100.000000 pcf |
| Undrained cohesion at top of layer | = | 200.000000 psf |
| Undrained cohesion at bottom of layer | = | 500.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 16.000000 ft |
| Distance from top of pile to bottom of layer | = | 20.000000 ft |
| Effective unit weight at top of layer | = | 120.000000 pcf |
| Effective unit weight at bottom of layer | = | 120.000000 pcf |
| Friction angle at top of layer | = | 30.000000 deg. |
| Friction angle at bottom of layer | = | 30.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 3 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 20.000000 ft |
| Distance from top of pile to bottom of layer | = | 35.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 115.000000 pcf |
| Undrained cohesion at top of layer | = | 600.000000 psf |
| Undrained cohesion at bottom of layer | = | 800.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 4 is cemented silt with cohesion and friction

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 35.000000 ft |
| Distance from top of pile to bottom of layer | = | 70.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 110.000000 pcf |
| Undrained cohesion at top of layer | = | 350.000000 psf |
| Undrained cohesion at bottom of layer | = | 350.000000 psf |
| Friction angle at top of layer | = | 25.000000 deg. |
| Friction angle at bottom of layer | = | 25.000000 deg. |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for Epsilon-50 will be computed for this layer.
NOTE: Default values for subgrade k will be computed for this layer.

(Depth of the lowest soil layer extends 20.000 ft below the pile tip)

---

## Static Loading Type

---

Static loading criteria were used when computing p-y curves for all analyses.

---

## Pile-head Loading and Pile-head Fixity Conditions

---

Number of loads specified = 2

| Load No. | Load Type | Condition 1 | Condition 2 | Axial Thrust Force, lbs |
|---|---|---|---|---|
| 1 | 5 | y = 0.500000 in | S = 0.0000 in/in | 50000. |
| 2 | 4 | y = 0.500000 in | M = 0.0000 in-lbs | 50000. |

V = shear force applied normal to pile axis
M = bending moment applied to pile head
y = lateral deflection normal to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applied to pile head
Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).
Thrust force is assumed to be acting axially for all pile batter angles.

---

## Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

---

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

### Pile Section No. 1:

#### Dimensions of Square Prestressed Pile Section:

| | | |
|---|---|---|
| Length of Section | = | 50.0000 ft |
| Pile Width | = | 16.000 in |
| Corner Chamfer | = | 0.000 in |

#### Prestressing Strand Details:

| | | |
|---|---|---|
| Strand Type | = | PCI 270 |
| Yield Stress, fpu | = | 270. ksi |
| Elasticity Modulus, Es | = | 28000. ksi |

Stress-strain curve defined using PCI 270 7-wire Lo-lax equation
If eps > 0.0086 fpu (ksi) = 270 - 0.04/(eps-0.007)
Number of Reinforcing Strands = 8
Cross-sectional Area of Single Strand = 0.153 sq. in.
Concrete Cover Thickness Over Strands = 2.000 in

Prestressing Strand Geometry:
---

| Strand No. | Diameter in | Area sq. in | X in | Y in |
|---|---|---|---|---|
| 1 | 0.500 | 0.153 | 5.750 | 0.000 |
| 2 | 0.500 | 0.153 | 4.066 | 4.066 |
| 3 | 0.500 | 0.153 | 0.000 | 5.750 |
| 4 | 0.500 | 0.153 | -4.066 | 4.066 |
| 5 | 0.500 | 0.153 | -5.750 | 0.000 |
| 6 | 0.500 | 0.153 | -4.066 | -4.066 |
| 7 | 0.500 | 0.153 | -0.000 | -5.750 |
| 8 | 0.500 | 0.153 | 4.066 | -4.066 |

Computation of Loss of Prestress:
---

Initial Prestressing Force = 194.564 kips
Fraction of Loss of Prestress = 0.100
Effective Prestressing Force After Losses = 175.108 kips
Area of Concrete, Ac = 254.776 sq.in
Area of Steel, As = 1.224 sq.in
Stress in Concrete After Losses, f_pc = 0.687 ksi
Stress in Steel After Losses = -143.062 ksi
Compressive Strain in Concrete After Losses = 0.0001557
Tensile Strain in Steel After Losses = -0.0051093
Axial Tension Load for Cracking of Concrete = -245.167 kips

Estimated Structural Capacities Computed Using PCI Equations:
---

Nom. Axial Cap., Pn = (0.85 f'c - 0.60 f_pc) Ag = 1200.031 kips
Unfac. Axial Load Cap. N = (0.33 f'c - 0.27 f_pc) Ag = 459.374 kips
Axial Capacity in Tension, Nt = As fpu = -330.480 kips
Nom. Moment Capacity, Mn = 0.37 D As fpu = 1956.442 in-kip

Note: The estimate of nominal moment capacity is based on equations that

assume compressive strength of concrete is 6,000 psi (41.4 MPa), the value
of prestress after losses is 700 psi (4.83 MPa), and axial thrust force is
zero. When input values for these factors are different, the estimated value
of nominal moment capacity will differ from the capacity computed by LPile
and should be considered only as an approximate check.

Concrete Properties:
---

| | | |
|---|---|---|
| Compressive Strength of Concrete | = | 6000. psi |
| Modulus of Elasticity of Concrete | = | 4415201. psi |
| Modulus of Rupture of Prestressed Concrete | = | -309.838668 psi |
| Compression Strain at Peak Stress | = | 0.002310 |
| Tensile Strain at Fracture of Concrete | = | -0.0000604 |
| Maximum Coarse Aggregate Size | = | 0.750000 in |

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

| Number | Axial Thrust Force kips |
|---|---|
| 1 | 50.000 |

Definitions of Run Messages and Notes:
---

C = concrete in section has cracked in tension.
Y = stress in reinforcing steel has reached yield stress.
T = ACI 318 criteria for tension-controlled section met, tensile strain in
reinforcement exceeds 0.005 while simultaneously compressive strain in
concrete more than 0.003. See ACI 318, Section 10.3.4.
Z = depth of tensile zone in concrete section is less than 10 percent of
section depth.

Bending Stiffness (EI) = Computed Bending Moment / Curvature.
Position of neutral axis is measured from edge of compression side of pile.
Compressive stresses and strains are positive in sign.
Tensile stresses and strains are negative in sign.

Axial Thrust Force = 50.000 kips

| Bending Curvature rad/in. | Bending Moment in-kip | Bending Stiffness kip-in2 | Depth to N Axis in | Run Msg |

---

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

---

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

| Load No. | Axial Thrust kips | Nominal Mom. Cap. in-kip | Max. Comp. Strain |
|---|---|---|---|
| 1 | 50.000 | 2140.838 | 0.00300000 |

Note that the values of moment capacity in the table above are not factored by a strength reduction factor (phi-factor).

In ACI 318, the value of the strength reduction factor depends on whether the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction
factor to compute ultimate moment capacity according to ACI 318, Section 9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

| Axial | Resist. | Nominal | Ult. (Fac) | Ult. (Fac) | Bend. Stiff. |
|---|---|---|---|---|---|

| Load No. | Factor for Moment | Moment Cap in-kips | Ax. Thrust kips | Moment Cap in-kips | at Ult Mom kip-in^2 |
|---|---|---|---|---|---|
| 1 | 0.65 | 2141. | 32.500000 | 1392. | 9939523. |
| 1 | 0.70 | 2141. | 35.000000 | 1499. | 8297160. |
| 1 | 0.75 | 2141. | 37.500000 | 1606. | 7059952. |

Layering Correction Equivalent Depths of Soil & Rock Layers

| Layer No. | Top of Layer Below Pile Head ft | Equivalent Top Depth Below Grnd Surf ft | Same Layer Type As Layer Above | Layer is Rock or is Below Rock Layer | F0 Integral for Layer lbs | F1 Integral for Layer lbs |
|---|---|---|---|---|---|---|
| 1 | 0.00 | 0.00 | N.A. | No | 0.00 | 58198. |
| 2 | 16.0000 | 9.1161 | No | No | 58198. | 98121. |
| 3 | 20.0000 | 25.3807 | No | No | 156319. | 125865. |
| 4 | 35.0000 | 18.3553 | No | No | 282184. | N.A. |

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals
for Layer n. Layering correction equivalent depths are computed only
for soil types with both shallow-depth and deep-depth expressions for
peak lateral load transfer. These soil types are soft and stiff clays,
non-liquefied sands, and cemented c-phi soil.

---

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

---

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 0.500000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 50000.0 lbs

| Depth X feet | Deflect. y inches | Bending Moment in-lbs | Shear Force lbs | Soil Res. p lb/inch | Bending Stiffness in-lb^2 |

Output Summary for Load Case No. 1:

Pile-head deflection             =     0.50000000 inches
Computed slope at pile head      =       0.000000 radians
Maximum bending moment           =      -1355972. inch-lbs
Maximum shear force              =         17884. lbs
Depth of maximum bending moment  =       0.000000 feet below pile head
Depth of maximum shear force     =       0.000000 feet below pile head
Number of iterations             =             17
Number of zero deflection points =              4

---------------------------------------------------------------------------
-------
                 Computed Values of Pile Loading and Deflection
                   for Lateral Loading for Load Case Number 2
---------------------------------------------------------------------------
-------

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head                              =     0.500000
inches
Moment at pile head                                    =          0.0 in-
lbs
Axial load at pile head                                =      50000.0 lbs

    Depth      Deflect.      Bending       Shear      Soil Res.

Output Summary for Load Case No. 2:

Pile-head deflection             =     0.50000000 inches
Computed slope at pile head      =    -0.00399948 radians
Maximum bending moment           =        642560. inch-lbs
Maximum shear force              =          8691. lbs
Depth of maximum bending moment  =    10.50000000 feet below pile head
Depth of maximum shear force     =       0.000000 feet below pile head
Number of iterations             =             13
Number of zero deflection points =              5

---------------------------------------------------------------------------
-------
            Summary of Pile-head Responses for Conventional Analyses
---------------------------------------------------------------------------
-------

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
```

Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

| Load Case No. | Load Type | Pile-head Deflection inches | Pile-head Rotation radians | Max Shear in Pile lbs | Max Moment in Pile in-lbs |
|---|---|---|---|---|---|
| 1 | 5 | 0.500000 | 0.0000 | 17884. | -1355972. |
| 2 | 4 | 0.500000 | -0.003999 | 8691. | 642560. |

Maximum pile-head deflection = 0.5000000000 inches
Maximum pile-head rotation = -0.0039994794 radians = -0.229153 deg.

The analysis ended normally.

---

## Date and Time of Analysis

---

Date: January 23, 2019 Time: 15:04:51

---

## Problem Title

---

Project Name: Wastewater Treatment Facility Improvements
Job Number: 7986.01
Client: Carollo Engineers
Engineer: LACO Associates
Description: Lateral Load Analysis - 16-inch square precast concrete

---

## Program Options and Settings

---

Computational Options:
- Use unfactored loads in computations (conventional analysis)

Engineering Units Used for Data Input and Computations:
- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

| | | |
|---|---|---|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 100 |

Loading Type and Number of Cycles of Loading:
- Static loading specified

- Use of p-y modification factors for p-y curves not selected
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
 - Output files use decimal points to denote decimal symbols.
 - Values of pile-head deflection, bending moment, shear force, and
   soil reaction are printed for full length of pile.
 - Printing Increment (nodal spacing of output points) = 1
 - No p-y curves to be computed and reported for user-specified depths
 - Print using narrow report formats
   (Note: Some output information is omitted from the narrow report
formats)

---

Pile Structural Properties and Geometry

---

Number of pile sections defined = 1
Total length of pile = 50.000 ft
Depth of ground surface below top of pile = 0.0000 ft

Pile diameters used for p-y curve computations are defined using 2
points.

p-y curves are computed using pile diameter values interpolated with
depth over
the length of the pile. A summary of values of pile diameter vs. depth
follows.

| Point No. | Depth Below Pile Head feet | Pile Diameter inches |
|---|---|---|
| 1 | 0.000 | 16.0000 |
| 2 | 50.000 | 16.0000 |

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a square prestressed concrete pile
Length of section = 50.000000 ft
Pile Width = 16.000000 in
Corner Chamfer = 0.0000 in
Shear capacity of section = 0.0000 lbs

---

## Ground Slope and Pile Batter Angles

---

Ground Slope Angle = 0.000 degrees
= 0.000 radians

Pile Batter Angle = 0.000 degrees
= 0.000 radians

---

## Soil and Rock Layering Information

---

The soil profile is modelled using 4 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 0.0000 ft |
| Distance from top of pile to bottom of layer | = | 16.000000 ft |
| Effective unit weight at top of layer | = | 95.000000 pcf |
| Effective unit weight at bottom of layer | = | 100.000000 pcf |
| Undrained cohesion at top of layer | = | 200.000000 psf |
| Undrained cohesion at bottom of layer | = | 500.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 16.000000 ft |
| Distance from top of pile to bottom of layer | = | 20.000000 ft |
| Effective unit weight at top of layer | = | 120.000000 pcf |
| Effective unit weight at bottom of layer | = | 120.000000 pcf |
| Friction angle at top of layer | = | 30.000000 deg. |
| Friction angle at bottom of layer | = | 30.000000 deg. |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for subgrade k will be computed for this layer.

Layer 3 is soft clay, p-y criteria by Matlock, 1970

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 20.000000 ft |
| Distance from top of pile to bottom of layer | = | 35.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 115.000000 pcf |
| Undrained cohesion at top of layer | = | 600.000000 psf |
| Undrained cohesion at bottom of layer | = | 800.000000 psf |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |

NOTE: Default values for Epsilon-50 will be computed for this layer.

Layer 4 is cemented silt with cohesion and friction

| | | |
|---|---|---|
| Distance from top of pile to top of layer | = | 35.000000 ft |
| Distance from top of pile to bottom of layer | = | 70.000000 ft |
| Effective unit weight at top of layer | = | 110.000000 pcf |
| Effective unit weight at bottom of layer | = | 110.000000 pcf |
| Undrained cohesion at top of layer | = | 350.000000 psf |
| Undrained cohesion at bottom of layer | = | 350.000000 psf |
| Friction angle at top of layer | = | 25.000000 deg. |
| Friction angle at bottom of layer | = | 25.000000 deg. |
| Epsilon-50 at top of layer | = | 0.0000 |
| Epsilon-50 at bottom of layer | = | 0.0000 |
| Subgrade k at top of layer | = | 0.0000 pci |
| Subgrade k at bottom of layer | = | 0.0000 pci |

NOTE: Default values for Epsilon-50 will be computed for this layer.
NOTE: Default values for subgrade k will be computed for this layer.

(Depth of the lowest soil layer extends 20.000 ft below the pile tip)

---

## Static Loading Type

---

Static loading criteria were used when computing p-y curves for all analyses.

---

## Pile-head Loading and Pile-head Fixity Conditions

---

Number of loads specified = 2

| Load No. | Load Type | Condition 1 | Condition 2 | Axial Thrust Force, lbs |
|---|---|---|---|---|
| 1 | 5 | y = 1.000000 in | S = 0.0000 in/in | 50000. |
| 2 | 4 | y = 1.000000 in | M = 0.0000 in-lbs | 50000. |

V = shear force applied normal to pile axis
M = bending moment applied to pile head
y = lateral deflection normal to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applied to pile head
Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).
Thrust force is assumed to be acting axially for all pile batter angles.

---

## Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

---

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

### Pile Section No. 1:

#### Dimensions of Square Prestressed Pile Section:

| | | |
|---|---|---|
| Length of Section | = | 50.0000 ft |
| Pile Width | = | 16.000 in |
| Corner Chamfer | = | 0.000 in |

#### Prestressing Strand Details:

| | | |
|---|---|---|
| Strand Type | = | PCI 270 |
| Yield Stress, fpu | = | 270. ksi |
| Elasticity Modulus, Es | = | 28000. ksi |

Stress-strain curve defined using PCI 270 7-wire Lo-lax equation
If eps > 0.0086 fpu (ksi) = 270 - 0.04/(eps-0.007)
Number of Reinforcing Strands = 8
Cross-sectional Area of Single Strand = 0.153 sq. in.
Concrete Cover Thickness Over Strands = 2.000 in

Prestressing Strand Geometry:
---

| Strand No. | Diameter in | Area sq. in | X in | Y in |
|---|---|---|---|---|
| 1 | 0.500 | 0.153 | 5.750 | 0.000 |
| 2 | 0.500 | 0.153 | 4.066 | 4.066 |
| 3 | 0.500 | 0.153 | 0.000 | 5.750 |
| 4 | 0.500 | 0.153 | -4.066 | 4.066 |
| 5 | 0.500 | 0.153 | -5.750 | 0.000 |
| 6 | 0.500 | 0.153 | -4.066 | -4.066 |
| 7 | 0.500 | 0.153 | -0.000 | -5.750 |
| 8 | 0.500 | 0.153 | 4.066 | -4.066 |

Computation of Loss of Prestress:
---

Initial Prestressing Force = 194.564 kips
Fraction of Loss of Prestress = 0.100
Effective Prestressing Force After Losses = 175.108 kips
Area of Concrete, Ac = 254.776 sq.in
Area of Steel, As = 1.224 sq.in
Stress in Concrete After Losses, f_pc = 0.687 ksi
Stress in Steel After Losses = -143.062 ksi
Compressive Strain in Concrete After Losses = 0.0001557
Tensile Strain in Steel After Losses = -0.0051093
Axial Tension Load for Cracking of Concrete = -245.167 kips

Estimated Structural Capacities Computed Using PCI Equations:
---

Nom. Axial Cap., Pn = (0.85 f'c - 0.60 f_pc) Ag = 1200.031 kips
Unfac. Axial Load Cap. N = (0.33 f'c - 0.27 f_pc) Ag = 459.374 kips
Axial Capacity in Tension, Nt = As fpu = -330.480 kips
Nom. Moment Capacity, Mn = 0.37 D As fpu = 1956.442 in-kip

Note: The estimate of nominal moment capacity is based on equations that

assume compressive strength of concrete is 6,000 psi (41.4 MPa), the value
of prestress after losses is 700 psi (4.83 MPa), and axial thrust force is
zero. When input values for these factors are different, the estimated value
of nominal moment capacity will differ from the capacity computed by LPile
and should be considered only as an approximate check.

Concrete Properties:
---

| | | |
|---|---|---|
| Compressive Strength of Concrete | = | 6000. psi |
| Modulus of Elasticity of Concrete | = | 4415201. psi |
| Modulus of Rupture of Prestressed Concrete | = | -309.838668 psi |
| Compression Strain at Peak Stress | = | 0.002310 |
| Tensile Strain at Fracture of Concrete | = | -0.0000604 |
| Maximum Coarse Aggregate Size | = | 0.750000 in |

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

| Number | Axial Thrust Force kips |
|---|---|
| 1 | 50.000 |

Definitions of Run Messages and Notes:
---

C = concrete in section has cracked in tension.
Y = stress in reinforcing steel has reached yield stress.
T = ACI 318 criteria for tension-controlled section met, tensile strain in
reinforcement exceeds 0.005 while simultaneously compressive strain in
concrete more than 0.003. See ACI 318, Section 10.3.4.
Z = depth of tensile zone in concrete section is less than 10 percent of
section depth.

Bending Stiffness (EI) = Computed Bending Moment / Curvature.
Position of neutral axis is measured from edge of compression side of pile.
Compressive stresses and strains are positive in sign.
Tensile stresses and strains are negative in sign.

Axial Thrust Force = 50.000 kips

| Bending Curvature rad/in. | Bending Moment in-kip | Bending Stiffness kip-in2 | Depth to N Axis in | Run Msg |
|---|---|---|---|---|

---

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

---

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

| Load No. | Axial Thrust kips | Nominal Mom. Cap. in-kip | Max. Comp. Strain |
|---|---|---|---|
| 1 | 50.000 | 2140.838 | 0.00300000 |

Note that the values of moment capacity in the table above are not factored by a strength reduction factor (phi-factor).

In ACI 318, the value of the strength reduction factor depends on whether the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction
factor to compute ultimate moment capacity according to ACI 318, Section 9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

| Axial | Resist. | Nominal | Ult. (Fac) | Ult. (Fac) | Bend. Stiff. |
|---|---|---|---|---|---|

| Load No. | Factor for Moment | Moment Cap in-kips | Ax. Thrust kips | Moment Cap in-kips | at Ult Mom kip-in^2 |
|---|---|---|---|---|---|
| 1 | 0.65 | 2141. | 32.500000 | 1392. | 9939523. |
| 1 | 0.70 | 2141. | 35.000000 | 1499. | 8297160. |
| 1 | 0.75 | 2141. | 37.500000 | 1606. | 7059952. |

Layering Correction Equivalent Depths of Soil & Rock Layers

| Layer No. | Top of Layer Below Pile Head ft | Equivalent Top Depth Below Grnd Surf ft | Same Layer Type As Layer Above | Layer is Rock or is Below Rock Layer | F0 Integral for Layer lbs | F1 Integral for Layer lbs |
|---|---|---|---|---|---|---|
| 1 | 0.00 | 0.00 | N.A. | No | 0.00 | 58198. |
| 2 | 16.0000 | 9.1161 | No | No | 58198. | 98121. |
| 3 | 20.0000 | 25.3807 | No | No | 156319. | 125865. |
| 4 | 35.0000 | 18.3553 | No | No | 282184. | N.A. |

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals
for Layer n. Layering correction equivalent depths are computed only
for soil types with both shallow-depth and deep-depth expressions for
peak lateral load transfer. These soil types are soft and stiff clays,
non-liquefied sands, and cemented c-phi soil.

---

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

---

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 1.000000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 50000.0 lbs

| Depth X feet | Deflect. y inches | Bending Moment in-lbs | Shear Force lbs | Soil Res. p lb/inch | Bending Stiffness in-lb^2 |

Output Summary for Load Case No. 1:

Pile-head deflection             =     1.00000000 inches
Computed slope at pile head      =       0.000000 radians
Maximum bending moment           =      -1740150. inch-lbs
Maximum shear force              =         23717. lbs
Depth of maximum bending moment  =       0.000000 feet below pile head
Depth of maximum shear force     =       0.000000 feet below pile head
Number of iterations             =             21
Number of zero deflection points =              4

--------------------------------------------------------------------------
-------
                 Computed Values of Pile Loading and Deflection
                   for Lateral Loading for Load Case Number 2
--------------------------------------------------------------------------
-------

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head                                =     1.000000
inches
Moment at pile head                                      =          0.0 in-
lbs
Axial load at pile head                                  =      50000.0 lbs

    Depth      Deflect.      Bending       Shear      Soil Res.
Bending
      X            y         Moment        Force          p
Stiffness
    feet        inches       in-lbs         lbs        lb/inch      in-
lb^2

Output Summary for Load Case No. 2:

| | | |
|---|---|---|
| Pile-head deflection | = | 1.00000000 inches |
| Computed slope at pile head | = | -0.00747346 radians |
| Maximum bending moment | = | 994973. inch-lbs |
| Maximum shear force | = | 12347. lbs |
| Depth of maximum bending moment | = | 11.00000000 feet below pile head |
| Depth of maximum shear force | = | 0.000000 feet below pile head |
| Number of iterations | = | 19 |
| Number of zero deflection points | = | 4 |

---

Summary of Pile-head Responses for Conventional Analyses

---

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs

Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

| Load Case No. | Load Type | Pile-head Deflection inches | Pile-head Rotation radians | Max Shear in Pile lbs | Max Moment in Pile in-lbs |
|---|---|---|---|---|---|
| 1 | 5 | 1.000000 | 0.0000 | 23717. | -1740150. |
| 2 | 4 | 1.000000 | -0.007473 | 12347. | 994973. |

Maximum pile-head deflection = 1.0000000000 inches
Maximum pile-head rotation = -0.0074734602 radians = -0.428198 deg.

The analysis ended normally.

## Shear-Induced Building Settlement (Ds) calculation procedure

The shear-induced building settlement (Ds) due to liquefaction below the building can be estimated using the relationship developed by Bray and Macedo (2017):

$$Ln(Ds) = c1 + c2 * LBS + 0.58 * Ln\left(Tanh\left(\frac{HL}{6}\right)\right) + 4.59 * Ln(Q) - 0.42 * Ln(Q)^2 - 0.02 * B + 0.84 * Ln(CAVdp) + 0.41 * Ln(Sa1) + \varepsilon$$

where Ds is in the units of mm, c1= -8.35 and c2= 0.072 for LBS ≤ 16, and c1= -7.48 and c2= 0.014 otherwise. Q is the building contact pressure in units of kPa, HL is the cumulative thickness of the liquefiable layers in the units of m, B is the building width in the units of m, CAVdp is a standardized version of the cumulative absolute velocity in the units of g-s, Sa1 is 5%-damped pseudo-acceleration response spectral value at a period of 1 s in the units of g, and ε is a normal random variable with zero mean and 0.50 standard deviation in Ln units. The liquefaction-induced building settlement index (LBS) is:

$$LBS = \sum W * \frac{\varepsilon_{shear}}{z} dz$$

where z (m) is the depth measured from the ground surface > 0, W is a foundation-weighting factor wherein W = 0.0 for z less than Df, which is the embedment depth of the foundation, and W = 1.0 otherwise. The shear strain parameter (ε_shear) is the liquefaction-induced free-field shear strain (in %) estimated using Zhang et al. (2004). It is calculated based on the estimated Dr of the liquefied soil layer and the calculated safety factor against liquefaction triggering (FSL).

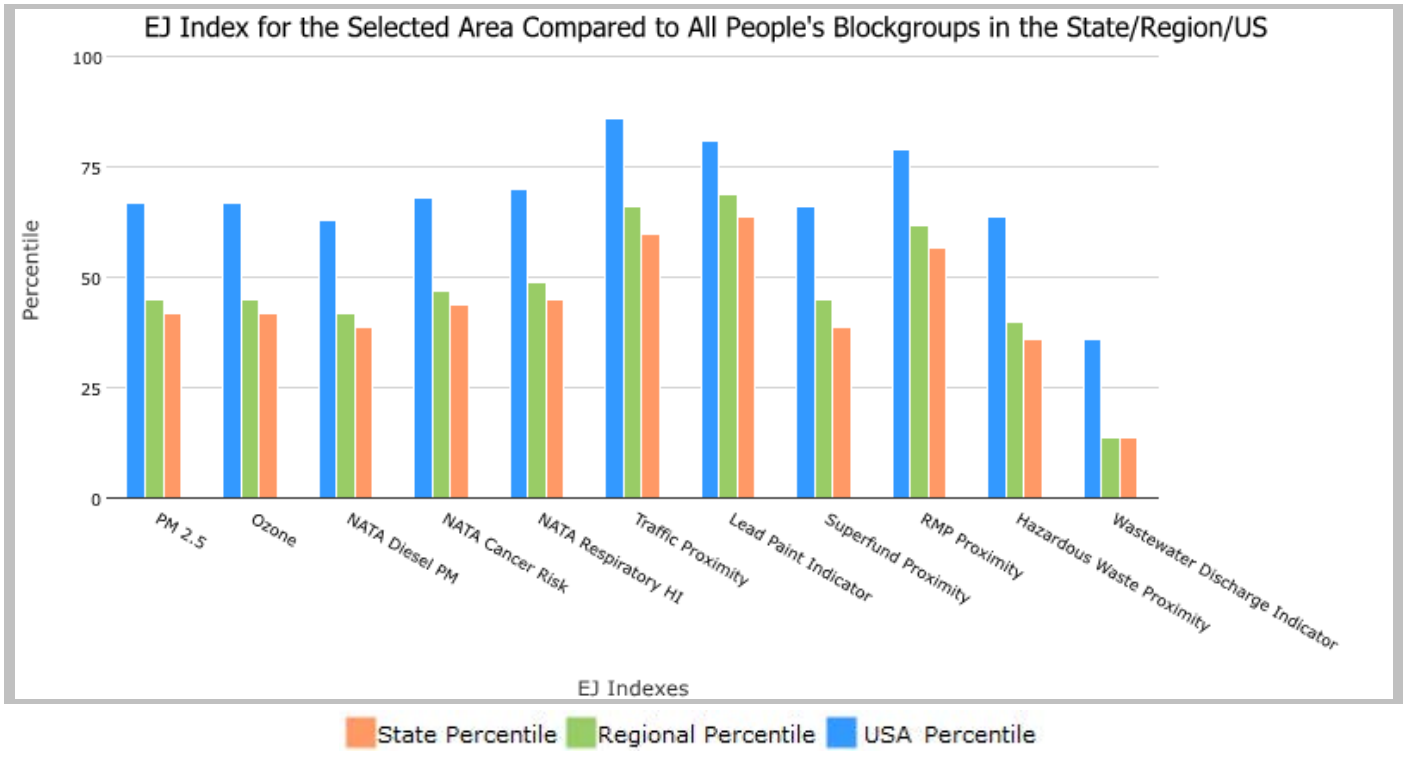
# EJSCREEN Report (Version 2019)

**1 miles Ring Centered at 40.854681,-124.089310, CALIFORNIA, EPA Region 9**

**Approximate Population: 2,295**

**Input Area (sq. miles): 3.14**

| Selected Variables | State Percentile | EPA Region Percentile | USA Percentile |
|---|---|---|---|
| **EJ Indexes** | | | |
| EJ Index for PM2.5 | 42 | 45 | 67 |
| EJ Index for Ozone | 42 | 45 | 67 |
| EJ Index for NATA* Diesel PM | 39 | 42 | 63 |
| EJ Index for NATA* Air Toxics Cancer Risk | 44 | 47 | 68 |
| EJ Index for NATA* Respiratory Hazard Index | 45 | 49 | 70 |
| EJ Index for Traffic Proximity and Volume | 60 | 66 | 86 |
| EJ Index for Lead Paint Indicator | 64 | 69 | 81 |
| EJ Index for Superfund Proximity | 39 | 45 | 66 |
| EJ Index for RMP Proximity | 57 | 62 | 79 |
| EJ Index for Hazardous Waste Proximity | 36 | 40 | 64 |
| EJ Index for Wastewater Discharge Indicator | 14 | 14 | 36 |



This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

* The National-Scale Air Toxics Assessment (NATA) is EPA's ongoing, comprehensive evaluation of air toxics in the United States. EPA developed the NATA to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that NATA provides broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. More information on the NATA analysis can be found at: https://www.epa.gov/national-air-toxics-assessment.

For additional information, see: www.epa.gov/environmentaljustice

EJSCREEN is a screening tool for pre-decisional use only. It can help identify areas that may warrant additional consideration, analysis, or outreach. It does not provide a basis for decision-making, but it may help identify potential areas of EJ concern. Users should keep in mind that screening tools are subject to substantial uncertainty in their demographic and environmental data, particularly when looking at small geographic areas. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports. This screening tool does not provide data on every environmental impact and demographic factor that may be relevant to a particular location. EJSCREEN outputs should be supplemented with additional information and local knowledge before taking any action to address potential EJ concerns.

# 1 INTRODUCTION

## 1.1 Project Description and Proponent

The City of Arcata owns the wastewater collection, treatment, and disposal facilities that serve approximately 16,800 residents in the service area. The Arcata Wastewater Treatment Facility (AWTF) currently discharges treated wastewater to Humboldt Bay in conjunction with enhanced treatment wastewater to constructed freshwater marshes in the Arcata Marsh Wildlife Sanctuary (AMWS). These features collectively form the Arcata Wastewater Treatment Plant (WWTP).

The City of Arcata is proposing to replace a portion of existing Arcata WWTP infrastructure and upgrade several components as part of the Arcata WWTP Improvement Project (hereinafter, Project). The work will include installation of buried pipe for the flow reconfiguration of disinfected enhancement wetlands effluent, installing a discharge pipe into a constructed brackish marsh at the north end of the Arcata Bay section of Humboldt Bay (future outfall discharge point), relocation of the electrical equipment building in the AWTF to allow for improved road access for fire and emergency services (requiring installation of a new utility service line), and constructing a mitigation wetland area.

The Project proponent, City of Arcata, may be contacted at:

Mark Andre, Environmental Services-Director

## 1.2 Project Location and Survey area

The Project is located at 600 South G Street in Arcata, Humboldt County, California (Figure 1). The Survey area includes:

- Areas associated with the current and future Arcata WWTP including the southern edge of Gearheart enhancement marsh, the northern, eastern, and southern edges of Hauser enhancement marsh, the south east corner of Brackish Pond, and the adjacent levees, trails, and roadways within the AMWS;
- The AWTF including the levees surrounding various treatment marshes and oxidation ponds and the area northeast to South G Street;
- Multiple staging areas within paved and gravel parking lots; and
- A potential wetland mitigation area just south of Humboldt State University's Samoa Facility (just east of Post Mile 8.00) to the northern edge of Western Pond.

These locations can be accessed from CA-255 (Samoa Boulevard) in Arcata, California by heading south on South I Street and South G Street (Figure 1). The potential wetland mitigation area can be accessed south of Post Mile 8.00 on CA-255 (Figure 1). The Survey area is in Section 34 of Township 6 North, Range 1 East of the Arcata North U.S. Geological Survey (USGS) 7.5-minute topographic quadrangle. Elevations range from 0 to 18 feet above mean sea level.

The entire Survey area is within the City of Arcata's Coastal Zone governed by the City's Local Coastal Program—LCP and Land Use and Development Guide (LUDG) General Plan (City of Arcata 2008). A portion of the potential mitigation area near Western Pond and a staging area along South I Street also fall within the appeal zone for the California Coastal Commission (CCC), where coastal development permits may be appealed to the CCC.

## 1.3 Purpose of the Wetland Delineation

The purpose of this delineation is to: (1) assess the geographic extent of water and wetland resources in the Survey area; (2) delineate any waters of the U.S., including wetlands, potentially subject to the jurisdiction of the U.S. Army Corps of Engineers (USACE) under Section 404 of the Clean Water Act (CWA) and/or Section 10 of the Rivers and Harbors Act of 1899; (3) delineate any additional waters of the State that may be subject to the jurisdiction of the State Water Resources Control Board (SWRCB), California Department of Fish and Wildlife (CDFW), and/or City of Arcata LCP/LUDG and CCC.

The wetland features in the Survey area are considered preliminary until verified by the San Francisco Regulatory Branch of the USACE. The USACE determines CWA jurisdiction of the wetland features in the Survey area. Previous correspondence between the USACE and the City of Arcata indicates that portions of the Arcata Wastewater Treatment Marsh are exempt from USACE-jurisdiction (City of Arcata 2010, Attachment 5). Per the April 21, 2020 final rule of the *Navigable Waters Protection Rule* (85 FR 22250), waste treatment systems, defined as "all components, including lagoons and treatment ponds (such as settling or cooling ponds), designed to either convey or retain, concentrate, settle, reduce, or remove pollutants, either actively or passively, from wastewater prior to discharge (or eliminating any such discharge)," are non-jurisdictional waters (i.e., not waters of the United States) (33 CFR 328). Furthermore, waters and features that are excluded in the final rule cannot be determined to be jurisdictional even when the water satisfies one or more of the conditions to be a jurisdictional water (e.g., lakes and ponds, and impoundments of jurisdictional waters). The final rule also notes that when an applicant receives a permit to impound a water of the United States in order to construct a waste treatment system (i.e., the permit received in 1956 for construction of the AWTF oxidation ponds and surrounding levees within the Humboldt Bay tidelands), the permitting agencies have affirmatively relinquished jurisdiction over the resulting waste treatment system as long as it is used for this permitted purpose.

**Figure 1.** Project location and waters/wetland delineation Survey area.

# 2 METHODS

## 2.1 Existing Conditions

Prior to the delineation, existing information on soils, hydrology, and precipitation in the Survey area was evaluated. Information on potential jurisdictional waters and wetlands was obtained from the U.S. Fish and Wildlife Service (USFWS) National Wetlands Inventory (NWI) online application, *Wetlands Mapper* (USFWS 2019) and the LCP *Coastal Wetlands Map* (City of Arcata 1989). Available data from the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS) Web Soil Survey website were reviewed for the Survey area and nearby vicinity (NRCS 2019a). Mean high water shoreline data for Humboldt Bay (Northern Hydrology & Engineering 2014) were incorporated into Geographic Information Systems (GIS) and reviewed. Precipitation and climate records from the National Climatic Data Center (NCDC 2019 and 2020) were reviewed for nearby weather station Eureka Weather Forecast Office (WFO), Woodley Island, California.

## 2.2 Field Delineation

A delineation of potential jurisdictional waters and wetlands were conducted by qualified personnel on October 2–3, 8, and 17, 2019, March 12, 2020, and May 29, 2020 in accordance with the *Corps of Engineers Wetlands Delineation Manual* (1987 Manual, USACE 1987), *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region (Version 2.0)* (WMVC Supplement; USACE 2010), and USACE *Regulatory Guidance Letter (RGL) No. 05-05* (USACE 2005). The delineation included any feature that could potentially meet the definition of a water protected under the Clean Water Act (and thus be subject to USACE-jurisdiction), the Porter Cologne Act (SWRCB [State]-jurisdiction), Section 1602 of Streambed Alteration Agreement (California Department of Fish and Wildlife [CDFW]-jurisdiction) and the City of Arcata LCP/LUDG (LCP-jurisdiction). LCP-jurisdiction includes one-parameter wetlands within the coastal zone and two-parameter wetlands within the City of Arcata. In addition, any wetland feature delineated within the Coastal Zone was reviewed for consistency against the LCP Coastal Wetland Map and the USFWS NWI map.

### 2.2.1 Waters determination

Under Section 404 of the CWA, the limits of USACE jurisdiction is defined at the High Tide Line (HTL) or Ordinary High Water Mark (OHWM). Under Section 10 of the Rivers and Harbors Act of 1899 for activities in navigable waters (i.e., Humboldt Bay) the limits of USACE jurisdiction is defined at Mean High Water (MHW). Furthermore, waters of the State include any surface water or groundwater, including saline waters, within the boundaries of the state (Porter-Cologne Act, Section 13050). All waters associated with the Arcata WWTP including Gearheart, Hauser, and Allen enhancement marshes and the AWTF treatment marshes and oxidation ponds (Figure 1) are exempt from USACE-jurisdiction per the final rule (33 CFR Part 328); however, they were delineated as waters of the State (State-jurisdiction).

The extent of waters in the Survey area were delineated by the location of the OHWM, HTL, and MHW. The OHWM is defined as the elevation established on the shore by water fluctuations, and is indicated by physical characteristics such as: (a) a clear, natural line impressed on the bank; (b) shelving; (c) changes in the character of soil; (d) destruction of terrestrial vegetation; (e) the presence of litter and debris; or (f) other appropriate means that consider the characteristics of the surrounding areas. The OHWM was identified in accordance with the USACE RGL 05-05

(USACE 2005) and the OHWM Guide (Mersel and Lichvar 2014). 33 CFR 328.3(d) defines the HTL as the line of intersection of the land with the water's surface at the maximum height reached by a rising tide and may be determined, in the absence of actual data, by: (a) a line of oil or scum along shore objects; (b) a more or less continuous deposit of fine shell or debris on the foreshore or berm; (c) other physical markings or characteristics; (d) vegetation lines; or (e) tidal gages, or other suitable means that delineate the general height reached by a rising tide. The HTL encompasses spring high tides and other high tides that occur with periodic frequency but does not include storm surges in which there is a departure from the normal or predicted reach of the tide due to the piling up of water against a coast by strong winds such as those accompanying a hurricane or other intense storm. The 2014 mean high water shoreline data for Humboldt Bay (Northern Hydrology & Engineering 2014) was used to delineate the extent of Section 10 waters.

Prior to the wetland delineation surveys, aerial photographs and topographic maps were reviewed to identify limits and connections of potential wetlands to traditional navigable waters (TNW) such as the Humboldt Bay. During the wetland delineation, waters in the Survey area were further reviewed for their connectivity to a TNW based on culvert connections and the existing drainage network. The OHWM and HTL of potentially jurisdictional waters were delineated in the field. Boundaries were mapped via a sub-meter Global Positioning System (GPS) unit (Trimble Geo 7x) and later post-processed, corrected, and incorporated into GIS where maps detailing the delineation results were generated.

### 2.2.2 Wetland determination

Wetlands were delineated in accordance with the 1987 Manual (USACE 1987) and WMVC Supplement (USACE 2010). The 1987 Manual and WMVC Supplement provide technical guidelines and methods for the three-parameter approach to determining the location and boundaries of USACE jurisdictional wetlands. This approach requires that an area must support positive indicators of hydrophytic vegetation, hydric soils, and wetland hydrology to be considered a jurisdictional wetland. A three-parameter wetland with a direct hydrological surface connection to a jurisdictional water in a typical year is considered an USACE jurisdictional wetland (i.e., adjacent wetlands). Connectivity of delineated wetlands to jurisdictional waters was evaluated in accordance with USACE RGL 07-01 (USACE 2007). As the Survey area is located within the Coastal Zone, all wetland features were also evaluated for potential LCP-jurisdiction which requires that only one or two of the three USACE wetland parameters (hydrophytic vegetation, hydric soils, and/or wetland hydrology) be present (1976 California Coastal Act, Public Resources Code Section 30000 *et seq*., City of Arcata 2008).

A total of 28 data points were sampled in potential USACE- and LCP-jurisdictional wetlands in the Survey area. If a data point met all three wetland parameters, it was considered an USACE wetland; if a point only met one or two wetland parameters, it was considered a LCP wetland; if a point met no wetland parameters, it was considered upland. Potential wetland areas were identified based on information generated from the pre-field review (e.g., the NWI *Wetland Mapper* results) and observations of hydrology and vegetation in the field. If a data point met all three parameters for a USACE jurisdictional wetland, then a paired data point was placed along the preliminary transition zone (the area in which a change from wetland to non-wetland conditions occurs) to determine the wetland/upland boundary. If a wetland was sampled and no adjacent uplands were identified within the Survey area, then a paired upland data point was not sampled. At each data point, a soil pit was dug and the following information was recorded using the USACE (2010) data forms:

1. **Vegetation**: Dominant plant species for each stratum (i.e., tree, sapling/shrub, herb, woody vine) by scientific name (genus and species) following the taxonomy the online *Jepson eFlora* (Jepson Flora Project 2019). Absolute percent cover and dominance were determined using the 50/20 rule outlined in the *WMVC Supplement*, and the wetland indicator status (OBL [obligate], FACW [facultative-wet], FAC [facultative], FACU [facultative-upland], and UPL [upland]) defined for the WMVC Region in the *National Wetland Plant List: 2016 Wetland Ratings* (Lichvar et al. 2016). Plant species not listed in the *2016 National Wetland Plant List* were considered upland (UPL) species. A dominance test was performed to determine if the data point exhibited hydrophytic vegetation. If the dominance test was not conclusive and wetland hydrology and hydric soils were present, then the prevalence index was calculated.
2. **Hydrology**: Presence and depth of surface water, groundwater, and/or soil saturation were recorded. In addition, if primary (e.g., oxidized rhizospheres along living roots) and secondary indicators (e.g., drainage patterns, dry-season water table, saturation visible on aerial imagery) were observed, then they were also recorded at each data point.
3. **Soils**: Moistened soil matrix descriptions were recorded for each data point using the following: depth of the sample, color (as defined in Munsell soil color charts [Munsell Color 2000]), and texture. If present, redox features were then described by type (e.g., concentration, depletion, reduced matrix) and location (e.g., pore lining, root channel, or matrix). Hydric soils were determined using the *WMVC Supplement* primary indicators, such as sandy redox (S5). In addition, mapped soil units (described in Section 3.1.2) were considered and the current National List of Hydric Soils (NRCS 2019b) was consulted.

The location of each data point and wetland boundaries were recorded using a sub-meter accuracy GPS and photographs were taken of the representative site characteristics. All GPS data were post-processed, corrected, and incorporated into GIS. Mapped wetlands were classified according to the *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin et al. 1979, Federal Geographic Data Committee [FCDC] 2013) based on the vegetation composition and structure at the data points.

# 3 RESULTS

## 3.1 Historical Conditions

Historically, the Survey area was composed of Arcata Bay tidelands (i.e., tidal sloughs and marshes) (U.S. Coast Survey 1870). In the late 1800s, much of the Survey area was used for various industrial activities (e.g., wharf, railroad, timber transport) and later diked for agricultural purposes (i.e., farming and pasture) and nearby lumber mill operations. The WWTP enhancement marshes and AWTF oxidation ponds and treatment marshes were constructed between 1949–1983. Construction of the AWTF oxidation ponds and its surrounding levees within the tidelands of Humboldt Bay (approximately 70 acres) was authorized on May 17, 1956 by the USACE San Francisco District. Prior to the recent restoration associated with the McDaniel Slough Marsh Enhancement Project (City of Arcata 2013) and other mitigation efforts, a portion of the potential mitigation area near Western Pond was used for agricultural grazing. Brackish Pond, Western Pond, and North Pond were formerly grazed pasture prior to construction in 2007 and 2013.

The conversion of land and the historical industrial and agricultural land use in the Survey area has altered the natural vegetation, hydrology, and soils. Normal conditions have since established for much of the Survey area's restored and undeveloped areas.

## 3.2 Existing Conditions

### 3.2.1 Hydrology

The Project is in the Mad River Lowland Subbasin of the Mad River Groundwater Basin. This basin includes the coastal floodplain from the Freshwater Fault north to the Mad River and is primarily composed of alluvium that is underlain by the Pleistocene Hookton Formation. This water-bearing formation consists of clay, sand, and gravel (CDWR 2004). The Hookton Formation is recharged by rainfall in the upland recharge areas east of Arcata (DWR 1973) in addition to lateral water movement into the alluvium from adjacent formations and some upward movement from leakage due to differences in head between the alluvium and underlying formations (Fuller 1975).

The Project is located within the Humboldt Bay Subwatershed (Hydrologic Unit Code [HUC] 12: 180101020601) of the Humboldt Bay-Frontal Pacific Ocean watershed in the North Coast Hydrologic Region and within the Jacoby Creek Watershed of the Eureka Plain Hydrologic Unit No. 110.00 (NRCWCB 2019). The Project is also within the Janes Creek and Jolly Giant Creek watersheds within the City of Arcata (City of Arcata 2016). The Survey area abuts Arcata Bay, the northernmost estuary of Humboldt Bay (a TNW). Arcata Bay occupies the low seaward end of several valleys which have been filled by floodplain and tidal flat deposits (Murray and Wunner 1988). The Project also includes Butcher Slough, a tributary to Arcata Bay (Figure 1).

The WWTP man-made freshwater enhancement marshes in the Survey area include Hauser Marsh, Gearheart Marsh, and Allen Marsh. Water associated with these enhancement marshes originates from the disinfection basins of the WWTP. This treated wastewater is eventually pumped back to the AWTF for final disinfection then discharged via an outfall pipe into the Arcata Bay section of Humboldt Bay. Additional man-made features in the Survey area include Brackish Pond, Western Pond, and North Pond (Figure 1). Brackish and Western ponds have direct connections (e.g., drainpipes with tidal flap, tide gate) to McDaniel Slough and eventually the Arcata Bay section of Humboldt Bay. The future outfall of treated AWTF effluent will discharge into Brackish Pond. The North Pond does not have a surface water connection to adjacent water bodies (Figure 1). The roadside ditch along South G Street near the AWTF has surface water connection to a tributary to Butcher Slough (Figure 1). Additional man-made waters adjacent to the Survey area include Klopp Lake and the AWTF oxidation ponds and treatment marshes. At these locations, the proposed Project construction occurs within the upland constructed levees above the mean high, high water and the normal water surface elevation of the AWTF oxidation ponds and treatment marshes.

The NWI *Wetlands Mapper* includes various palustrine and estuarine wetlands the Survey area (Figure 2). These features largely correlate with the LCP Coastal Wetlands Map and the field delineation results (Section 3.3).

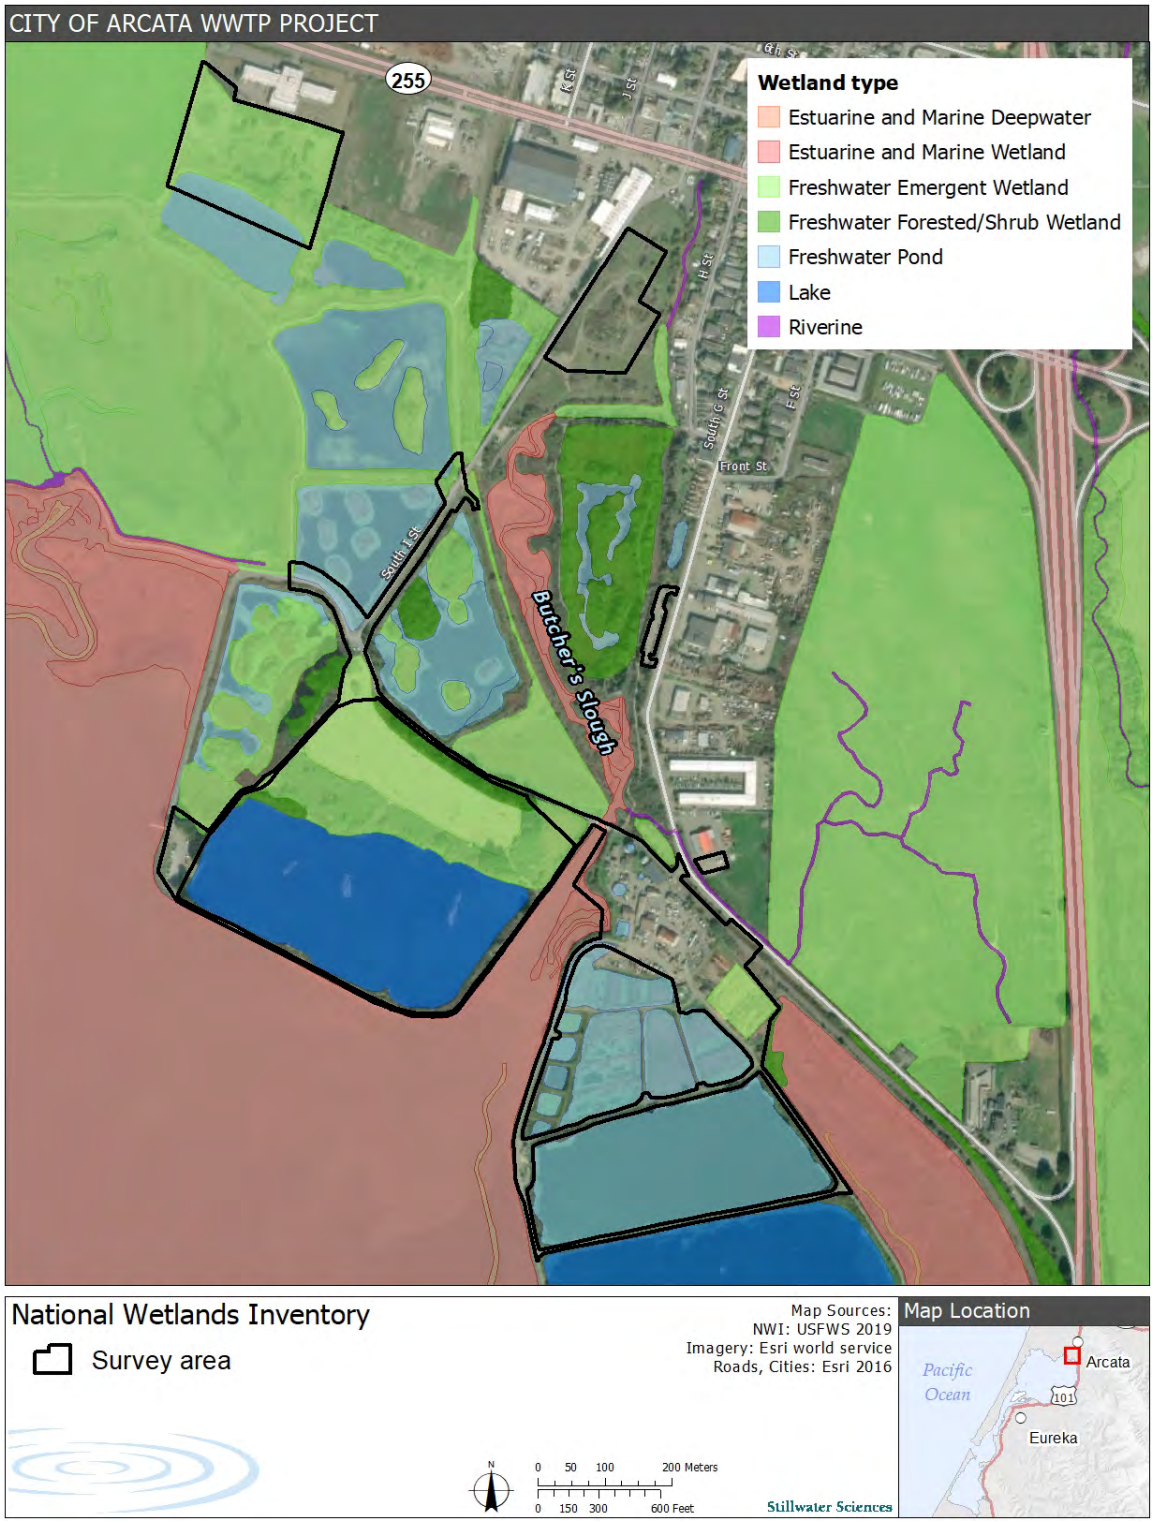

**Figure 2.** National Wetlands Inventory map of the Survey area (Source: USFWS 2020).

### 3.2.2 Soil units

Soil units in the Survey area included Occidental, 0–2% slopes; Hydraquents-Wassents mucky silt loam, strongly saline, 0–3 % slopes, very frequently flooded; and Urban land-Anthraltic Xerorthents association, 0–2% slopes (Figure 3). The NRCS soil survey mapped the AMWS and AWTF oxidation ponds and treatment marshes as water and no mapped soil unit was described within these limits (Figure 3). Prior to the current setting (i.e., AMWS, AWTF, McDaniel Slough Restoration), this region was composed of bay tidelands that were eventually diked and used for various industrial and agricultural purposes. As such, soils at these locations are disturbed and contain dredge spoils and nonnative fill material.

Occidental (0 to 2% slopes) is found in areas with elevations that range from 0 to 30 feet above mean sea level and with a mean annual precipitation of 35–80 inches, a mean annual air temperature of 50–55º F, and a frost-free period of 275–330 days (NRCS 2019a). The Occidental series is primarily located along the backslope of salt marshes. A typical profile consists of peat in the upper 0–3 inches (Oi horizon) with silty clay loam forming all other horizons below. It has a drainage class of very poorly drained with a depth to water table and redoximorphic features ranging from 0–4 inches (NRCS 2017, 2019a). It frequently ponds and is occasionally flooded with a slightly saline to strong saline profile. Occidental series is listed as a hydric soil in the region (NRCS 2019a) with an aquic soil regime (NRCS 2017). The water table from August through November is typically ≥35 inches (NRCS 2017) however ranges from 0–35 inches depth in December–July. The Project's potential mitigation site near the McDaniel Slough and one staging area on the South I Street were located within this mapped soil unit.

Hydraquents-Wassents mucky silt loam, strongly saline, 0–3 % slopes, very frequently flooded, is composed of 50% Hydraquents, low tidal and similar soils, 40% Wassents, and 10% minor components. It is found from 0 to 10 feet above mean sea level with a mean annual precipitation of 35–80 inches, a mean annual air temperature of 50–55ºF, and a frost-free period of 275–365 days (NRCS 2019a). Hydraquents, low tidal is located on tidal flats with a parent material of mucky, silty, and clayey estuarine deposits and a slope of 0–3%. A typical profile consists entirely (0–59 inches) of mucky silty clay loam. It has a drainage class of very poorly drained, a depth to water table of 0 inches, is very frequently flooded, and strongly saline (NRCS 2019a). Hydraquents, low tidal is listed as a hydric soil in the region. The Wassents series shares Hydraquents properties and qualities except for its typical profile has mucky silt loam in the upper 6 inches, has a slope of 0–1%, and a subaqueous drainage class. Wassents is also listed as a hydric soil in the region. Minor components of this map unit include the Hydraquents, high tidal (5%) and marine waters (5%) (NRCS 2019a). The Arcata Bay section of Humboldt Bay is mapped as this soil unit type.

Urban land-Anthraltic Xerorthents association (0 to 2% slopes) is composed of 80% urban land, industrial and 20% anthralitic xerorthents and similar soils. This association is found from 0 to 10 feet above mean sea level with a mean annual precipitation of 41–43 inches, a mean annual air temperature of 50–55ºF, and a frost-free period of 275–330 days (NRCS 2019a). Anthraltic Xerorthents is located on backslopes of fluviomarine terraces with a parent material of coarse-loamy fluviomarine deposit or coarse-loamy dredge spoils. A typical profile consists of gravelly loamy fine sand within the upper 0–6 inches with sandy loam, gravelly sand, and sand forming the horizons below. It has a drainage class of moderately well drained (NRCS 2019a). The AWTF and levees adjacent to the Arcata Bay section of Humboldt Bay as well as the industrial areas along South G Street are included in this mapped soil unit.

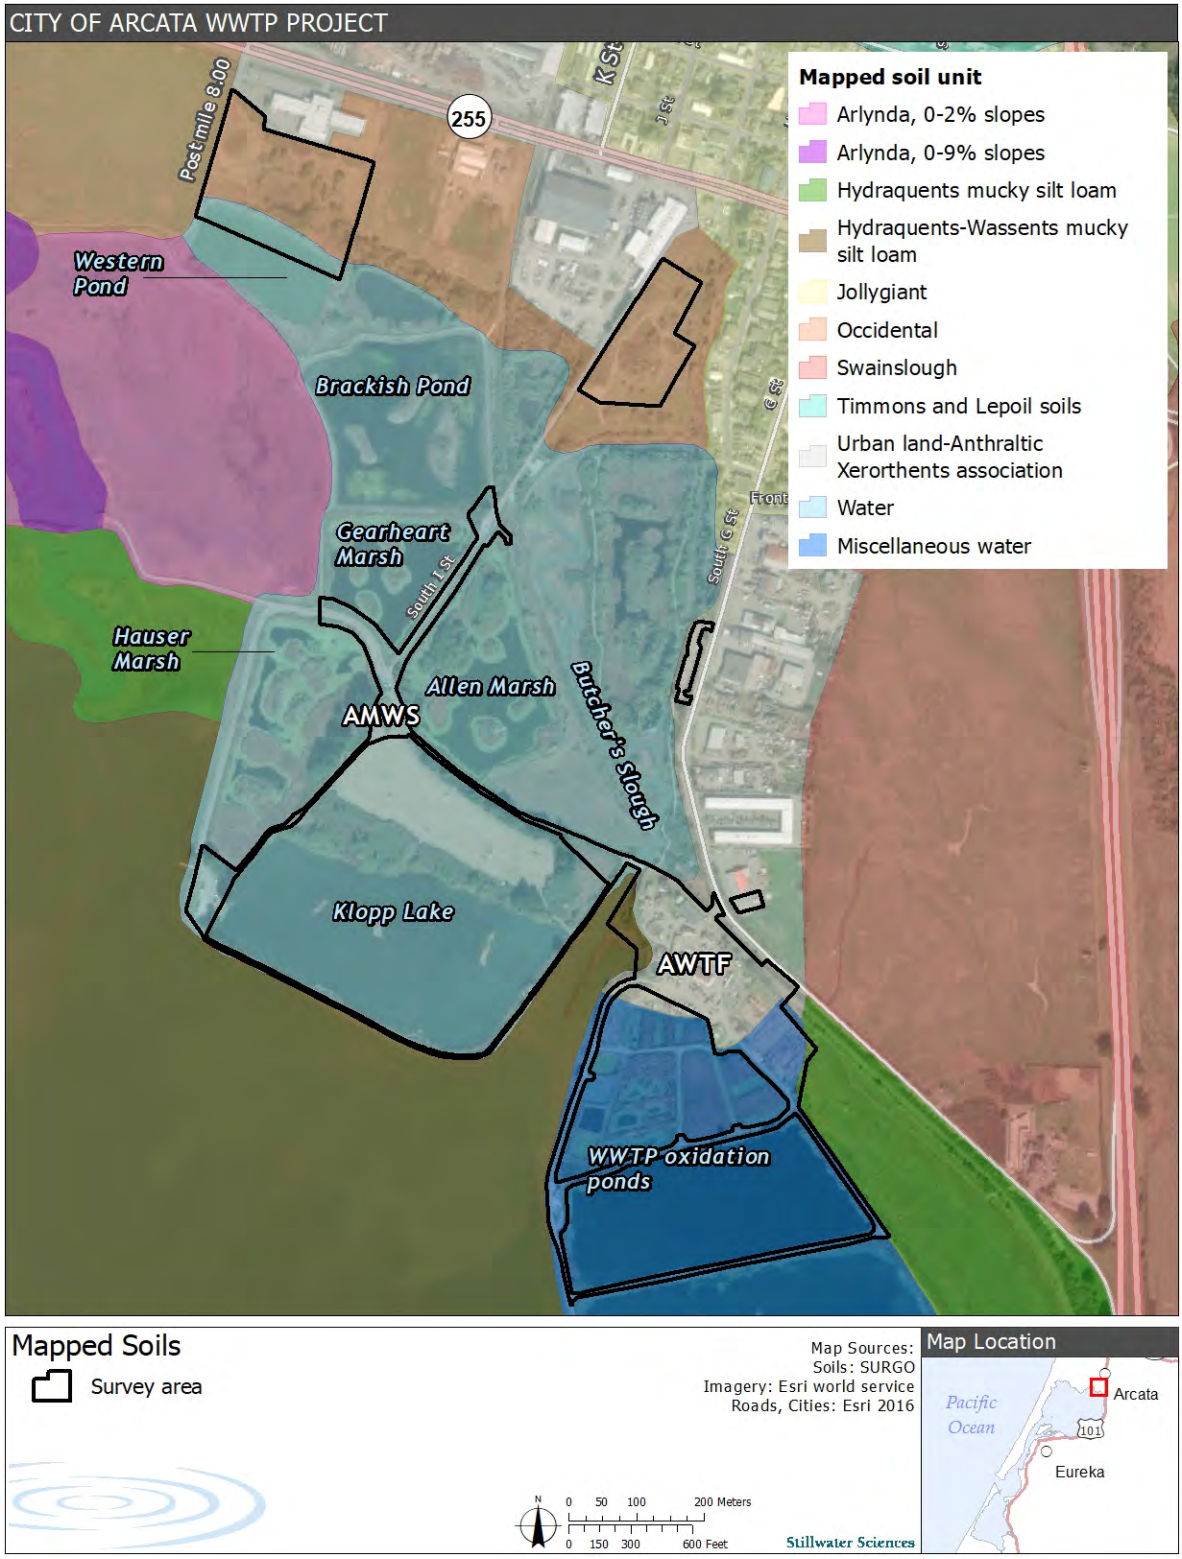

**Figure 3.** Mapped soil units in the Survey area.

Palustrine wetland data points closely resembled the hydric soil Occidental series (NRCS 2019a) with matrix colors ranging from 10YR (value of 2–4 and chroma of 1–2), 5Y 4/1, and 2.5Y (value of 2.5 and 5 and chroma of 1–2) (Appendix A). Data points commonly contained clay loam, silty clay, silty loam, silty clay loam and sandy loam. Soil samples were considered hydric when a positive primary indicator, such as redox depressions, depleted matrix, or loamy gleyed matrix was identified (data points W2–W7 in Appendix A). Estuarine wetland data point W1 confirmed the mapped hydric soil Wassents mucky silt loam (Appendix A). The soil matrix profile was 2.5Y and Gley 1 and confirmed hydric soils with hydrogen sulfide (A4) and loamy gleyed matrix (F2) (Appendix A). Estuarine wetland data point W8 contained a soil profile composed of sandy clay with significant redox features and closely resembled the mapped soil unit Anthraltic Xerorthents (Appendix A).

### 3.2.3 Vegetation

In undeveloped and restored areas, native vegetation is predominant. Vegetation communities documented in the Survey area include coastal scrub, riparian scrub, riparian forest, coastal and introduced grasslands, north coast salt marsh, and freshwater and brackish marshes. Stands of nonnative and landscaped vegetation were mostly observed along developed areas in the Survey area (e.g., roadside corridors, areas surrounding parking areas, and graveled low-use areas).

### 3.2.4 Precipitation

Local climate conditions are moist, cool, and influenced by the conditions of the Pacific Ocean, with wet cool winters and cool summers with frequent fog and strong winds. Rainfall occurs primarily between October through May, with mean annual rainfall ranging from 40–49 inches (based on the 1981–2010 period of record monthly normal [normal] for nearby Eureka WFO weather station) (NCDC 2019). The average monthly temperature range is approximately 46–49º F in winter and 54–59º F in the summer (NCDC 2019).

The Eureka WFO weather station recorded twice the normal monthly precipitation in September 2019 (i.e., 1.92 inches recorded in September 2019). The majority of which (i.e., 1.05 inches) was derived from a rain event two weeks preceding the initial field delineation in October 2019. No features from this precipitation event (i.e., ponding, high-water table, upper soil surface saturation) were observed, which indicated sufficient time had elapsed to drain shallow subsurface storm flow; as such, conditions were considered typical for the early October field delineation. Overall, the cumulative precipitation recorded for October 2019 (i.e., 1.51 inches) was below the normal average of 2.87 inches indicating conditions were drier for the month. However, the United States (U.S.) Drought Monitor did not indicate abnormally dry or drought conditions for Humboldt County in October 2019 (National Drought Mitigation Center 2019). Weather conditions during the October 2019 delineation varied from sunny and clear to scattered clouds with a high of 61–64º F, which was warmer than the Eureka WFO weather station normal average temperature of 54.4º F for October (NCDC 2019).

In March 2020, the Eureka WFO weather station recorded a total of 3.7 inches precipitation, less than the monthly normal (5.3 inches in March) (NCDC 2020). Low precipitation was recorded prior to the March 12, 2020 wetland delineation (0.1 inches accumulated since March 1) and the U.S. Drought Monitor indicated abnormally dry conditions for the region (National Drought Mitigation Center 2020). Weather was sunny with clear skies during the March 12, 2020 delineation with a high temperature of 56º F (within the monthly normal temperature range for March [43–57º F]).

The slightly drier and/or warmer conditions during the October 2019 and March 2020 wetland delineations are unlikely to have influenced the delineation results as wetland features remained evident regardless of precipitation and temperature throughout the Survey area.

Prior to the May 29, 2020 delineation, the Eureka WFO weather station recorded above normal precipitation for the month (<2 inches above normal). All recorded precipitation occurred between May 2 and May 18. Consequently, any temporarily saturated and/or ponded features from this period had sufficient time to drain prior to the May wetland delineation. As a result, the earlier precipitation events were not likely to have influenced delineation results.

## 3.3 Preliminary Jurisdictional Waters and Wetlands

The Survey area contains 3 acres of potentially USACE-jurisdictional waters of the U.S. and 2acres of potentially USACE-jurisdictional wetlands adjacent to these waters (Table 1, Figures 4 through 7 and 14, Appendix A). The potentially jurisdictional waters of the U.S. are also considered to be waters of the State under State- and LCP-jurisdiction. In addition, there are 10.87 acres of wetlands that are only subject to State- and LCP-jurisdiction (Table 1; Figures 4 through 9, 11, 13, and 14; Appendix A).

**Table 1.** Preliminary USACE-jurisdictional waters of the U.S., including wetlands, waters of the State, and LCP-jurisdictional wetlands in the Survey area.

| Description | Acreage |

### 3.3.1 Waters

The Survey area includes 3.0 acres of potential USACE- jurisdictional waters subject to Section 10 and/or Section 404 of the CWA (W-1 through W-6) as well as an additional 3.6 acres of non-federal waters of the State (SW-01 and SW-11) (Table 1, Figures 4, 6–9, 11, and 14).

#### 3.3.1.1 Waters of the U.S.

Tidal waters of the Arcata Bay section of Humboldt Bay are the Navigable Waters of the U.S. documented in the Survey area (W-1, Figure 6). Humboldt Bay includes the Port of Humboldt Bay, a protected deep-water port with harbor facilities designed to serve cargo and other vessels, and a number of marinas that serve hundreds of small to mid-size boats and pleasure crafts (Humboldt Bay Harbor, Recreation, and Conservation District 2019). Furthermore, commercial oyster production operations that produce more than half of all oysters farmed in California are located in Humboldt Bay (Pomeroy et al. 2010).

Navigable Waters of the U.S. in the Survey Area (W-1) were categorized by the MHW (Sections 10 and 404 waters) and the ground-truthed HTL (Section 404 waters) (Figure 6, Table 1). HTL indicators were a line of scum and wracking debris along the shore, as well as the transition of vegetated and unvegetated habitat (i.e., the boundary between open mudflat and north coast salt marsh). In cases where that HTL included north coast salt marsh habitat the HTL was adjusted to the lower extent of this habitat. The north coast salt marsh habitat was categorized as estuarine wetlands and is described in Section 3.2.2. The upland levee crest boundaries surrounding the man-made Klopp Lake were delineated and indicated on Figures 6, 10, and 11.

Other Waters of the U.S. in the Survey area totaled 2.7 acres and included the nontidal waters Western Pond, Brackish Pond, North Pond, and a roadside ditch along South G Street that connects to a tributary to Butcher Slough (W-2 through W-6, respectively; all Section 404 waters) (Table 1, Figures 4, 6, 7, and 14). Both Western Pond and Brackish Pond are excavated ponds that are separated from the adjacent tidal waters of McDaniel Slough and eventually the Arcata Bay section of Humboldt Bay by a constructed eco-levee. Water is exchanged between these water bodies through drainpipes and a tide gate in the eco-levee. North Pond (W-4) is manmade pond with no direct surface connection to nearby waterbodies. Future construction may connect this water to the Arcata Bay. The perennial roadside ditch along South G Street, W-5, connects to a tributary to Butcher Slough (W-6) and eventually the Arcata Bay (Figures 6 and 7). At all four locations, the OHWM was identified in the field by a change in slope, lack of vegetation, and/or change in vegetation.

#### 3.3.1.2 Waters of the State and LCP-jurisdictional waters

In addition to all potential USACE-jurisdictional waters described in Section 3.3.1.1, non-federal waters of the State totaled 3.6 acres in the Survey area and included the Arcata WWTP enhancement marshes (SW-01 and SW-02) and AWTF oxidation ponds and treatment marshes (SW-03 through SW-11) (Table 1, Figures 4, 7–9, and 11). These waters are also potential LCP-jurisdictional waters.

Hauser, Gearheart, and Allen enhancement marshes in or adjacent to the Survey area function as enhancement marshes that treat wastewater within the Arcata WWTP. Waters associated with these ponds eventually feedback into the AWTF prior to the receiving waters of the Arcata Bay. These marshes were composed of a mixture of open water and herbaceous emergent vegetation (i.e., *Typha latifolia* [broad-leaved cattail], *Schoenoplectus acutus* var. *occidentalis* [common

tule]). The primary OHWM indicators at these locations included a break in slope and changes in vegetation. Upland vegetation bordered the southern and eastern ends of Hauser Marsh (SW-02) and was best characterized by data point U6 (Appendix A, Figure 6). Vegetation was composed of *Pinus radiata* (Monterey pine, UPL) with an understory of nonnative grasses and forbs. This feature lacked both wetland hydrology and hydric soils.

The AWTF treatment marshes and oxidation ponds are bound by constructed upland levees. The upland levee crests were included in the Survey area. If any riparian vegetation was noted along the levee crest then the riparian canopy edge was delineated as the upland boundary (Figures 7 through 9).

### 3.3.2 Wetlands

There is a total of 2.0 acres of potential USACE-jurisdictional wetlands and an additional 7.2 acres of LCP-jurisdictional wetlands in the Survey area (Table 1; Figures 4–7, 11, 13, and 14; Appendix A).

Wetland types within the Survey area include both nontidal (i.e., palustrine seasonally saturated/flooded or semi-permanently flooded persistent emergent wetlands and palustrine seasonally saturated broadleaved deciduous scrub-shrub wetlands), and tidal (i.e., estuarine regularly flooded persistent emergent wetlands). FGDC (2013) defines the palustrine system as all nontidal wetlands dominated by trees, shrubs, persistent emergent plants, emergent mosses or lichens (i.e., non-vascular) and all similar wetlands that occur in tidal areas where salinity due to ocean-derived salts is below 0.5 parts per thousand. Estuarine system is defined as consisting of deepwater tidal habitats and adjacent tidal wetlands that are usually semi-enclosed by land but have open, partly obstructed, or sporadic access to the open ocean, and in which ocean water is at least occasionally diluted by freshwater runoff from the land. Emergent wetlands are characterized by erect, rooted herbaceous hydrophytes, excluding mosses and lichens, that are the tallest life form, have at least 30% areal coverage, and are present for most of the growing season in most years (FGDC 2013). Broadleaved deciduous scrub-shrub wetlands are characterized by woody plants of this leaf type that are less than 20 feet tall and are the dominant life form with at least 30% areal coverage (FGDC 2013).

In general, due to landscape position and historic land modification, delineated wetlands did not always border a vegetated upland and a wetland data point was not paired. All constructed features (e.g., paved and graveled roads, trails) in the Survey area were delineated as upland.

#### 3.3.2.1 USACE-jurisdictional wetlands

**Palustrine emergent wetlands**

There are five seasonally saturated palustrine emergent wetlands (0.7 ac), one semi-permanently flooded palustrine emergent wetland (<0.1 ac), and one seasonally flooded palustrine emergent wetland (0.4 ac)in the Survey area (Table 1).

*Seasonally saturated wetlands*

Three seasonally saturated wetlands were located in low gradient depressions between developed trails and South I Street near Gearheart Marsh (SS-01, SS-02, and SS-05, Figure 4). At these locations, vegetation varied from mixed facultative forbs and grasses (SS-01, SS-02) to a dense patch of *Carex obnupta* (slough sedge, OBL; SS-05). Data point W3 characterizes these palustrine emergent wetlands. Dominant vegetation at this location included *Symphyotrichum chilense* (common Pacific aster, FAC), *Juncus effusus* (soft rush, FACW), and *Agrostis capillaris*

(colonial bent, FAC); application of the dominance test using the "50/20 rule" confirmed hydrophytic vegetation was present. The soil profile consisted of clay loam that contained prominent redox concentrations (2–10%) within the upper 15 inches of the soil profile and confirmed the primary hydric soil indicator as redox depressions (F8). Wetland hydrology was established from the presence of oxidized rhizospheres along living roots (C3) (Appendix A). The paired upland data point S2 characterized a two-parameter wetland (TP-01) which lacked hydrophytic vegetation (Figure 4). Dominant upland vegetation at data point S2 included *Convolvulus arvensis* (bindweed, NL/UPL) and *Rubus ursinus* (California blackberry, UPL) (Appendix A).

Another seasonally saturated emergent wetland (SS-03) was located along a vegetated berm adjacent to Brackish Pond (W-2) (Figure 4). Wetland SS-03 is composed of a mixture of facultative plants (e.g., common Pacific aster, *Dipsacus fullonum* [wild teasel], and *Conium maculatum* [poison hemlock]) and upland coastal scrub species (*Baccharis pilularis* [coyote brush]). These facultative species tend to occur in disturbed and, at least periodic, saturated soils in the North Coast region. Some gravel fill was noted within the upper four inches and below 10 inches of the soil profile, however an intact soil horizon was observed within the sample (4–10 inches) and the primary hydric soil indicator of depleted matrix (F3) was confirmed (data point W5, Appendix A). The presence of this hydric soil indicated enough time had elapsed since the 2007 ground disturbance from the creation of Brackish Pond and the area was saturated for long enough period to develop redoximorphic features. Wetland hydrology was established from the presence of the primary indicator, oxidized rhizospheres along living roots (C3) (Appendix A). The upland boundary at this location was delineated by the parking and developed areas along South I Street as well as developed trails (Figure 4).

Seasonal-saturated wetland SS-04 was adjacent to Western Pond (W-3) near a potential mitigation area (Figure 14). Dominant hydrophytic vegetation included *Salix* spp. saplings (various willows, FAC and FACW), *Deschampsia cespitosa* (tufted hair grass, FACW), *Festuca arundinacea* (tall fescue, FAC), and colonial bent. Redoximorphic features within the upper 12 inches of the soil sample confirmed the hydric soil indicator redox dark surface (F6) and the presence of oxidized rhizospheres along living roots confirmed wetland hydrology at this location (Appendix A). Upland boundaries were defined by one- and two-parameter wetlands: OP-01, TP-07, TP-09 and TP-10 (Figure 14).

#### *Semi-permanently flooded wetlands*

A semi-permanently flooded wetland (SP-01) was delineated along the levee toeslope immediately adjacent to Brackish Pond (W-2) (Figure 4). Hydrophytic plant species at this location included common Pacific aster, *Atriplex prostrata* (fat-hen, FAC), *Potentilla anserina* subsp. *pacifica* (Pacific silverweed, OBL), and tufted hair grass. Overstory canopy included *Sequoia sempervirens* (coast redwood, NL/UPL) (data point W6, Appendix A). The soil profile consisted of silty clay loam that contained greater than 60% gleyed matrix and confirmed the primary hydric soil indicator as loamy gleyed matrix (F2). Wetland hydrology was established from the presence of a high-water table five inches from the soil surface with saturation extending to the surface of the soil pit (Appendix A). Wetland SP-01 was bordered by upland developed areas and the wetland SS-03 (Figure 4).

#### *Seasonally flooded wetlands*

The feature known as "No Name Pond" in the AMWS was previously delineated in 2010. This feature was classified as a seasonally flooded wetland (SF-01) during the May 2020 delineation. Review of aerial imagery over the last three decades indicate that most of the open water area in this wetland has since filled in with dense emergent vegetation. Vegetation was primarily

composed of *Typha latifolia* (broadleaved cattail). The northern extent of SF-01 is bound by the Humboldt Bay Trail and the easterly extent is bound by a segment of the AMWS trial network (Figure 6). *Rubus armeniacus* [Himalayan blackberry, FAC] along with other coastal scrub species (i.e., coyote brush, twinberry, California blackberry) form a dense upland thicket along the shoulder and backslope of the adjacent levee/trail prisms.

**Palustrine broadleaved deciduous scrub-shrub wetlands**

Palustrine broadleaved deciduous scrub-shrub wetlands, BL-01 through BL-04, totaled 0.6 acre in the Survey area. BL-01 was located along the seasonally saturated shoulder and backslope of the Hauser Marsh levee along South I Street Road (Figure 4). BL-02 extended along the west side of the Humboldt Bay Trail near the AWTF (Figure 7). BL-03 and BL-04 were just south of the Humboldt Bay Trail segment between AWTF and South I Street (Figure 5).

Canopy within wetland BL-01 included *Salix lasiolepis* (arroyo willow, FACW) and Sitka willow. Herbaceous understory species included nonnative facultative plants common to disturbed sites (i.e., *Trifolium repens* [white clover], *Lotus corniculatus* [bird's-foot trefoil], colonial bent, and *Festuca perennis* [rye grass, FAC]). Hydric soils were determined by the primary indicator depleted matrix and oxidized rhizospheres along living roots confirmed wetland hydrology (data point W4, Appendix A). No paired upland point was identified rather the upland region was delineated by the developed areas of South I Street (Figure 4).

Wetlands BL-02 and BL-03 were previously delineated in 2010 for the Humboldt Bay Trail (North) Project (see Wetland 12 and 14 *in* Winzler & Kelly 2010). Wetlands BL-02 through BL-04 receive seasonal runoff from the adjacent areas (i.e., trails, roadsides, and hillslope) and were primarily composed of woody vegetation (i.e., arroyo willow, *Morella californica* [wax myrtle, FACW], *Rubus ursinus* [California blackberry, FACU], Himalayan blackberry). As such, these features were typed as palustrine seasonally flooded broadleaved deciduous scrub-shrub wetlands during the 2020 delineations (Figures 5 and 7).

Wetland BL-02 formed a low-gradient drainage that connects to the estuarine wetland EP-02 (Figure 7). Riparian vegetation was mostly composed of arroyo willow and wax myrtle. Riparian canopy that extended beyond the drainage area was classified as one-parameter riparian wetlands, R-03 and R-04 (Figure 7). Adjacent upland habitat (UPL-05) was described by data point U4 which is composed of mostly nonnative upland grasses and lacks wetland hydrology and hydric soil indicators (Figure 7, Appendix A).

Wetland BL-03 included the low depressional ditch between the Humboldt Bay Trail and the historic landfill in the AMWS. It connects to the seasonally flooded wetland SF-03 through a culvert (Figure 5). This wetland was composed of arroyo willow, *Lonicera involucrata* (twinberry), *Sambucus racemosa* (red elderberry), and California and Himalayan blackberry. Wetland BL-04 is east of SS-05 and Hauser Marsh within a topographic low depression. It is composed of mostly arroyo willow, Himalayan blackberry, and slough sedge (Figure 5).

#### Estuarine persistent emergent wetlands

Estuarine persistent emergent wetlands (EP-01 and EP-02) in the Survey area contained north coast salt marsh habitat. Wetland EP-01 is regularly flooded by Arcata Bay tidal waters (W-01) (Figure 6). Hydrophytic salt marsh species observed within this wetland included *Salicornia pacifica* (common pickleweed, OBL), *Distichlis spicata* (salt grass, FACW), *Triglochin maritima* (common arrow-grass, OBL), *Jaumea carnosa* (marsh jaumea, OBL), *Spartina densiflora* (dense-flowered cord grass, OBL), fat-hen, tufted hair grass, and *Limonium californicum* (western marsh-rosemary, OBL) (data point W1, Appendix A). Anaerobic soils (e.g., hydrogen sulfide odor) along with other primary indicators (e.g., loamy gleyed matrix and a high-water table) confirmed hydric soils and wetland hydrology at data point W1 (Appendix A). This wetland is bordered by coastal scrub uplands (UPL-02, data point U1) composed of coyote brush, *Helminthotheca echioides* (bristly ox-tongue, FAC), *Rubus armeniacus* (Himalayan blackberry, FAC), California blackberry, poison hemlock, radish, common Pacific aster, and rye grass and one-parameter riparian habitat (R-01 and R-02) (Figure 6, Appendix A).

EP-02 was identified along the west side of the Humboldt Bay Trail (North) and connects to palustrine wetland BL-02 (Figure 7). This feature was located at the upper extent of the HTL and abuts Arcata Bay to the southeast (Figures 1 and 7). EP-02 is composed of north coast salt marsh species, characterized by data point W8 (Figure 7). Hydrophytic vegetation included high cover from tufted hair grass (Appendix A). The soil profile consisted of a matrix 2.5Y4/2–5/2 with high redox concentrations (30%) and depletions (5–15%) and confirmed the hydric soil indicator sandy redox (S5). A high water table was observed at 9.5 inches below the surface. Surrounding uplands, UPL-05, lacked hydric soils and wetland hydrology. Upland vegetation included *Dactylis glomerata* (orchard grass, FACU), *Anthoxanthum odoratum* (sweet vernal grass, FAC), and coyote brush (UPL). An additional upland data point (U5) was collected within the nearby vegetated areas of AWTF (Figure 7). No wetland parameters were observed at this location (Appendix A).

### 3.3.2.2 LCP-jurisdictional wetlands

In addition to all potential USACE-jurisdictional waters and adjacent wetlands described in Sections 3.2.1 and 3.2.2, an additional 6.9 acres of potential LCP-jurisdictional wetlands were identified in the Survey area (Table 1, Figures 4–7, 11, 13, and 14). Boundaries for these wetlands were delineated from data points with one or two positive primary wetland parameters located within the Coastal Zone. Table 2 provides the acreage of each delineated feature in the Survey area.

**Table 2.** Preliminary LCP-jurisdictional wetlands in the Survey area.

| OP-01 | 1.45 |
| **Overall** | **7.24** |

Two-parameter wetlands (TP-01 and TP-02) between South I Street and Gearheart Marsh lacked hydrophytic vegetation; however, both hydric soils and hydrology were observed (Figure 4). Dominant upland plant species included bindweed and California blackberry. This upland plant composition is likely due to the slightly higher topographic position of these features. TP-11 through TP-13 were similarly positioned along upper shoulder and crest of surrounding levees of Hauser Marsh and No Name Pond and mostly composed of California blackberry with some shrubs of Himalayan blackberry, red elderberry, twinberry, willow, and coyote brush (Figure 11). Additional two-parameter wetlands TP-03 through TP-06 were located in patches along a managed (i.e., mowed) vegetated area between Gearheart and Allen marshes (Figure 4). These wetlands were located along the lower end of the adjacent trail prism and all but TP-03 contained dominant hydrophytic vegetation comprised primarily by *Scirpus microcarpus* (small-fruited bulrush, OBL) with a mixture of facultative and upland species common to disturbed sites (i.e., rye grass, *Raphanus sativus* [radish, NL/UPL], Himalayan blackberry) (Appendix A). A small stand of *Picea sitchensis* (Sitka spruce, FAC) formed TP-03. These two-parameter wetlands were best characterized by data point S4 (Appendix A). Hydrophytic vegetation was dominant and wetland hydrology was confirmed by a high water table at 11.5 inch depth from surface, while

hydric soils were lacking. The upland boundary for these wetlands were delineated by parking and managed areas along South I Street and developed trails as well as by vegetated uplands (UPL-03) characterized by upland data point U2 (Figure 4). At this upland data point, vegetation was dominated by upland ruderal plant species including *Daucus carota* (wild carrot, FACU), rye grass, and radish; both hydric soil and wetland hydrology were lacking (Appendix A).

One- and two-parameter wetlands located at the potential mitigation area near Western Pond did not have wetland hydrology indicators within the sampled soil pits, indicating the water table and saturation were generally below 16 inches in depth but at or near the land surface for a duration sufficient to promote the formation of hydric soils (TP-07–TP-10) and/or to support the growth of hydrophytes (TP-07–TP-10, OP-01) (Appendix A, Figure 14). These wetlands are characterized by vegetation communities commonly associated with seasonally wet conditions including tall fescue meadows (TP-07), *Juncus lescurii* (San Francisco rush, FACW) swales (TP-08), and various aged willow stands (TP-10 [<5 years] and TP-09 [<10 years]). These vegetation communities are common to brackish marshes and low-gradient areas with some tidal influence. Data point S10 best characterizes TP-07 and TP-08 wetlands; data point S9 describes TP-09 and TP-10 (Appendix A). Uplands were delineated where the upland scrub species (e.g., California blackberry) (UPL-02 had established dominant cover and hydric soils and hydrology were lacking (data point U3, Appendix A; Figure 14).

One-parameter riparian wetlands in the Survey area include R-01 through R-13. Wetlands R-01 and R-02 were positioned along the crest and upper slopes of the AWTF levee along Butcher Slough and Arcata Bay (W-1) (Figure 6). Vegetation was primarily hydrophytic tree and shrub species including *Alnus rubra* (red alder, FACW), *Pinus contorta* subsp. *contorta* (shore pine, FAC), wax myrtle, and *Salix* spp. (various willows). The one-parameter riparian wetlands R-01 and R-02 were bound by uplands UPL-01 and UPL-02, which were often managed (i.e., mowed) and composed of upland ruderal herbaceous forbs and grasses (Figure 6, Appendix A). The riparian canopy that extended beyond the narrow drainages near the Humboldt Bay Trail (North) and South G street formed the one-parameter riparian wetlands R-03 and R-04 (Figure 7). The riparian canopy overhang from Allen Marsh was captured in R-14 which abutted the upland AMWS trail network (Figure 4).

The staging area on the northern end of South I Street contains several patches of one-parameter riparian wetlands composed of willow scrub (e.g., arroyo and shining willow) (R-05 through R-13, Figure 13). This staging area is primarily upland developed habitat containing graveled and paved roads as well as large vegetated mounds/spoil piles (Figure 13). Data point S11 best characterizes the one-parameter riparian wetlands observed at this location (Appendix A). Hydrophytic vegetation was dominant while both hydric soils and wetland hydrology were lacking. Other vegetated areas in this staging area were composed of upland ruderal herbaceous species (UPL-07; data point U6, Appendix A). Dominant vegetation at these locations included nonnative *Bromus hordeaceus* (soft chess, FACU), *Plantago lanceolata* (English plantain, FACU), and wild teasel (Appendix A).

### 3.3.3 Upland developed

Four staging areas were assessed during the March 12, 2020 wetland delineation. Except for the staging area along the northern end of South I Street (Figure 13), these features were paved and/or graveled areas with frequent use by the public (e.g., vehicle parking, access) and lacked wetland hydrology, hydrophytic vegetation and hydric soils (Figures 6, 11, and 12). In general, all paved and graveled areas in the Survey area were delineated as upland developed habitat. Data points U6 and U7 characterize the adjacent vegetated upland habitat for the two staging areas

along South I Street (Figures 11 and 13, Appendix A). These features contain upland grassland and coastal scrub species and Monterey pine. The adjacent vegetated habitats of the two staging areas along South G Street were not assessed as the Project activities will not extend beyond the paved/graveled features (Figures 6 and 12). All active trail networks and levee crests in the Survey area were delineated as upland developed habitat (Figures 4 through 11).

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement City/County: Arcata/ Humboldt Sampling Date: 10/2/2019

Applicant/Owner: City of Arcata State: CA Sampling Point: W1

Investigator(s): Emmalien Craydon/Emily King Teraoka Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): tidal marsh; toe slope along levee Local relief (concave, convex, none): none Slope (%): 0-2

Subregion (LRR): LRRA Lat: See EP-01 wetland; data point W1 in map Long: Datum: WGS 84

Soil Map Unit Name: Hydraquents - wassents mucky silt loam NWI classification: E2AB3M

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes X No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | |
|---|---|---|
| Hydrophytic Vegetation Present? | Yes X No _____ | **Is the Sampled Area within a Wetland?** Yes X No _____ |
| Hydric Soil Present? | Yes X No _____ | |
| Wetland Hydrology Present? | Yes X No _____ | |

Remarks:

All three wetland parameters are present in the sampled area. Sampled location is within salt marsh along Arcata Bay and is within the Coastal Zone.

### VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: 2m^2) | Absolute % Cover | Dominant Species? | Indicator Status |
|---|---|---|---|
| 1. | | | |
| 2. | | | |
| 3. | | | |
| 4. | | | |
| | 0 = Total Cover | | |
| **Sapling/Shrub Stratum** (Plot size: 2m^2) | | | |
| 1. | | | |
| 2. | | | |
| 3. | | | |
| 4. | | | |
| 5. | | | |
| | 0 = Total Cover | | |
| **Herb Stratum** (Plot size: 1m^2) | | | |
| 1. Spartina densiflora | 60 | Yes | |
| 2. Salicornia pacifica | 25 | Yes | |
| 3. Atriplex prostrata | 5 | | |
| 4. Deschampsia cespitosa | 5 | | |
| 5. Jaumea carnosa | 3 | | |
| 6. | | | |
| 7. | | | |
| 8. | | | |
| 9. | | | |
| 10. | | | |
| 11. | | | |
| | 98 = Total Cover | | |
| **Woody Vine Stratum** (Plot size: 1m^2) | | | |
| 1. | | | |
| 2. | | | |
| | 0 = Total Cover | | |

% Bare Ground in Herb Stratum 10

**Dominance Test worksheet:**

Number of Dominant Species That Are OBL, FACW, or FAC: 2 (A)

Total Number of Dominant Species Across All Strata: 2 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 100 (A/B)

**Prevalence Index worksheet:**

| Total % Cover of: | Multiply by: |
|---|---|
| OBL species _____ | x 1 = _____ |
| FACW species _____ | x 2 = _____ |
| FAC species _____ | x 3 = _____ |
| FACU species _____ | x 4 = _____ |
| UPL species _____ | x 5 = _____ |
| Column Totals: _____ (A) | _____ (B) |

Prevalence Index = B/A = _____

**Hydrophytic Vegetation Indicators:**

- ☐ 1 - Rapid Test for Hydrophytic Vegetation
- ☑ 2 - Dominance Test is >50%
- ☐ 3 - Prevalence Index is ≤3.0[1]
- ☐ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ☐ 5 - Wetland Non-Vascular Plants[1]
- ☐ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes X No _____

Remarks:

Dominant vegetation is composed of hydrophytic salt marsh species. Additional species include Distichlis spicata and Limonium californicum.

## SOIL

Sampling Point: W1

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

| Depth (inches) | Matrix Color (moist) | Matrix % | Redox Features Color (moist) | Redox Features % | Redox Features Type[1] | Redox Features Loc[2] | Texture | Remarks |
|---|---|---|---|---|---|---|---|---|
| 0-6 | 2.5Y 3/1 | 100 | | | | | mucky silt loam | w/ gravel fill |
| 6-14 | GLEY 14/N | 100 | | | | | mucky silt loam | w/ gravel fill |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

**Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)**

- ☐ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☑ Hydrogen Sulfide (A4)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Loamy Mucky Mineral (F1) (**except MLRA 1**)
- ☑ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)

**Indicators for Problematic Hydric Soils[3]:**

- ☐ 2 cm Muck (A10)
- ☐ Red Parent Material (TF2)
- ☐ Very Shallow Dark Surface (TF12)
- ☐ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

**Restrictive Layer (if present):**

Type: _____

Depth (inches): 14

**Hydric Soil Present?** Yes X No _____

Remarks:

Gleyed matrix colors confirmed hydric soil indicator loamy gleyed matrix. (Gravel/fill assoicated with adjacent levee) Confirmed Wassents - (Hydric soil)

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- ☐ Surface Water (A1)
- ☑ High Water Table (A2)
- ☑ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9) (**except MLRA 1, 2, 4A, and 4B**)
- ☐ Salt Crust (B11)
- ☐ Aquatic Invertebrates (B13)
- ☑ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Stunted or Stressed Plants (D1) (**LRR A**)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) (**MLRA 1, 2, 4A, and 4B**)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☑ Saturation Visible on Aerial Imagery (C9)
- ☑ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) (**LRR A**)
- ☐ Frost-Heave Hummocks (D7)

**Field Observations:**

Surface Water Present? Yes _____ No X Depth (inches): _____

Water Table Present? Yes X No _____ Depth (inches): 6" from surface

Saturation Present? (includes capillary fringe) Yes X No _____ Depth (inches): 6" to surface

**Wetland Hydrology Present?** Yes X No _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Arcata Bay tidelands (U.S. Coast Survey 1870)

Remarks:

Multiple primary and secondary indications of wetland hydrology present.

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement City/County: Arcata/ Humboldt Sampling Date: 10/8/2019

Applicant/Owner: City of Arcata State: CA Sampling Point: W2

Investigator(s): Emmalien Craydon/Emily King Teraoka Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): depression, diked former bay tidelands Local relief (concave, convex, none): concave Slope (%): 0

Subregion (LRR): LRRA Lat: see SS-01 wetland, data point W2 in map Long: Datum: WGS 84

Soil Map Unit Name: Water NWI classification: no listing

Are climatic / hydrologic conditions on the site typical for this time of year? Yes x No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes x No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | |
|---|---|---|
| Hydrophytic Vegetation Present? | Yes x No _____ | **Is the Sampled Area within a Wetland?** Yes x No _____ |
| Hydric Soil Present? | Yes x No _____ | |
| Wetland Hydrology Present? | Yes x No _____ | |

Remarks:

All three wetland parameters are present in the sampled area. Sampled location is within the Coastal Zone.

### VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: 2m2) | Absolute % Cover | Dominant Species? | Indicator Status |
|---|---|---|---|
| 1. | | | |
| 2. | | | |
| 3. | | | |
| 4. | | | |

| 1. | | | |
| 2. | | | |
| 3. | | | |
| 4. | | | |
| 5. | | | |
| | = Total Cover | | |
| **Herb Stratum** (Plot size: 2m2) | | | |
| 1. Bromus carinatus | 20 | YES | NL/UPL |
| 2. Holcus lanatus | 20 | YES | FAC |
| 3. Symphyotrichum chilense | 15 | YES | FAC |
| 4. Sonchus asper | 5 | NO | |
| 5. Equisetum arvense | 10 | NO | |
| 6. | | | |
| 7. | | | |
| 8. | | | |
| 9. | | | |
| 10. | | | |
| 11. | | | |
| | 70 = Total Cover | | |
| **Woody Vine Stratum** (Plot size: 2m2) | | | |
| 1. Rubus armeniacus | 10 | YES | FAC |
| 2. | | | |
| | 10 = Total Cover | | |

% Bare Ground in Herb Stratum 20

**Dominance Test worksheet:**

Number of Dominant Species That Are OBL, FACW, or FAC: 3 (A)

Total Number of Dominant Species Across All Strata: 4 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 75 (A/B)

**Prevalence Index worksheet:**

| Total % Cover of: | Multiply by: |
|---|---|
| OBL species _____ | x 1 = _____ |
| FACW species _____ | x 2 = _____ |
| FAC species _____ | x 3 = _____ |
| FACU species _____ | x 4 = _____ |
| UPL species _____ | x 5 = _____ |
| Column Totals: _____ (A) | _____ (B) |

Prevalence Index = B/A = _____

**Hydrophytic Vegetation Indicators:**

- ☐ 1 - Rapid Test for Hydrophytic Vegetation
- ☑ 2 - Dominance Test is >50%
- ☐ 3 - Prevalence Index is ≤3.0[1]
- ☐ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ☐ 5 - Wetland Non-Vascular Plants[1]
- ☐ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes x No _____

Remarks:

Dominant vegetation is primarily composed of facultative species and the dominance test passed for hydrophytic vegetation. Vegetation is routinely mowed, location between S. I Street and trail in the Arcata Marsh Wildlife Sanctuary.

## SOIL

Sampling Point: W2

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

| Depth (inches) | Matrix Color (moist) | % | Redox Features Color (moist) | % | Type[1] | Loc[2] | Texture | Remarks |
|---|---|---|---|---|---|---|---|---|
| 0-8 | 2.5Y 5/2 | 98 | 10YR 5/8 | 2 | C | PL | Clay loam | |
| 8-15 | 5Y 4/1 | 90 | 7.5 YR 4/6 | 10 | C | PL | Clay loam | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

**Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)**

- ☐ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Loamy Mucky Mineral (F1) (**except MLRA 1**)
- ☐ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☑ Redox Depressions (F8)

**Indicators for Problematic Hydric Soils[3]:**

- ☐ 2 cm Muck (A10)
- ☐ Red Parent Material (TF2)
- ☐ Very Shallow Dark Surface (TF12)
- ☐ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

**Restrictive Layer (if present):**

Type: _____

Depth (inches): _____

**Hydric Soil Present?** Yes X No _____

Remarks:

Located within a low depression, and redoximorphic features present in soil profiled confirming hydric soil indicator redox depressions.

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9) (**except MLRA 1, 2, 4A, and 4B**)
- ☐ Salt Crust (B11)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☑ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Stunted or Stressed Plants (D1) (**LRR A**)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) (**MLRA 1, 2, 4A, and 4B**)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) (**LRR A**)
- ☐ Frost-Heave Hummocks (D7)

**Field Observations:**

Surface Water Present? Yes _____ No X Depth (inches): _____

Water Table Present? Yes _____ No X Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No X Depth (inches): _____

**Wetland Hydrology Present?** Yes X No _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Historic bay tidelands (U.S. Coast Survey 1870); formerly diked with modified land use (pasture/industrial)

Remarks:

No high water table or saturation present at location however primary wetland hydrology indicator oxidized rhizospheres along living roots was evident.

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement City/County: Arcata/ Humboldt Sampling Date: 10/8/2019

Applicant/Owner: City of Arcata State: CA Sampling Point: W3

Investigator(s): Emmalien Craydon/Emily King Teraoka Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): depression, diked former bay tidelands Local relief (concave, convex, none): concave Slope (%): 0

Remarks:

Located within a low depression, and redoximorphic features present in soil profiled confirming hydric soil indicator redox depressions.

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9) (**except MLRA 1, 2, 4A, and 4B**)
- ☐ Salt Crust (B11)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☑ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Stunted or Stressed Plants (D1) (**LRR A**)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) (**MLRA 1, 2, 4A, and 4B**)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☑ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) (**LRR A**)
- ☐ Frost-Heave Hummocks (D7)

**Field Observations:**

Surface Water Present? Yes _____ No X Depth (inches): _____

Water Table Present? Yes _____ No X Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No X Depth (inches): _____

**Wetland Hydrology Present?** Yes X No _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Historic bay tidelands (U.S. Coast Survey 1870); formerly diked with modified land use (pasture/industrial)

Remarks:

No high water table or saturation present at location however primary wetland hydrology indicator oxidized rhizospheres along living roots was evident.

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement City/County: Arcata/ Humboldt Sampling Date: 10/8/2019

Applicant/Owner: City of Arcata State: CA Sampling Point: W4

Investigator(s): Emmalien Craydon/Emily King Teraoka Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): Vegetated levee (former bay tidelands, diked) Local relief (concave, convex, none): none Slope (%): 0-1

Subregion (LRR): LRRA Lat: See BL-01 wetland; data point W4 in maps Long: See GPS WPT 130 Datum: WGS 84

Soil Map Unit Name: Water NWI classification: no listing

Are climatic / hydrologic conditions on the site typical for this time of year? Yes x No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes x No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | |
|---|---|---|
| Hydrophytic Vegetation Present? | Yes x No _____ | **Is the Sampled Area within a Wetland?** Yes x No _____ |
| Hydric Soil Present? | Yes x No _____ | |
| Wetland Hydrology Present? | Yes x No _____ | |

Remarks:

All three wetland parameters are present in the sampled area. Sampled location is within the Coastal Zone. Area located between South I Street and Arcata WWTP Gearheart treatment marsh.

### VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: 3m2) | Absolute % Cover | Dominant Species? | Indicator Status |
|---|---|---|---|
| 1. Salix lasiolepis | 80 | Yes | FACW |
| 2. Salix (sitchensis) | 20 | Yes | FACW |
| 3. | | | |
| 4. | | | |
| | 80 = Total Cover | | |

| 1. Rubus armeniacus | 15 | Yes | FAC |
| 2. | | | |
| | 15 = Total Cover | | |

% Bare Ground in Herb Stratum 0

**Dominance Test worksheet:**

Number of Dominant Species That Are OBL, FACW, or FAC: 6 (A)

Total Number of Dominant Species Across All Strata: 6 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 100 (A/B)

**Prevalence Index worksheet:**

| Total % Cover of: | Multiply by: |
|---|---|
| OBL species _____ | x 1 = _____ |
| FACW species _____ | x 2 = _____ |
| FAC species _____ | x 3 = _____ |
| FACU species _____ | x 4 = _____ |
| UPL species _____ | x 5 = _____ |
| Column Totals: _____ (A) | _____ (B) |

Prevalence Index = B/A = _____

**Hydrophytic Vegetation Indicators:**

- ☐ 1 - Rapid Test for Hydrophytic Vegetation
- ☑ 2 - Dominance Test is >50%
- ☐ 3 - Prevalence Index is ≤3.0[1]
- ☐ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ☐ 5 - Wetland Non-Vascular Plants[1]
- ☐ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes x No _____

Remarks:

Dominant midstory canopy composed of fac-wet willow species; herbaceous vegetation is primarily composed of facultative species and the dominance test passed for hydrophytic vegetation. Regular vegetation management (mowing) immediately adjacent to S. I Street

## SOIL

Sampling Point: W4

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

| Depth (inches) | Matrix Color (moist) | Matrix % | Redox Features Color (moist) | Redox Features % | Redox Features Type[1] | Redox Features Loc[2] | Texture | Remarks |
|---|---|---|---|---|---|---|---|---|
| 0-6 | 10YR 4/2 | 100 | | | | | silty clay loam | |
| 6-15 | 10YR 4/1 | 10 | 10YR 6/1 | 50 | D | M | silty clay loam | |

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

**Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)**

- ☐ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Loamy Mucky Mineral (F1) (**except MLRA 1**)
- ☐ Loamy Gleyed Matrix (F2)
- ☑ Depleted Matrix (F3)
- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)

**Indicators for Problematic Hydric Soils[3]:**

- ☐ 2 cm Muck (A10)
- ☐ Red Parent Material (TF2)
- ☐ Very Shallow Dark Surface (TF12)
- ☐ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

**Restrictive Layer (if present):**

Type: _____

Depth (inches): _____

**Hydric Soil Present?** Yes X No _____

Remarks:

Soil profile contains a depleted matrix with redox concentrations.

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- ☐ Frost-Heave Hummocks (D7)

**Field Observations:**

Surface Water Present? Yes ____ No X Depth (inches): ____

Water Table Present? Yes X No ____ Depth (inches): 5" below surface

Saturation Present? (includes capillary fringe) Yes X No ____ Depth (inches): surface to below

**Wetland Hydrology Present?** Yes X No ____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Historic bay tidelands (U.S. Coast Survey 1870); formerly diked with modified land use (pasture/industrial)

Remarks:

A high water table and saturation present throughout the entire soil pit and wetland hydrology was confirmed at this location.

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement | City/County: Arcata/ Humboldt | Sampling Date: 10/2/2019

Applicant/Owner: City of Arcata | State: CA | Sampling Point: W7

Investigator(s): Emmalien Craydon/Emily King Teraoka | Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): Fringe of excavated pond | Local relief (concave, convex, none): concave edge | Slope (%): 1

Subregion (LRR): LRRA | Lat: See wetland SS-04; data point W7 | Long: | Datum: WGS 84

Soil Map Unit Name: Occidental, 0 to 2 percent slopes | NWI classification: PEM1D

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes X No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | |
|---|---|---|
| Hydrophytic Vegetation Present? | Yes X No _____ | **Is the Sampled Area within a Wetland?** Yes X No _____ |
| Hydric Soil Present? | Yes X No _____ | |
| Wetland Hydrology Present? | Yes X No _____ | |

Remarks:

All three wetland parameters are present in the sampled area. Sampled location is within the Coastal Zone. Adjacent to Western Pond.

### VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: 4m^2) | Absolute % Cover | Dominant Species? | Indicator Status |
|---|---|---|---|
| 1. | | | |
| 2. | | | |
| 3. | | | |
| 4. | | | |
| | 0 = Total Cover | | |

| **Herb Stratum (Plot size: 2m^2)** | | | |
| 1. Deschampsia cespitosa | 25 | Yes | FACW |
| 2. Festuca arundinacea | 30 | Yes | FAC |
| 3. Helminthotheca echioides | 10 | | |
| 4. Agrostis capillaris | 15 | Yes | FAC |
| 5. Achillea millefolium | 5 | | |
| 6. Plantago lanceolata | 5 | | |
| 7. Leontodon saxatilis | 5 | | |
| 8. Potentilla anserina | 2 | | |
| 9. Daucus carota | 15 | Yes | FACU |
| 10. Juncus effusus | 2 | | |
| 11. Lotus corniculatus | 5 | | |
| | 119 = Total Cover | | |
| **Woody Vine Stratum (Plot size: 2m^2)** | | | |
| 1. | | | |
| 2. | | | |
| | 0 = Total Cover | | |

% Bare Ground in Herb Stratum 0

**Dominance Test worksheet:**

Number of Dominant Species That Are OBL, FACW, or FAC: 4 (A)

Total Number of Dominant Species Across All Strata: 5 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 80 (A/B)

**Prevalence Index worksheet:**

| Total % Cover of: | Multiply by: |
|---|---|
| OBL species | x 1 = |
| FACW species | x 2 = |
| FAC species | x 3 = |
| FACU species | x 4 = |
| UPL species | x 5 = |
| Column Totals: (A) | (B) |

Prevalence Index = B/A = _____

**Hydrophytic Vegetation Indicators:**

- ☐ 1 - Rapid Test for Hydrophytic Vegetation
- ☑ 2 - Dominance Test is >50%
- ☐ 3 - Prevalence Index is ≤3.0[1]
- ☐ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ☐ 5 - Wetland Non-Vascular Plants[1]
- ☐ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes X No _____

Remarks:

Dominant vegetation is primarily composed of facultative species and the dominance test passed for hydrophytic vegetation.

## SOIL

Sampling Point: W7

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

| Depth (inches) | Matrix Color (moist) | % | Redox Features Color (moist) | % | Type[1] | Loc[2] | Texture | Remarks |
|---|---|---|---|---|---|---|---|---|
| 0-4 | 10YR 4/1 | 85 | 10YR 5/8 | 15 | C | PL | silty clay loam | |
| 4-12 | 2.5YR 2.5/1 | 95 | 2.5YR 4/8 | 5 | C | PL | silty clay | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

**Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)**

- ☐ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Loamy Mucky Mineral (F1) (**except MLRA 1**)
- ☐ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☑ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)

**Indicators for Problematic Hydric Soils[3]:**

- ☐ 2 cm Muck (A10)
- ☐ Red Parent Material (TF2)
- ☐ Very Shallow Dark Surface (TF12)
- ☐ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

**Restrictive Layer (if present):**

Type: _____

Depth (inches): _____

**Hydric Soil Present?** Yes X No _____

Remarks:

Soil profile matrix color's with redox concentrations confirms hydric soil indicator redox dark surface.

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9) (**except MLRA 1, 2, 4A, and 4B**)
- ☐ Salt Crust (B11)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☑ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Stunted or Stressed Plants (D1) (**LRR A**)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) (**MLRA 1, 2, 4A, and 4B**)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) (**LRR A**)
- ☐ Frost-Heave Hummocks (D7)

**Field Observations:**

Surface Water Present? Yes _____ No X Depth (inches): _____

Water Table Present? Yes _____ No X Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No X Depth (inches): _____

**Wetland Hydrology Present?** Yes X No _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Historic bay tidelands (U.S. Coast Survey 1870); formerly diked with modified land use (pasture/industrial); currently restored wetland along excavated/created Western Pond (McDaniel Slough Project)

Remarks:

No high water table or saturation present at location however primary wetland hydrology indicator oxidized rhizospheres along living roots was evident.

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement City/County: Arcata/ Humboldt Sampling Date: 3/12/2020

Applicant/Owner: City of Arcata State: CA Sampling Point: W8

Investigator(s): Emmalien Craydon/Emily King Teraoka Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): coastal marsh Local relief (concave, convex, none): concave Slope (%): 0

Subregion (LRR): LRRA Lat: see EP-02 Long: Datum: WGS 84

Soil Map Unit Name: Urban land-Anthraltic Xerorthents association, 0–2% slopes. NWI classification: none

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ____ No see notes (If no, explain in Remarks.)

Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes X No ____

Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | |
|---|---|---|
| Hydrophytic Vegetation Present? | Yes X No ____ | **Is the Sampled Area within a Wetland?** Yes X No ____ |
| Hydric Soil Present? | Yes X No ____ | |
| Wetland Hydrology Present? | Yes X No ____ | |

Remarks:

The sampled area is within an one-parameter wetland within the Coastal Zone/City of Arcata LCP-jurisdiction. Only hydrophytic vegetation observed at this location. Precipitation below monthly normal, abnormally dry conditions reported (Nat Drought Mit Center 2020)

### VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: 5m2) | Absolute % Cover | Dominant Species? | Indicator Status |

**Dominance Test worksheet:**

Number of Dominant Species That Are OBL, FACW, or FAC: 2 (A)

Total Number of Dominant Species Across All Strata: 3 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 67 (A/B)

**Prevalence Index worksheet:**

| Total % Cover of: | Multiply by: |
|---|---|
| OBL species ____ | x 1 = ____ |
| FACW species ____ | x 2 = ____ |
| FAC species ____ | x 3 = ____ |
| FACU species ____ | x 4 = ____ |
| UPL species ____ | x 5 = ____ |
| Column Totals: ____ (A) | ____ (B) |

Prevalence Index = B/A = ____

**Hydrophytic Vegetation Indicators:**

- ☐ 1 - Rapid Test for Hydrophytic Vegetation
- ☑ 2 - Dominance Test is >50%
- ☐ 3 - Prevalence Index is ≤3.0[1]
- ☐ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ☐ 5 - Wetland Non-Vascular Plants[1]
- ☐ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes X No ____

Remarks:

Dominance test passed for hydrophytic vegetation. Species composition is a mixture of saltmarsh species bordered by coyote brush and willow

## SOIL

Sampling Point: W8

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

| Depth (inches) | Matrix Color (moist) | % | Redox Features Color (moist) | % | Type[1] | Loc[2] | Texture | Remarks |

- ☐ Frost-Heave Hummocks (D7)

**Field Observations:**

Surface Water Present? Yes _____ No X Depth (inches): _____

Water Table Present? Yes X No _____ Depth (inches): 9.5" below surface

Saturation Present? (includes capillary fringe) Yes _____ No X Depth (inches): _____

**Wetland Hydrology Present?** Yes X No _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Historic bay tidelands (U.S. Coast Survey 1870); formerly diked with modified land use (industrial)

Remarks:

High water table within the upper 12 inches indicating wetland hydrology in the sampled area.

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement City/County: Arcata/ Humboldt Sampling Date: 5/29/2020

Applicant/Owner: City of Arcata State: CA Sampling Point: W9

Investigator(s): Emmalien Craydon/Emily King Teraoka Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): toeslope, drainage on artificial fill Local relief (concave, convex, none): concave Slope (%): 1

Subregion (LRR): LRRA Lat: See BL-03 Long: See GPS WPT Datum: WGS 84

Soil Map Unit Name: Water NWI classification: PSS1C

Are climatic / hydrologic conditions on the site typical for this time of year? Yes _____ No X (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes X No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

% Bare Ground in Herb Stratum 0

**Dominance Test worksheet:**

Number of Dominant Species That Are OBL, FACW, or FAC: 3 (A)

Total Number of Dominant Species Across All Strata: 4 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 75 (A/B)

**Prevalence Index worksheet:**

| Total % Cover of: | Multiply by: |
|---|---|
| OBL species _____ | x 1 = _____ |
| FACW species _____ | x 2 = _____ |
| FAC species _____ | x 3 = _____ |
| FACU species _____ | x 4 = _____ |
| UPL species _____ | x 5 = _____ |
| Column Totals: _____ (A) | _____ (B) |

Prevalence Index = B/A = _____

**Hydrophytic Vegetation Indicators:**

- ☐ 1 - Rapid Test for Hydrophytic Vegetation
- ☑ 2 - Dominance Test is >50%
- ☐ 3 - Prevalence Index is ≤3.0[1]
- ☐ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ☐ 5 - Wetland Non-Vascular Plants[1]
- ☐ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes X No _____

Remarks:

Dominant vegetation is primarily composed of facultative and fac-wet species and the dominance test passed for hydrophytic vegetation.

## SOIL

Sampling Point: S1

**Indicators for Problematic Hydric Soils[3]:**

- ☐ 2 cm Muck (A10)
- ☐ Red Parent Material (TF2)
- ☐ Very Shallow Dark Surface (TF12)
- ☐ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

**Restrictive Layer (if present):**

Type: _____

Depth (inches): _____

**Hydric Soil Present?** Yes _____ No X

Remarks:

No hydric soil indicators observed in sampled soil profile.

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9) (**except MLRA 1, 2, 4A, and 4B**)
- ☐ Salt Crust (B11)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Stunted or Stressed Plants (D1) (**LRR A**)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) (**MLRA 1, 2, 4A, and 4B**)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) (**LRR A**)
- ☐ Frost-Heave Hummocks (D7)

**Field Observations:**

Surface Water Present? Yes _____ No X Depth (inches): _____

Water Table Present? Yes _____ No X Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No X Depth (inches): _____

**Wetland Hydrology Present?** Yes _____ No X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Historic bay tidelands (U.S. Coast Survey 1870); formerly diked with modified land use (pasture/industrial)

Remarks:

No wetland hydrology indicators observed in sampled area.

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement City/County: Arcata/ Humboldt Sampling Date: 10/8/2019

Applicant/Owner: City of Arcata State: CA Sampling Point: S2

Investigator(s): Emmalien Craydon/Emily King Teraoka Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): depression (historic bay tidelands, diked ) Local relief (concave, convex, none): slight concave Slope (%): 1

Subregion (LRR): LRRA Lat: See TP-01 wetland; data point S2 in map Long: Datum: WGS 84

Soil Map Unit Name: Water NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes x No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes x No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | | |
|---|---|---|---|
| Hydrophytic Vegetation Present? | Yes _____ | No x | **Is the Sampled Area within a Wetland?** Yes _____ No x |
| Hydric Soil Present? | Yes x | No _____ | |
| Wetland Hydrology Present? | Yes x | No _____ | |

Remarks:

The sampled area is within a two-parameter wetland within the Coastal Zone/City of Arcata LCP-jurisdiction. Both hydric soil and wetland hydrology were identified, however dominant vegetation was composed of upland species.

### VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: 3m2) | Absolute % Cover | Dominant Species? | Indicator Status |

| | 30 = Total Cover | | |

% Bare Ground in Herb Stratum 0

**Dominance Test worksheet:**

Number of Dominant Species That Are OBL, FACW, or FAC: 0 (A)

Total Number of Dominant Species Across All Strata: 2 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 0 (A/B)

**Prevalence Index worksheet:**

| Total % Cover of: | Multiply by: |
|---|---|
| OBL species _____ | x 1 = _____ |
| FACW species _____ | x 2 = _____ |
| FAC species _____ | x 3 = _____ |
| FACU species _____ | x 4 = _____ |
| UPL species _____ | x 5 = _____ |
| Column Totals: _____ (A) | _____ (B) |

Prevalence Index = B/A = _____

**Hydrophytic Vegetation Indicators:**

- ☐ 1 - Rapid Test for Hydrophytic Vegetation
- ☐ 2 - Dominance Test is >50%
- ☐ 3 - Prevalence Index is ≤3.0[1]
- ☐ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ☐ 5 - Wetland Non-Vascular Plants[1]
- ☐ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes _____ No x

Remarks:

Dominant vegetation is not hydrophytic. Dominance test failed for hydrophytic vegetation. Vegetation is routinely mowed, location between S. I Street and trail in the Arcata Marsh Wildlife Sanctuary.

## SOIL

Sampling Point: S2

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

| Depth (inches) | Matrix Color (moist) | % | Redox Features Color (moist) | % | Type[1] | Loc[2] | Texture | Remarks |
|---|---|---|---|---|---|---|---|---|

**Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)**

- ☐ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Loamy Mucky Mineral (F1) (**except MLRA 1**)
- ☐ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)

**Indicators for Problematic Hydric Soils[3]:**

- ☐ 2 cm Muck (A10)
- ☐ Red Parent Material (TF2)
- ☐ Very Shallow Dark Surface (TF12)
- ☐ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

**Restrictive Layer (if present):**

Type: _____

Depth (inches): n/a

**Hydric Soil Present?** **Yes** _____ **No** X

Remarks:

No hydric soil indicators observed in sampled soil profile.

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- ☐ Surface Water (A1)
- ☑ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9) (**except MLRA 1, 2, 4A, and 4B**)
- ☐ Salt Crust (B11)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Stunted or Stressed Plants (D1) (**LRR A**)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) (**MLRA 1, 2, 4A, and 4B**)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) (**LRR A**)
- ☐ Frost-Heave Hummocks (D7)

**Field Observations:**

Surface Water Present? Yes _____ No X Depth (inches): _____

Water Table Present? Yes X No _____ Depth (inches): 11.5

Saturation Present? (includes capillary fringe) Yes _____ No X Depth (inches): _____

**Wetland Hydrology Present?** **Yes** X **No** _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Historic bay tidelands (U.S. Coast Survey 1870); formerly diked with modified land use (pasture/industrial); currently Arcata Marsh Wildlife Sanctuary

Remarks:

Water table present 11.5 inches below surface.

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement City/County: Arcata/ Humboldt Sampling Date: 10/3/2019

Applicant/Owner: City of Arcata/HSU State: CA Sampling Point: S5

Investigator(s): Emmalien Craydon/Emily King Teraoka Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): Diked former pasture (historic bay tidelands) Local relief (concave, convex, none): none Slope (%): 0

Subregion (LRR): LRRA Lat: See OP-01 wetland, Data point S5 in map Long: Datum: WGS 84

Soil Map Unit Name: Occidental, 0 to 2 percent slopes NWI classification: PEM1D

Are climatic / hydrologic conditions on the site typical for this time of year? Yes x No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes x No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | |
|---|---|---|
| Hydrophytic Vegetation Present? | Yes x No _____ | **Is the Sampled Area within a Wetland?** Yes _____ No x |
| Hydric Soil Present? | Yes _____ No x | |
| Wetland Hydrology Present? | Yes _____ No x | |

Remarks:

This location is a one-parameter wetland (only hydrophytic vegetation present) within the City of Arcata LCP-jurisdiction/Coastal Zone.

### VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: 4 m^2) | Absolute % Cover | Dominant Species? | Indicator Status |

| 2. | | | |
| | 0 = Total Cover | | |

% Bare Ground in Herb Stratum 0

**Dominance Test worksheet:**

Number of Dominant Species That Are OBL, FACW, or FAC: 1 (A)

Total Number of Dominant Species Across All Strata: 1 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 100 (A/B)

**Prevalence Index worksheet:**

| Total % Cover of: | Multiply by: |
|---|---|
| OBL species _____ | x 1 = _____ |
| FACW species _____ | x 2 = _____ |
| FAC species _____ | x 3 = _____ |
| FACU species _____ | x 4 = _____ |
| UPL species _____ | x 5 = _____ |
| Column Totals: _____ (A) | _____ (B) |

Prevalence Index = B/A = _____

**Hydrophytic Vegetation Indicators:**

- ☐ 1 - Rapid Test for Hydrophytic Vegetation
- ☑ 2 - Dominance Test is >50%
- ☐ 3 - Prevalence Index is ≤3.0[1]
- ☐ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ☐ 5 - Wetland Non-Vascular Plants[1]
- ☐ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes x No _____

Remarks:

Dominant vegetation is primarily composed of facultative species and the dominance test passed for hydrophytic vegetation.

## SOIL

Sampling Point: S5

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

| Depth (inches) | Matrix Color (moist) | Matrix % | Redox Features Color (moist) | Redox Features % | Type[1] | Loc[2] | Texture | Remarks |

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) (**MLRA 1, 2, 4A, and 4B**)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) (**LRR A**)
- ☐ Frost-Heave Hummocks (D7)

**Field Observations:**

Surface Water Present? Yes _____ No X Depth (inches): _____

Water Table Present? Yes _____ No X Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No X Depth (inches): _____

**Wetland Hydrology Present?** **Yes** _____ **No** X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Historic bay tidelands (U.S. Coast Survey 1870); formerly diked with modified land use (pasture/industrial)

Remarks:

No wetland hydrology indicators observed in sampled area.

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement City/County: Arcata/ Humboldt Sampling Date: 10/3/2019

Applicant/Owner: City of Arcata/HSU State: CA Sampling Point: S8

Investigator(s): Emmalien Craydon/Emily King Teraoka Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): Diked former pasture (historic bay tidelands) Local relief (concave, convex, none): none Slope (%): 0-2

Subregion (LRR): LRRA Lat: See OP-01 wetland, Data point S8 in map Long: Datum: WGS 84

Soil Map Unit Name: Occidental, 0 to 2 percent slopes NWI classification: PEM1D

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes X No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | |
|---|---|---|
| Hydrophytic Vegetation Present? | Yes X No _____ | **Is the Sampled Area within a Wetland?** Yes _____ No X |
| Hydric Soil Present? | Yes _____ No X | |
| Wetland Hydrology Present? | Yes _____ No X | |

Remarks:

This location is a one-parameter wetland (only hydrophytic vegetation present) within the City of Arcata LCP-jurisdiction/Coastal Zone.

### VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: 2m^2) | Absolute % Cover | Dominant Species? | Indicator Status |

% Bare Ground in Herb Stratum 0

**Dominance Test worksheet:**

Number of Dominant Species That Are OBL, FACW, or FAC: 2 (A)

Total Number of Dominant Species Across All Strata: 2 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 100 (A/B)

**Prevalence Index worksheet:**

| Total % Cover of: | Multiply by: |
|---|---|
| OBL species | x 1 = |
| FACW species | x 2 = |
| FAC species | x 3 = |
| FACU species | x 4 = |
| UPL species | x 5 = |
| Column Totals: (A) | (B) |

Prevalence Index = B/A = _____

**Hydrophytic Vegetation Indicators:**

- ☐ 1 - Rapid Test for Hydrophytic Vegetation
- ☑ 2 - Dominance Test is >50%
- ☐ 3 - Prevalence Index is ≤3.0[1]
- ☐ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ☐ 5 - Wetland Non-Vascular Plants[1]
- ☐ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes X No _____

Remarks:

Dominant vegetation is primarily composed of facultative species and the dominance test passed for hydrophytic vegetation.

## SOIL

Sampling Point: S8

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

| Depth (inches) | Matrix Color (moist) | Matrix % | Redox Features Color (moist) | Redox Features % | Type[1] | Loc[2] | Texture | Remarks |

- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)

**Indicators for Problematic Hydric Soils[3]:**

- ☐ 2 cm Muck (A10)
- ☐ Red Parent Material (TF2)
- ☐ Very Shallow Dark Surface (TF12)
- ☐ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

**Restrictive Layer (if present):**

Type: _____

Depth (inches): gravel/fill throughout

**Hydric Soil Present? Yes** _____ **No** X

Remarks:

No hydric soil indicators observed in sampled soil profile.

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9) (**except MLRA 1, 2, 4A, and 4B**)
- ☐ Salt Crust (B11)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Stunted or Stressed Plants (D1) (**LRR A**)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) (**MLRA 1, 2, 4A, and 4B**)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) (**LRR A**)
- ☐ Frost-Heave Hummocks (D7)

**Field Observations:**

Surface Water Present? Yes _____ No X Depth (inches): _____

Water Table Present? Yes _____ No X Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No X Depth (inches): _____

**Wetland Hydrology Present? Yes** _____ **No** X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Historic bay tidelands (U.S. Coast Survey 1870); formerly diked with modified land use (pasture/industrial)

Remarks:

No wetland hydrology indicators observed in sampled area.

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement City/County: Arcata/ Humboldt Sampling Date: 10/3/2019

Applicant/Owner: City of Arcata State: CA Sampling Point: S9

Investigator(s): Emmalien Craydon/Emily King Teraoka Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): Diked former pasture (historic bay tidelands) Local relief (concave, convex, none): none Slope (%): 0

Subregion (LRR): LRRA Lat: See TP-09 wetland, Data point S9 in map Long: Datum: WGS 84

Soil Map Unit Name: Occidental, 0 to 2 percent slopes NWI classification: PEM1D

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes X No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | | |
|---|---|---|---|
| Hydrophytic Vegetation Present? | Yes X | No _____ | **Is the Sampled Area within a Wetland?** Yes X No _____ |
| Hydric Soil Present? | Yes X | No _____ | |
| Wetland Hydrology Present? | Yes _____ | No X | |

Remarks:

The sampled area is within a two-parameter wetland within the Coastal Zone/City of Arcata LCP-jurisdiction. Both hydrophytic vegetation and hydric soils were identified and no wetland hydrology indicators were present. Restoration activities (willow plantings) fairly recent.

### VEGETATION – Use scientific names of plants.

| | 0 = Total Cover | | |

% Bare Ground in Herb Stratum 15

**Dominance Test worksheet:**

Number of Dominant Species That Are OBL, FACW, or FAC: 5 (A)

Total Number of Dominant Species Across All Strata: 7 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 71 (A/B)

**Prevalence Index worksheet:**

| Total % Cover of: | Multiply by: |
|---|---|
| OBL species ____ | x 1 = ____ |
| FACW species ____ | x 2 = ____ |
| FAC species ____ | x 3 = ____ |
| FACU species ____ | x 4 = ____ |
| UPL species ____ | x 5 = ____ |
| Column Totals: ____ (A) | ____ (B) |

Prevalence Index = B/A = ____

**Hydrophytic Vegetation Indicators:**

- ☐ 1 - Rapid Test for Hydrophytic Vegetation
- ☑ 2 - Dominance Test is >50%
- ☐ 3 - Prevalence Index is ≤3.0[1]
- ☐ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ☐ 5 - Wetland Non-Vascular Plants[1]
- ☐ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes X No ____

Remarks:

Dominance test passed for hydrophytic vegetation. Species composition is a mixture of willow with an understory of mostly herbaceous nonnative species.

## SOIL

Sampling Point: S11

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

| Depth (inches) | Matrix Color (moist) | Matrix % | Redox Features Color (moist) | Redox Features % | Type[1] | Loc[2] | Texture | Remarks |
|---|---|---|---|---|---|---|---|---|
| 0-9 | 10YR 3/1 | 100 | | | | | silty clay loam | contains gravel/fill |
| 9-12 | 10YR 3/1 | 98 | 10YR 4/6 | 2 | C | Pl | silty clay loam | contains gravel/fill |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

**Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)**

- ☐ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Loamy Mucky Mineral (F1) (**except MLRA 1**)
- ☐ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)

**Indicators for Problematic Hydric Soils[3]:**

- ☐ 2 cm Muck (A10)
- ☐ Red Parent Material (TF2)
- ☐ Very Shallow Dark Surface (TF12)
- ☐ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

**Restrictive Layer (if present):**

Type: _____

Depth (inches): _____

**Hydric Soil Present?** **Yes** _____ **No** X

Remarks:

Soil profile contains redox concentrations however located below 6 inches from surface and less than 3" in upper 12" of soil profile and a hydric soil indicator was not confirmed

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9) (**except MLRA 1, 2, 4A, and 4B**)
- ☐ Salt Crust (B11)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Stunted or Stressed Plants (D1) (**LRR A**)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) (**MLRA 1, 2, 4A, and 4B**)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) (**LRR A**)
- ☐ Frost-Heave Hummocks (D7)

**Field Observations:**

Surface Water Present? Yes _____ No X Depth (inches): _____

Water Table Present? Yes _____ No X Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No X Depth (inches): _____

**Wetland Hydrology Present?** **Yes** _____ **No** X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Historic bay tidelands (U.S. Coast Survey 1870); formerly diked with modified land use (industrial)

Remarks:

No wetland hydrology indicators observed in sampled area.

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement City/County: Arcata/ Humboldt Sampling Date: 10/2/2019

Applicant/Owner: City of Arcata State: CA Sampling Point: U1

Investigator(s): Emmalien Craydon/Emily King Teraoka Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): Fluviomarine terrace Local relief (concave, convex, none): none Slope (%): 1

Subregion (LRR): LRRA Lat: See UPL-01 upland; data point U1 in map Long: Datum: WGS 84

Soil Map Unit Name: Urban land-Anthraltic Xerorthents association, 0–2% slopes. NWI classification: No listing

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes X No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | | |
|---|---|---|---|
| Hydrophytic Vegetation Present? | Yes _____ | No X | **Is the Sampled Area within a Wetland?** Yes _____ No X |
| Hydric Soil Present? | Yes _____ | No X | |
| Wetland Hydrology Present? | Yes _____ | No X | |

Remarks:

No wetland parameters were present and the sampled area is within an upland.

### VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: 5 m^2) | Absolute % Cover | Dominant Species? | Indicator Status |
|---|---|---|---|
| 1. Pinus contorta ssp. contorta | 5 | No | |
| 2. Alnus rubra | 25 | Yes | FAC |
| 3. | | | |
| 4. | | | |
| | 30 | = Total Cover | |
| **Sapling/Shrub Stratum** (Plot size: 5 m^2) | | | |
| 1. Baccharis pilularis | 60 | Yes | NL-UPL |
| 2. Genista monspessulana | 10 | No | |
| 3. | | | |
| 4. | | | |
| 5. | | | |
| | 70 | = Total Cover | |
| **Herb Stratum** (Plot size: 5 m^2) | | | |
| 1. Symphyotrichum chilense | 8 | Yes | FAC |
| 2. Daucus carota | 8 | Yes | FACU |
| 3. Angelica lucida | 1 | No | |
| 4. Dipsacus fullonum | 5 | No | |
| 5. Avena barbata | 2 | No | |
| 6. Anthoxanthum odoratum | 10 | Yes | FACU |
| 7. Plantago lanceolata | 5 | No | |
| 8. Foeniculum vulgare | 3 | No | |
| 9. Festuca arundinacea | 2 | No | |
| 10. Cynosurus echinatus | 5 | No | |
| 11. | | | |
| | 49 | = Total Cover | |
| **Woody Vine Stratum** (Plot size: 5 m^2) | | | |
| 1. Rubus armeniacus | 45 | Yes | FAC |
| 2. | | | |
| | 45 | = Total Cover | |

% Bare Ground in Herb Stratum 45

**Dominance Test worksheet:**

Number of Dominant Species That Are OBL, FACW, or FAC: 3 (A)

Total Number of Dominant Species Across All Strata: 6 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 50 (A/B)

**Prevalence Index worksheet:**

| Total % Cover of: | Multiply by: |
|---|---|
| OBL species _____ | x 1 = _____ |
| FACW species _____ | x 2 = _____ |
| FAC species _____ | x 3 = _____ |
| FACU species _____ | x 4 = _____ |
| UPL species _____ | x 5 = _____ |
| Column Totals: _____ (A) | _____ (B) |

Prevalence Index = B/A = _____

**Hydrophytic Vegetation Indicators:**

- ☐ 1 - Rapid Test for Hydrophytic Vegetation
- ☐ 2 - Dominance Test is >50%
- ☐ 3 - Prevalence Index is ≤3.0[1]
- ☐ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ☐ 5 - Wetland Non-Vascular Plants[1]
- ☐ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes _____ No X

Remarks:

Dominance test not conclusive for hydrophytic vegetaiton and prevalence test not required since hydric soils and wetland hydrology were not observed. Based on dominant upland plant species composition, vegetation is considered upland.

## SOIL

- ☐ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ☐ 5 - Wetland Non-Vascular Plants[1]
- ☐ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes _____ No x

Remarks:

Dominance test failed for hydrophytic vegetation. Vegetative cover entirely comprised of the upland species California blackberry.

## SOIL

Sampling Point: U3

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

| Depth (inches) | Matrix Color (moist) | Matrix % | Redox Features Color (moist) | Redox Features % | Type[1] | Loc[2] | Texture | Remarks |
|---|---|---|---|---|---|---|---|---|
| 0-10 | 10YR 3/2 | 100 | | | | | silt loam | |
| 10-12 | 10YR 3/1 | 98 | 10YR 5/6 | 2 | C | PL | silt loam | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

**Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)**

- ☐ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Loamy Mucky Mineral (F1) (**except MLRA 1**)
- ☐ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)

**Indicators for Problematic Hydric Soils[3]:**

- ☐ 2 cm Muck (A10)
- ☐ Red Parent Material (TF2)
- ☐ Very Shallow Dark Surface (TF12)
- ☐ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

**Restrictive Layer (if present):**

Type: _____

Depth (inches): _____

**Hydric Soil Present?** **Yes** _____ **No** X

Remarks:

Although some redox features were present, the soil profile did not meet hydric soil indicator parameters.

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9) (**except MLRA 1, 2, 4A, and 4B**)
- ☐ Salt Crust (B11)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Stunted or Stressed Plants (D1) (**LRR A**)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) (**MLRA 1, 2, 4A, and 4B**)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) (**LRR A**)
- ☐ Frost-Heave Hummocks (D7)

**Field Observations:**

Surface Water Present? Yes _____ No X Depth (inches): _____

Water Table Present? Yes _____ No X Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No X Depth (inches): _____

**Wetland Hydrology Present?** **Yes** _____ **No** X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Historic bay tidelands (U.S. Coast Survey 1870); formerly diked with modified land use (pasture/industrial)

Remarks:

No wetland hydrology indicators observed in sampled area.

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement City/County: Arcata/ Humboldt Sampling Date: 3/12/2020

Applicant/Owner: City of Arcata State: CA Sampling Point: U4

Investigator(s): Emmalien Craydon/Emily King Teraoka Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): coastal plain Local relief (concave, convex, none): none Slope (%): 0

Subregion (LRR): LRRA Lat: see UPL-05 Long: Datum: WGS 84

Soil Map Unit Name: Urban land-Anthraltic Xerorthents association, 0–2% slopes NWI classification: none

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ____ No see notes (If no, explain in Remarks.)

Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes x No ____

Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | | |
|---|---|---|---|
| Hydrophytic Vegetation Present? | Yes ____ | No x | **Is the Sampled Area within a Wetland?** Yes ____ No x |
| Hydric Soil Present? | Yes ____ | No x | |
| Wetland Hydrology Present? | Yes ____ | No x | |

Remarks:

No wetland parameters were present and the sampled area is within an upland.

Precipitation below monthly normal, abnormally dry conditions reported (Nat Drought Mit Center

### VEGETATION – Use scientific names of plants.

Type: _____

Depth (inches): _____

**Hydric Soil Present?** **Yes** _____ **No** X

Remarks:

The soil profile did not meet hydric soil indicator parameters.

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9) (**except MLRA 1, 2, 4A, and 4B**)
- ☐ Salt Crust (B11)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Stunted or Stressed Plants (D1) (**LRR A**)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water-Stained Leaves (B9) (**MLRA 1, 2, 4A, and 4B**)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)
- ☐ Raised Ant Mounds (D6) (**LRR A**)
- ☐ Frost-Heave Hummocks (D7)

**Field Observations:**

Surface Water Present? Yes _____ No X Depth (inches): _____

Water Table Present? Yes _____ No X Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No X Depth (inches): _____

**Wetland Hydrology Present?** **Yes** _____ **No** X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Historic bay tidelands (U.S. Coast Survey 1870); formerly diked with modified land use (industrial)

Remarks:

No wetland hydrology indicators observed in sampled area.

## WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: City of Arcata WWTP Improvement City/County: Arcata/ Humboldt Sampling Date: 3/12/2020

Applicant/Owner: City of Arcata State: CA Sampling Point: U7

Investigator(s): Emmalien Craydon/Emily King Teraoka Section, Township, Range: CA T6N (R1E)

Landform (hillslope, terrace, etc.): coastal plain Local relief (concave, convex, none): none Slope (%): 0

Subregion (LRR): LRRA Lat: see UPL-07 Long: Datum: WGS 84

Soil Map Unit Name: Occidental, 0 to 2 percent slopes NWI classification: none

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ____ No see notes (If no, explain in Remarks.)

Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes x No ____

Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | | |
|---|---|---|---|
| Hydrophytic Vegetation Present? | Yes ____ | No x | **Is the Sampled Area within a Wetland?** Yes ____ No x |
| Hydric Soil Present? | Yes ____ | No x | |
| Wetland Hydrology Present? | Yes ____ | No x | |

Remarks:

No wetland parameters were present and the sampled area is within an upland.
Precipitation below monthly normal, abnormally dry conditions reported (Nat Drought Mit Center 2020)

### VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: 3 m^2) | Absolute % Cover | Dominant Species? | Indicator Status |

# 1.0 INTRODUCTION

This report presents the results of the Engineering Geologic and Hydrogeologic investigation performed by LACO Associates (LACO) for the City of Arcata (Client). The purpose of the investigation was to evaluate effluent seepage from the oxidation ponds located at the Arcata Waste Water Treatment Plant (WWTP), hereafter referred to as the Site, with respect to the proposed development of Treatment Marsh Number 7. A Site Location and Boring Map is presented as Figure 1.

The Arcata WWTP uses several passive and natural processes to clean the City's effluent to water quality objectives (WQO) regulated by the NCWQCB. The existing oxidation ponds are under consideration for expansion by the potential lowering of pond bottom elevations and the possibility of increasing levee crest elevation. The proposed modifications are intended to increase the treatment capacity for long term functionality. This functionality is related to an increase capacity to meet future loads; to increase levee height to account for sea level rise; to assess potential impacts of the modifications, such as increased head, increased seepage, and slope instability.

# 2.0 SCOPE OF SERVICES

In accordance with LACO's Proposal dated December 16, 2016, data was collected at the WWTP to evaluate hydraulic and geotechnical properties of pond and levee soils from January 11, 2017 to January 19, 2017, under the direction of a LACO Certified Engineering Geologist. The collection of data consisted of the following:

- Review of operational records provided by the City of Arcata staff:
  - oxidation pond water levels;
  - flows in and out of various ponds;
  - personal observations;
- Review of historic photos and relevant reports;
- Conducting a field exploration that included:
  - water level monitoring in oxidation pond number 2 for 8 days;
  - site visit to directly observe bay side levee toe;
  - collection and testing of soil samples from the levee system;
- Conducting laboratory testing for selected soil samples to characterize soil properties; and
- Preparing this Engineering Geologic and Hydrogeologic Report as requested by the City of Arcata.

# 3.0 FIELD EXPLORATION AND LABORATORY TESTING

The subsurface investigation performed on January 12 to January 19, 2017, included hand auguring, soil sampling, and logging of four exploratory borings at the approximate locations shown on Figure 1 – Site Map and Boring Locations. The boring locations were selected because of access, location near proposed Treatment Marsh 7 and spatial representation. The four borings were advanced to discrete depths to collect levee soil samples using a Shelby Tube. One boring, B4, was collected east and below the levee material. Once the desired depth was reached, a 12-inch Shelby tube was attached to a push rod and

driven into the boring no more than 12 inches with a slide hammer, ensuring that the rod was plumb with the boring.

In order to separate the sample from the underlying soil, a duration of 10 – 15 minutes was allotted in order for the soil to expand within the Shelby tube, then the tube was slowly rotated to shear the material at the end of the tube and to alleviate water and/or suction pressures and improve recovery. To improve recovery of highly cohesive and compressible bay mud underlying the levee, sampling was conducted at the base of a test pit. The test pit was dug with a backhoe to a depth of 8 feet in the area of the boring. The Shelby tube was then pushed to approximately 9 feet at which point the sample was excavated using the backhoe bucket; extreme care was given to ensure that the backhoe bucket went well below the Shelby tube during excavation. Once samples were pulled, the Shelby tubes were kept upright and detached from the push rod. Afterwards, the sample was inspected to ensure the target soil was present and any voids on the top or bottom were filled with nonabsorbent material and capped to ensure moisture was not lost. A LACO geologist logged the borings and obtained relatively undisturbed samples for laboratory testing. Soils were logged and collected in general accordance with the American Society for Testing and Materials (ASTM) Test Procedure D2488 and D1587. Boring logs are presented in Appendix 1.

# 4.0 SITE CONDITIONS

Located at the north end of Humboldt Bay, the WWTP occupies 307 acres of the Arcata Marsh and Wildlife Sanctuary. The marsh and sanctuary includes freshwater marshes, saltwater marches, tidal sloughs, grassy uplands, mudflats, and brackish mash (Arcata Marsh & Wildlife Sanctuary, 2017). The facility contains a series of oxidation ponds, treatment wetlands, and enhancement marshes that are used to treat wastewater before discharging the effluent into Humboldt Bay.

## 4.1 Soils

Although the facility was developed on historic tidal flats consisting of 20 - 30 feet of bay mud deposits on the northern section of Humboldt Bay, there are historic channels, creeks, and sloughs which traverse the area, potentially associated with granular soils that have a significantly higher permeability than the bay mud deposits which may affect flux between the oxidation ponds and bay.

# 5.0 SEEPAGE INVESTIGATION

## 5.1 Document Review

The document review consisted of reviewing operational records provided by city staff. Records included original levee plans and personal observations. The review also included reviewing historic photos and relevant reports.

Prior to the construction of the WWTP in 1949, the area north Humboldt Bay was an undeveloped tidal flat which appears to have been crossed by a several potential channels including but not limited to the Jolly Giant Creek and portions of McDaniel Slough. These potential channels may represent areas of potentially high permeability sediments within the low permeability tidal muds. The potentially higher permeability

sediments were located using the original levee plans and historic aerial photographs from the Historic Atlas of Humboldt Bay and Eel River Delta between 1931 and 1969. Approximately five potential channels appear to have existed before the construction of the oxidation ponds and levees. These historic channels were mapped in GIS and labeled according to corresponding year as seen in Figure 2.

## 5.2 Permeability Sampling and Analysis

Relatively undisturbed samples collected during field exploration were submitted to a state certified laboratory. Laboratory testing was performed to estimate permeability of the levee soils.

Laboratory test results are included as Appendix 2 and are summarized in Table 1.

*Table 1: Laboratory Test Results*

| Boring | Sampling Method | Sampling Depth (bgs) | Side of Levee | Hydraulic Conductivity (cm/s) |
|---|---|---|---|---|
| B1 | Hand auger/Shelby tube | 4.7 – 5.7 | Pond side | 3.0E-07 |
| B2 | | 2.5 – 3.5 | Bay side | 2.0E-06 |
| B3 | | 3.25 – 4.25 | Pond side | 1.0E-06 |
| B4 | | 8.0 – 9.0 | Pond Side | 8.0E-08 |

## 5.3 Thermal and Visual Observations

The levee evaluation also included visual observation with the aid of Flir t420 thermal camera. The camera was used scan for flowing water near the levee toe during low tide. Several areas of flow were noted around the levee, from approximately Dr. Gearheart's office to approximately the old outwash, predominately near the southwest corner of Oxidation Pond Number 1 (Figure 2). Several thermal images (Appendix 3) record the observed flow and we estimated a maximum discharge rate of no more than 0.1 gallon per minute.

## 5.4 Water Level Monitoring

A pressure transducer (Hobo Logger) was installed to a depth of approximately 4 feet below the water surface in Oxidation Pond Number. The Hobo Logger collected pressure and temperature data every 15 minutes from January 11 to January 18, 2017. Upon retrieval of the pressure transducer, data was downloaded and pressure measurements were corrected for atmospheric noise; atmospheric pressure was subtracted from the pressure measurements thereby eliminating the low and high pressure weather system influence on the data. Both pressure and tide were graphed versus time to see if any correlation or tidal influence on the ponds exists. Each comparison consisted of a 24 hour period and for several days (Appendix 4).

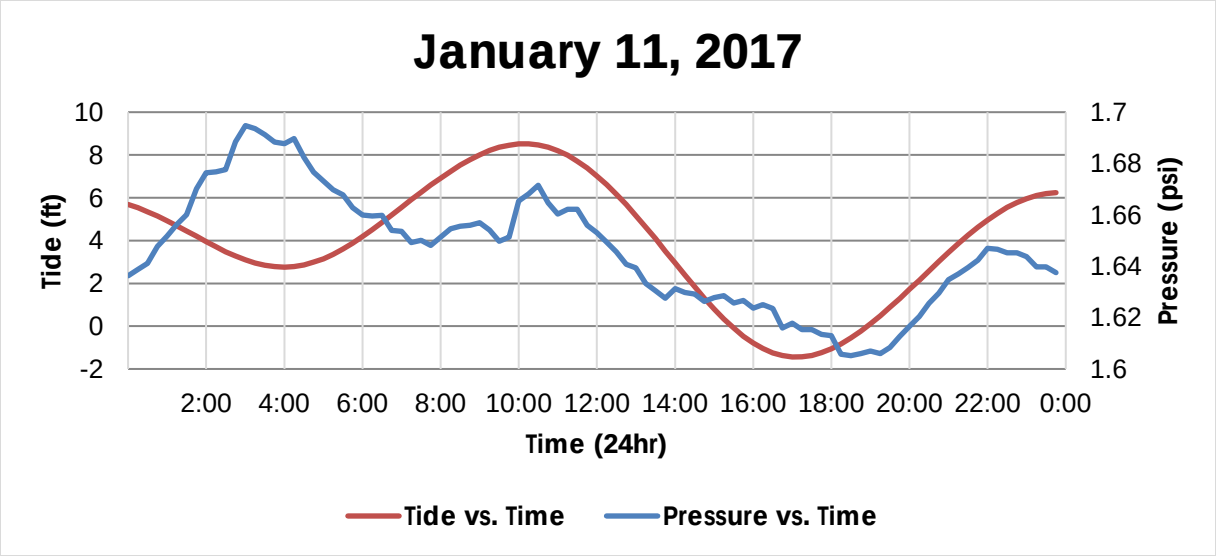

**Figure A: Daily tidal cycle and Oxidation Pond #2 pressure measurements**

The daily comparison of tide and pressure from January 11, 2017, to January 18, 2017, correlates, but further evaluation is needed to check the potential magnitude of flux between the oxidation ponds and bay. Figure A depicts the correlation between tide and pond pressure. However, given the flownet estimation and calculations with the measured hydraulic conductivity from B3, the theoretical likelihood is that seepage through the levee, using the highest hydraulic conductivity value from B3 is 267 gallons per day per hundred feet of levee. A complete daily tide and pressure versus time graphs are located in Appendix 3.

## 6.0 LEVEE SLOPE INSTABILITY ANALYSIS

The impact on levee stability of the proposed improvements was evaluated by constructing a series of quantitative slope instability analysis models. Existing levee geometry was taken from three representative cross-sections at stations 16+00, 31+00 and 39+00, chosen for their proximity to borings conducted as part of this and previous (LACO, 2009) exploration reports. The resulting geologic cross-sections were modified by the addition of 3 feet of fill to the crown and in-board pond slopes.

The pre-modification levee topography for the three sections was based on levee sections prepared as part of a civil design set, dated June 9, 2009, prepared, by LACO as part of the Arcata Levee Repair Project. Pond bathymetry and depth of sludge were incorporated from measurements made by Jeff Woodke, of Humboldt State University.

Soil engineering properties included in the model, such as density, cohesion, and friction angle were either measured directly by laboratory analysis (LACO, 2009), estimated based on a combination of Standard Penetration Test (SPT) data and grain-size analysis following procedures outlined in the 2013 Caltrans Geotechnical Manual (after Bowles 1977), or by engineering judgment and experience with local soils. The material divisions used broadly follow those used by the 2009 report with the addition of a unit representing unconsolidated bay mud. Material parameters used are presented in Table 2 below:

*Table 2. Instability Analysis Material Parameters*

| Material | Description | Unit Weight (lb/ft3) | Cohesion (psf) | Friction Angle (degrees) |
|---|---|---|---|---|
| 1 | Proposed Fill | 100 | 800 | 16 |
| 2 | Existing Revetment | 140 | 0 | 50 |
| 3 | Existing Granular Levee Fill | 132 | 0 | 35 |
| 4 | Existing Fine Grained Fill | 108 | 1000 | 25 |
| 5 | Unconsolidated Bay Mud | 100 | 400 | 0 |
| 6 | Partially Consolidated Bay Mud | 100 | 800 | 16 |

To provide an assessment of the full range of conditions that may occur during the design life of the levee, seismic slope stability analyses were run. The impacts of a design level earthquake on slope stability were estimated using the pseudo-static approach, where the earthquake load is simulated by "equivalent" static horizontal acceleration acting on the mass of the landslide. The pseudo-static seismic loading coefficient was calculated in accordance with guidelines presented in California Geologic Survey Special Publication 117A, and Note 48 using a 6.9 magnitude earthquake on the Fickle Hill Fault Zone.

The analyses were performed using the computer program Slide 7.0. The analyses utilized the Modified Bishop method to search for the critical failure surface and calculate the factor of safety against sliding. The critical failure surface is defined as the surface with the lowest calculated factor of safety. In general, factors of safety greater than 1.0 indicate stable conditions, while factors of safety less than 1.0 indicated an unstable condition.

The following worst case scenarios were considered in the slope instability models:

- A design level earthquake, at low tide with the ponds filled to 1 foot below the levee crown; and
- A design level earthquake, with the ponds empty, and high tide 1 foot below the levee crown.

The results of our analysis are presented in Appendix 5 The slope stability analysis for each of the sections, run for the high tide, empty pond scenario, generated critical failure surfaces (the surface with the lowest factor of safety) extending through the bay mud under the levee prism to a toe surfacing within the pond. The resulting failure surfaces had pseudo-static factors of safety ranging from 1.33 to 1.49. The slope stability analysis for each of the sections run for the low tide, full pond scenario, generated critical failure surfaces, initiating on the levee slope within the pond and surfacing in the tidal flat approximately 30 to 50 feet from the levee toe. The resulting failure surfaces had had pseudo-static factors of safety ranging from 1.45 to 1.71. Based on CGS Special Publication 117A guild-lines Pseudo-Static analysis with a factor of safety of greater than 1 is considered stable.

# 7.0 CONCLUSIONS AND RECOMMEDATIONS

- Construction of additional treatment facilities inside the levee system will not result in a measureable discharge of untreated effluent to the bay through or under the levee system. A project specific geotechnical report is recommended to develop earthwork recommendations.

- Construction of improvements to increase the height of the levee crest using bay mud deposits is feasible. A project specific geotechnical report is recommended to develop earthwork recommendations.

- Average theoretical seepage from the oxidation ponds to the bay through the levee materials is insignificant (0.01 gpm for the entire levee system) and the rate of movement (<1 foot/year) is such that any seepage would likely result in attenuation of wastewater constituents to below regulated levels.

- There is a potential for preferential seepage from the oxidation ponds to the bay through higher permeability sediments within and below the levee system. While flow on the order of 0.1 gallons per minute was observed at the levee toe during low tide at several locations, the source of flow was not confirmed. Several sources for the flow exist which are not mutually exclusive: 1) discharge of infiltrated rainwater; 2) discharge of bay water trapped behind the geotextile located under the rip-rap; 3) effluent seepage through the levee; and 4) effluent seepage under the levee. Chemical testing of the flow is recommended to aid in its characterization.

Remarks:

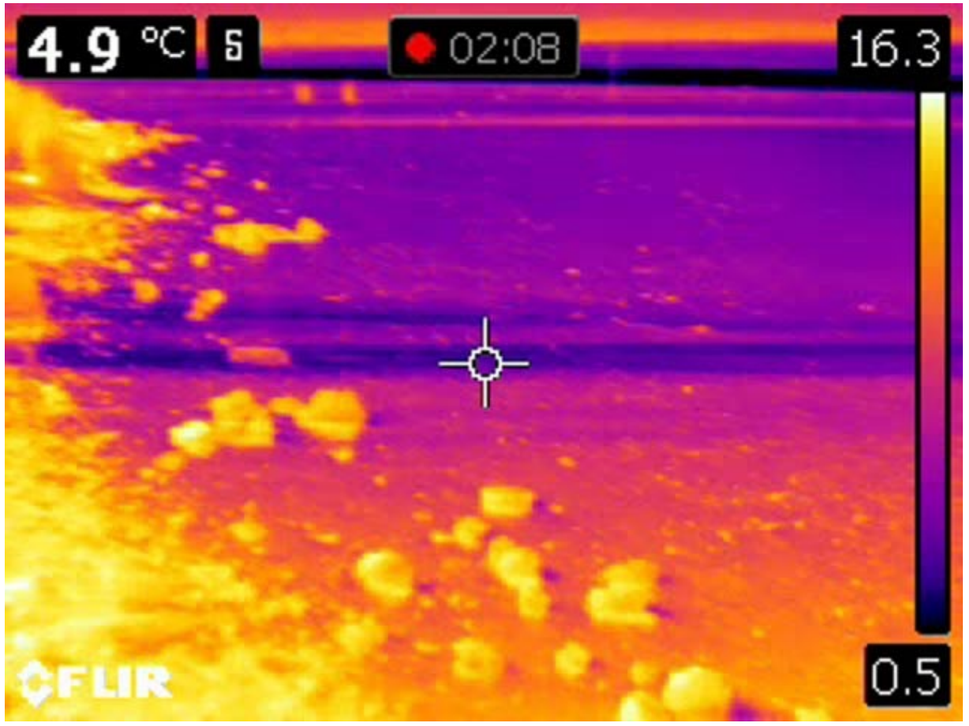
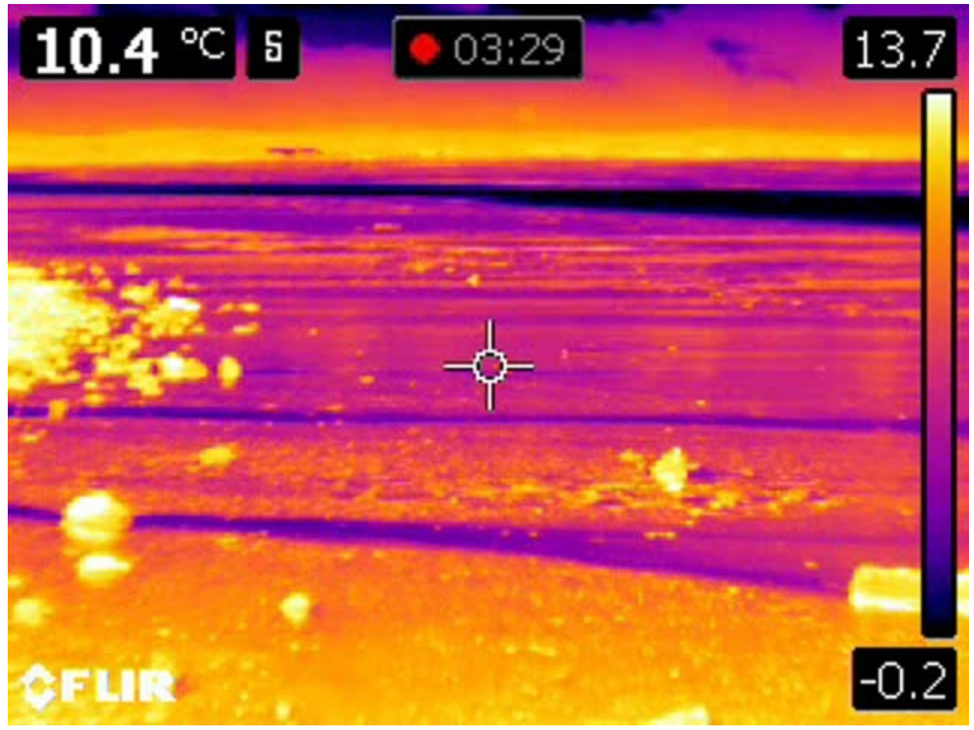
# APPENDIX 3

## Thermal Images of Possible Seeps

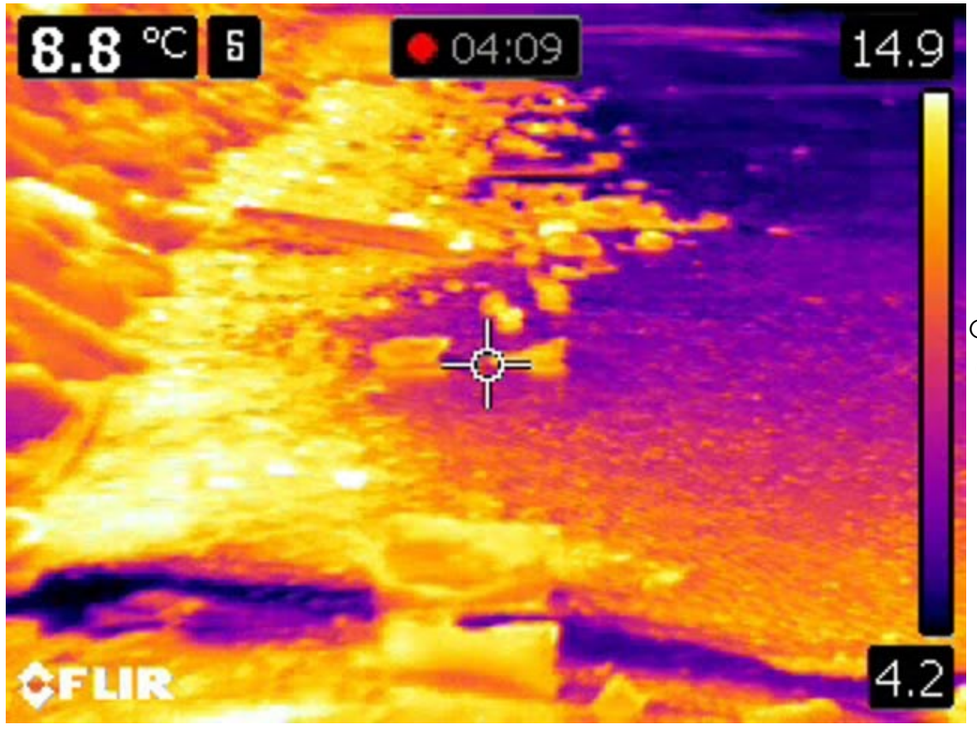
Possible Seep 1: approximately 450 feet from outfall



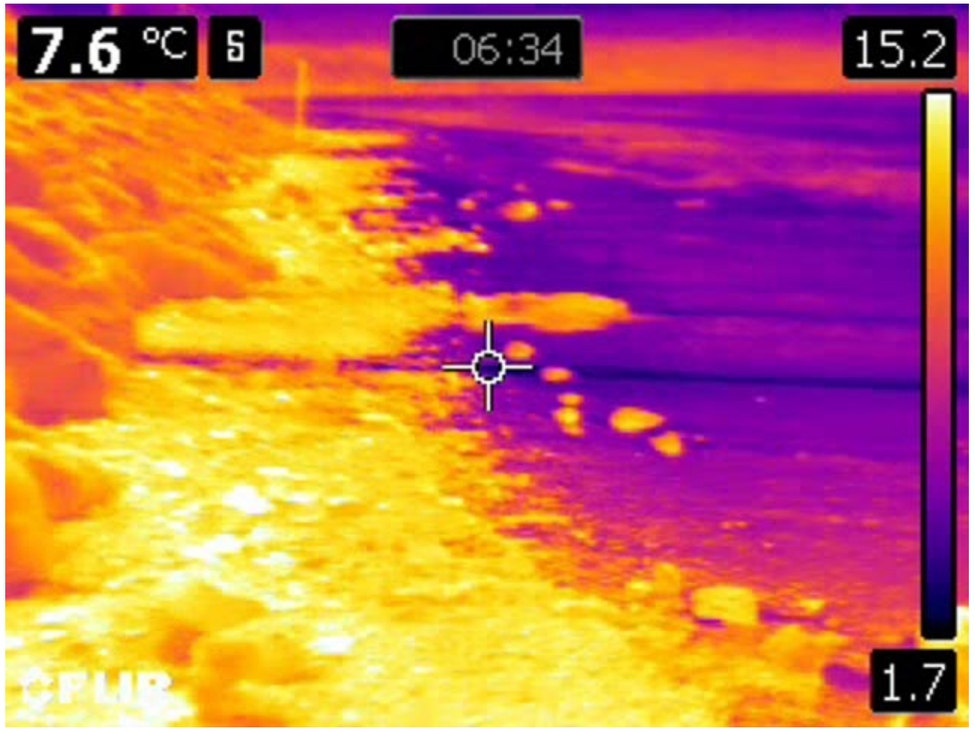
Possible Seep 2: approximately 480 feet from outfall



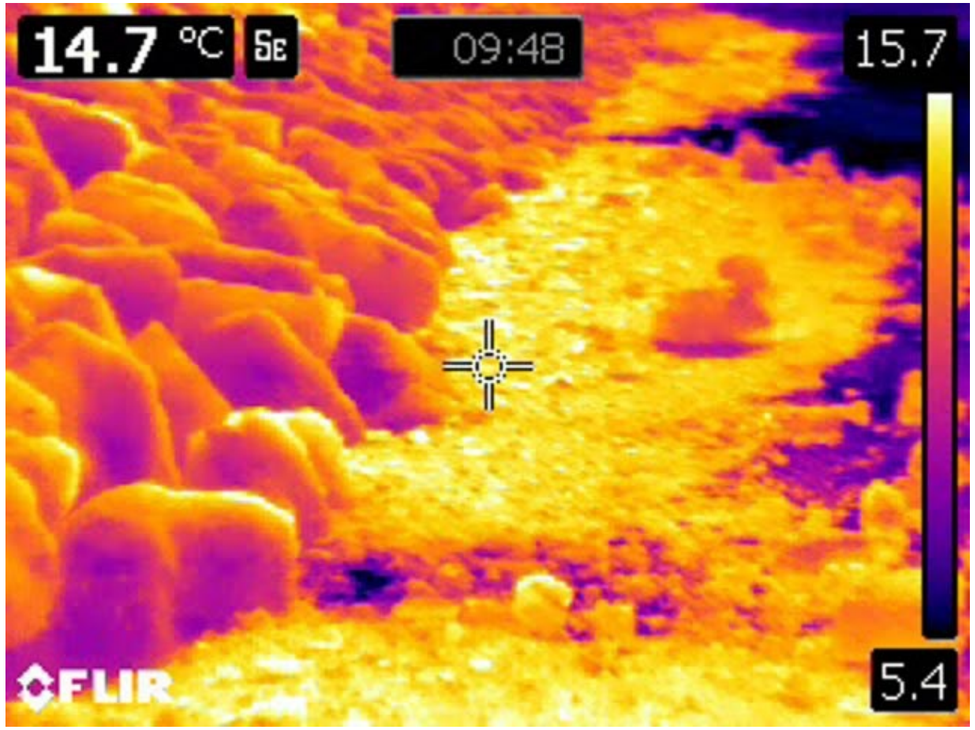
Other Channel noted by thermal observation



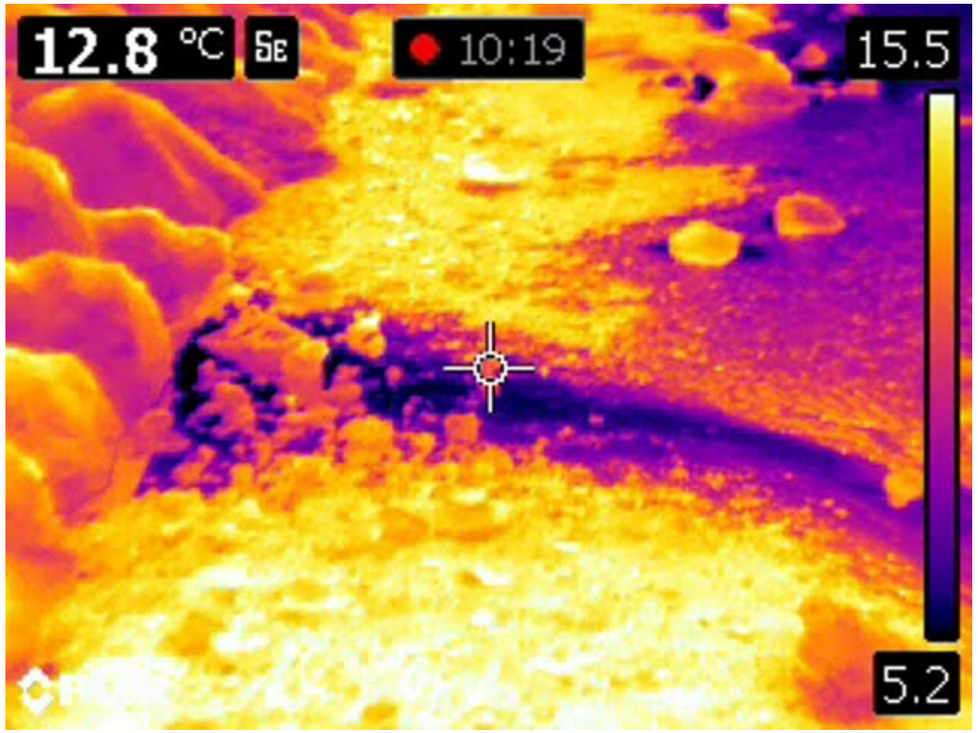
Other Channel noted by thermal observation



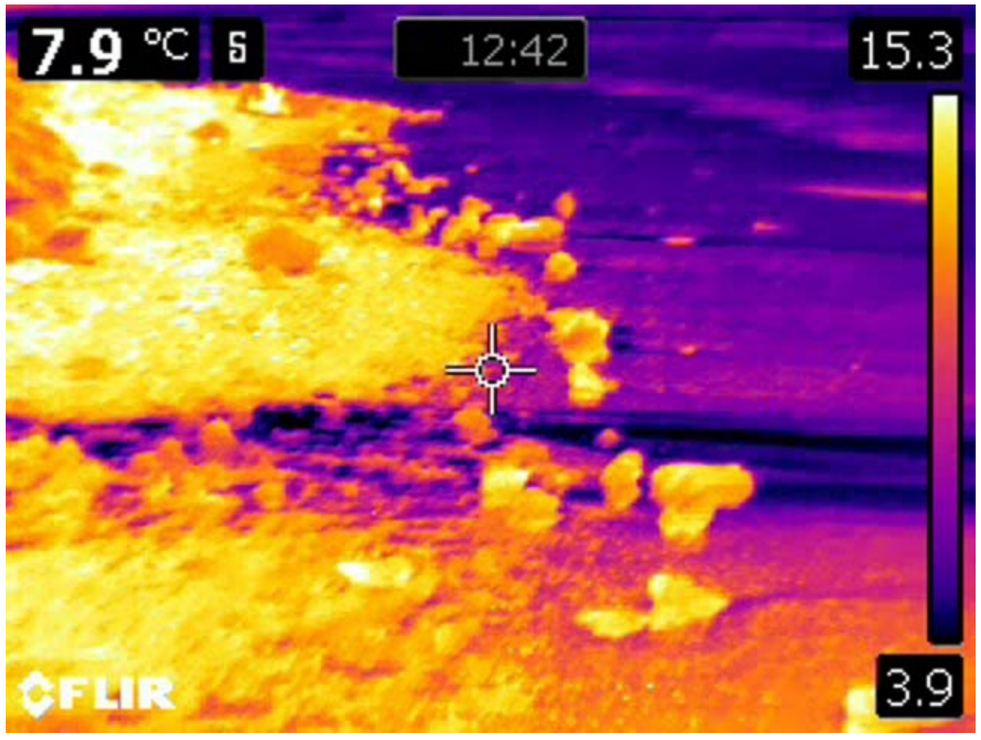
Possible Seep 3: approximately 1,500 feet from outfall



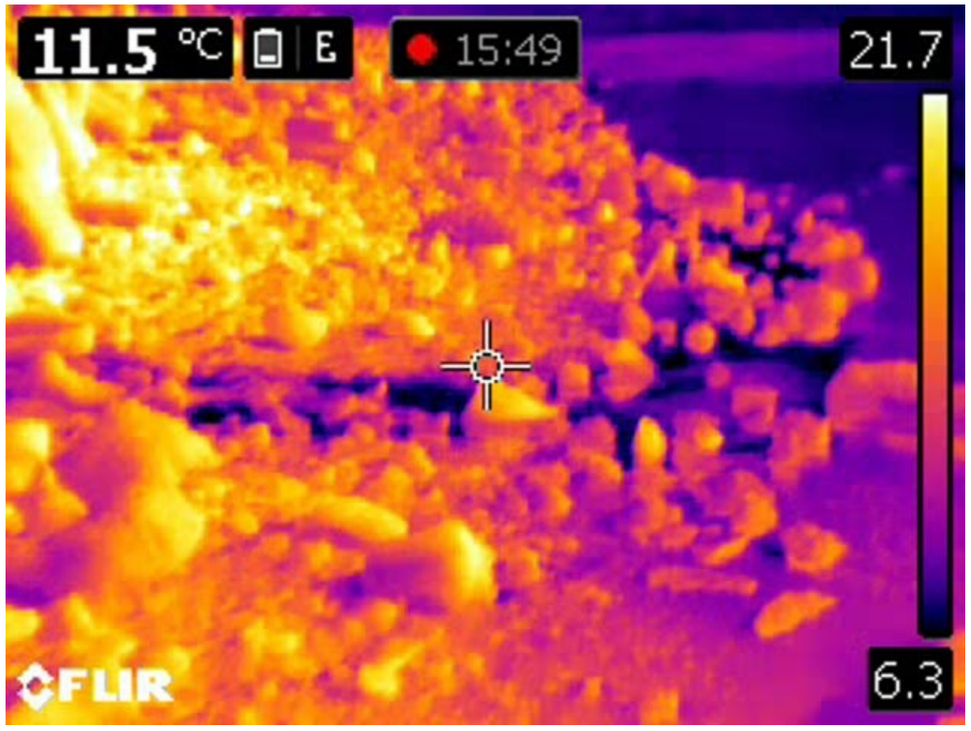
Possible Seep 4: approximately 1,700 feet from outfall



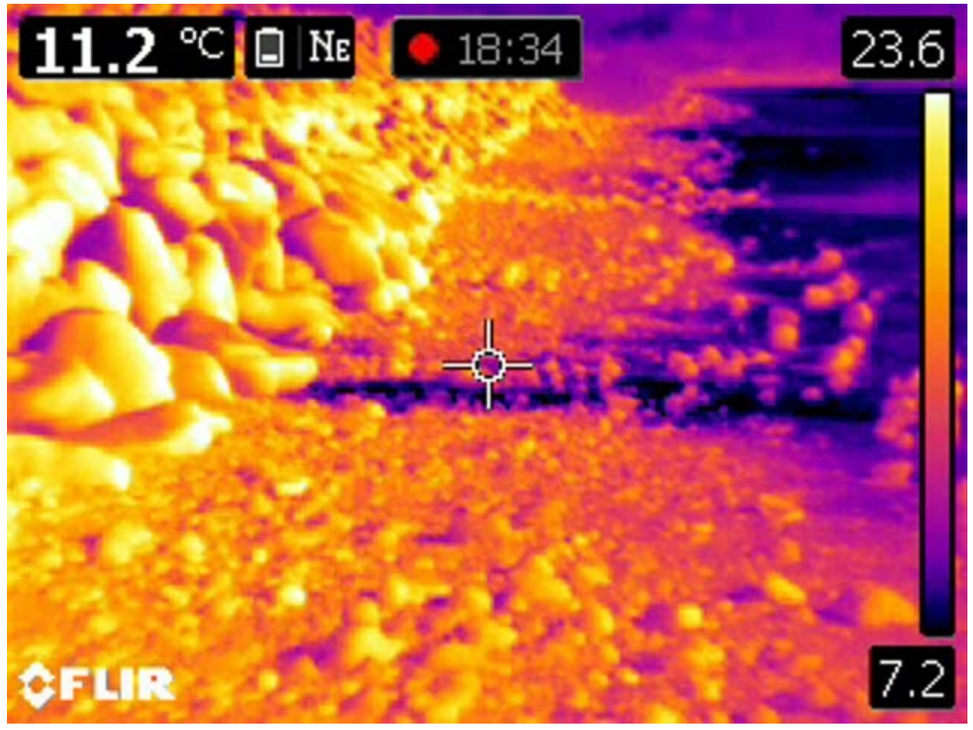
Possible Seep 5: approximately 1,740 feet from outfall



Possible Seep 6: approximately 1,750 feet from outfall



Possible Seep 7: approximately 900 feet from old out-fall



Possible Seep 8: approximately 530 feet from old outfall

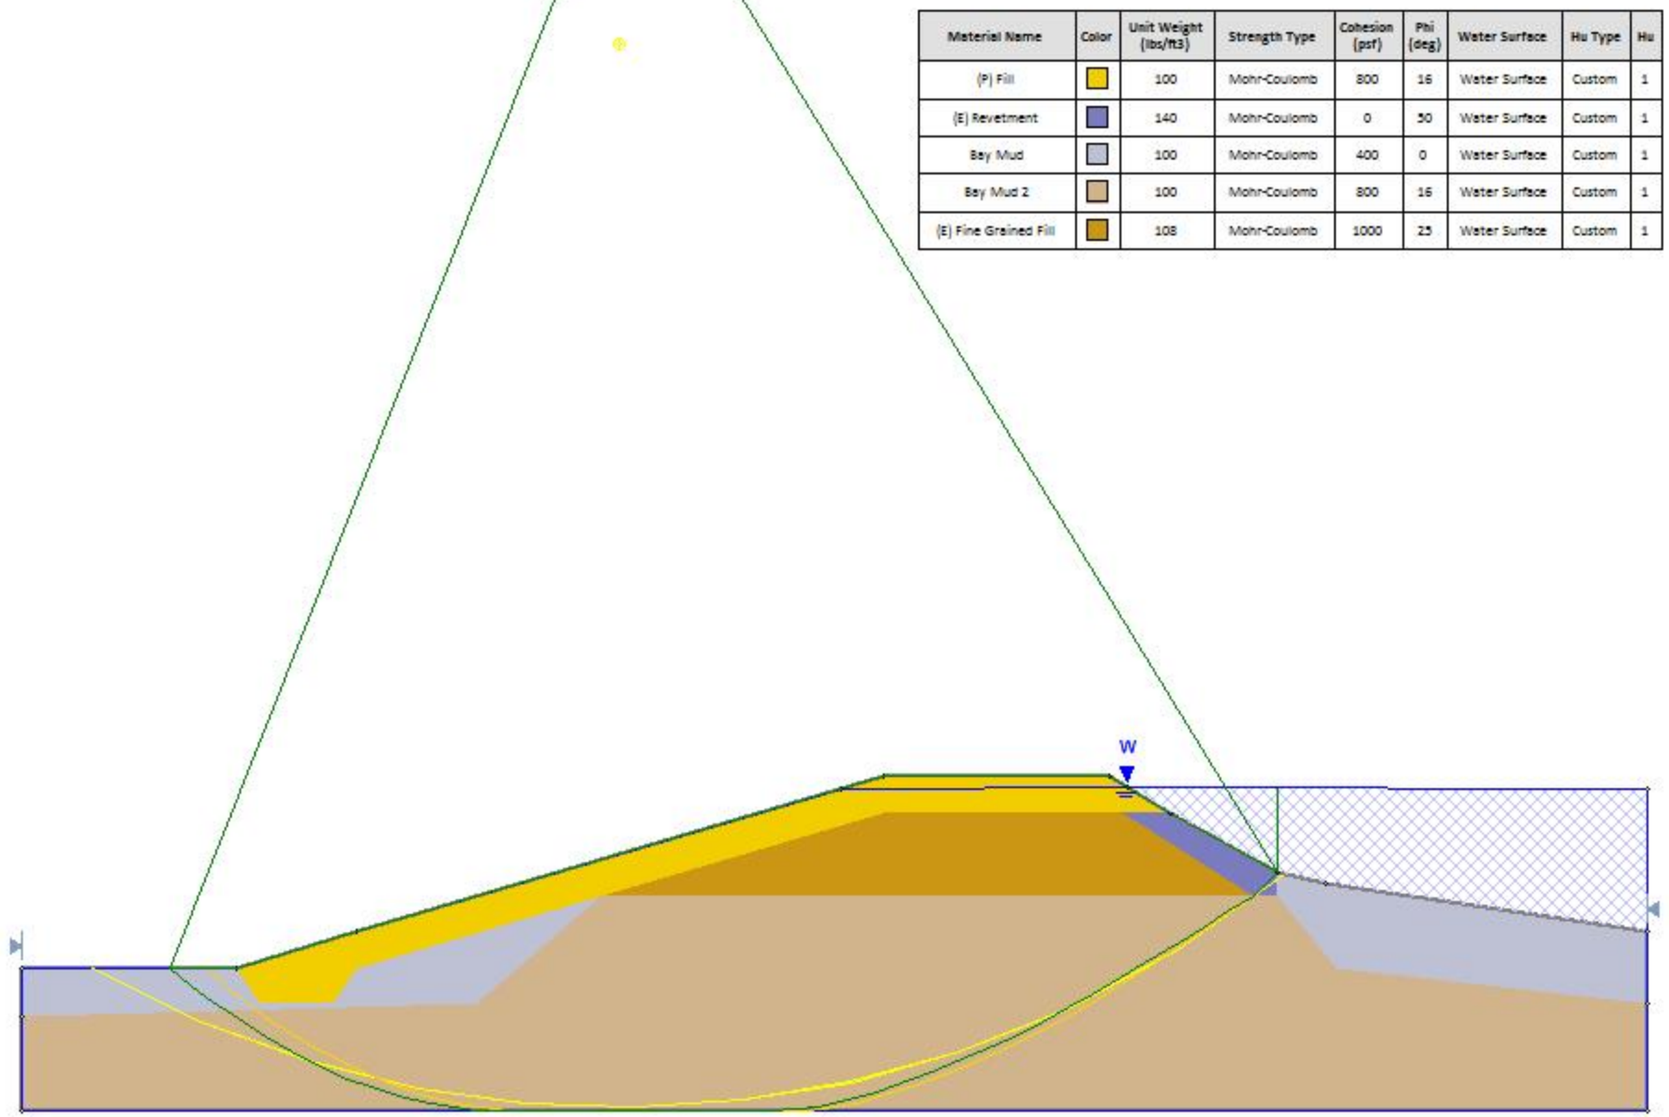
## Slope Stability Analysis

# SECTION 16+00, EMPTY POND - SEA LEVEL RISE - KING TIDE

1.491 Critical Failure Surface Factor of Safety

0.28 Pseudo Static Seismic Coefficent

| Material Name | Color | Unit Weight (lbs/ft3) | Strength Type | Cohesion (psf) | Phi (deg) | Water Surface | Hu Type | Hu |
|---|---|---|---|---|---|---|---|---|
| (P) Fill | | 100 | Mohr-Coulomb | 800 | 16 | Water Surface | Custom | 1 |
| (E) Revetment | | 140 | Mohr-Coulomb | 0 | 50 | Water Surface | Custom | 1 |
| Bay Mud | | 100 | Mohr-Coulomb | 400 | 0 | Water Surface | Custom | 1 |
| Bay Mud 2 | | 100 | Mohr-Coulomb | 800 | 16 | Water Surface | Custom | 1 |
| (E) Fine Grained Fill | | 108 | Mohr-Coulomb | 1000 | 25 | Water Surface | Custom | 1 |

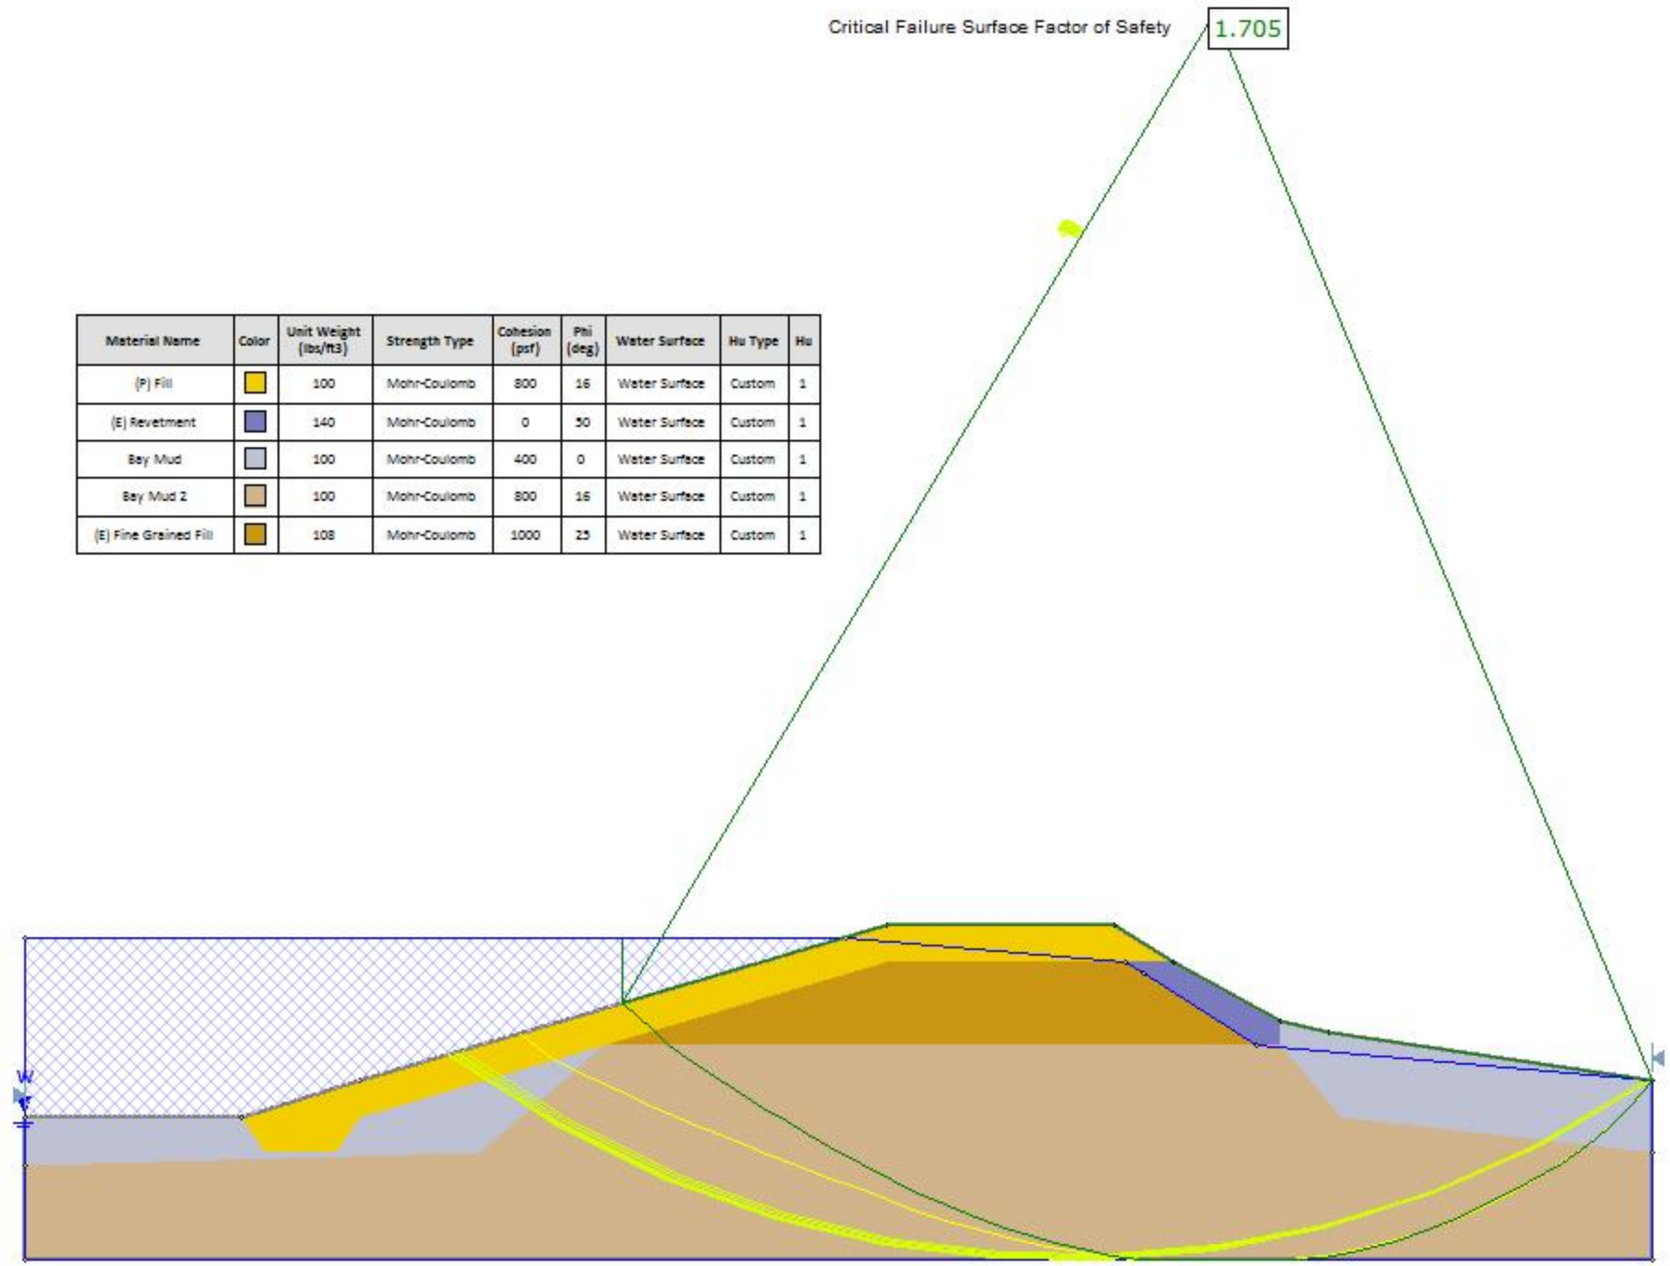


# SECTION 16+00, FULL POND - LOW TIDE

Pseudo Static Seismic Coefficent 0.28

Critical Failure Surface Factor of Safety 1.705

| Material Name | Color | Unit Weight (lbs/ft3) | Strength Type | Cohesion (psf) | Phi (deg) | Water Surface | Hu Type | Hu |
|---|---|---|---|---|---|---|---|---|
| (P) Fill | | 100 | Mohr-Coulomb | 800 | 16 | Water Surface | Custom | 1 |
| (E) Revetment | | 140 | Mohr-Coulomb | 0 | 50 | Water Surface | Custom | 1 |
| Bay Mud | | 100 | Mohr-Coulomb | 400 | 0 | Water Surface | Custom | 1 |
| Bay Mud 2 | | 100 | Mohr-Coulomb | 800 | 16 | Water Surface | Custom | 1 |
| (E) Fine Grained Fill | | 108 | Mohr-Coulomb | 1000 | 25 | Water Surface | Custom | 1 |



Pseudo Static Seismic Coefficent 0.28

# SECTION 31+00, EMPTY POND - SEA LEVEL RISE - KING TIDE

Critical Failure Surface Factor of Safety 1.346

| Material Name | Color | Unit Weight (lbs/ft3) | Strength Type | Cohesion (psf) | Phi (deg) | Water Surface | Hu Type | Hu |
|---|---|---|---|---|---|---|---|---|
| (P) Fill | | 100 | Mohr-Coulomb | 800 | 16 | Water Surface | Custom | 1 |
| Revetment | | 140 | Mohr-Coulomb | 0 | 50 | Water Surface | Custom | 1 |

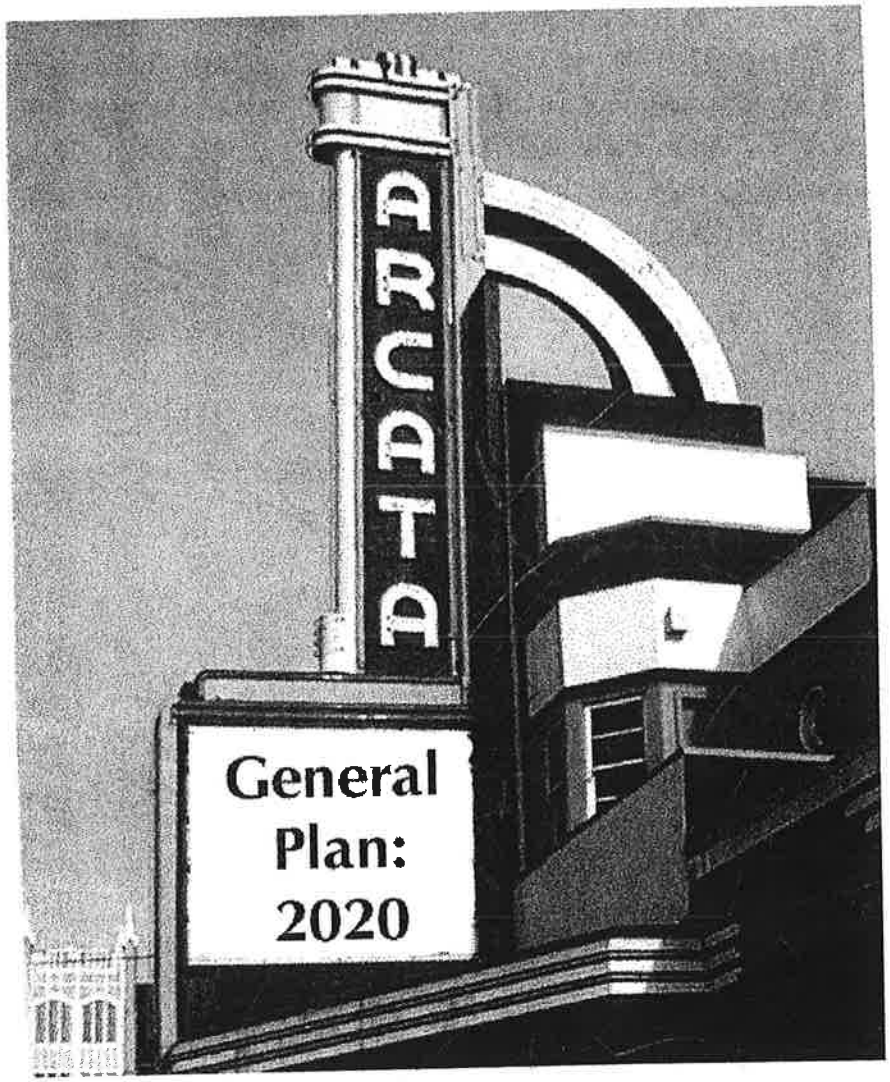
City of Arcata. 2000. *Excerpts from Air Quality Element of the Arcata General Plan.*

# Arcata General Plan: 2020 and Local Coastal Land Use Plan



**October, 2000**
**Amended October, 2008**
**(Ordinance No. 1377, September 3, 2008)**

AQ-2e **Recognize that poor air quality is caused by the combination of high pollutant emissions and meteorological conditions which do not allow for dispersal of pollutants.** The City shall coordinate a joint effort with the NCUAQMD to minimize the impact of high pollutant incidents and notify the public about meteorological conditions that contribute to poor air quality. The joint effort shall include employing the following measures:

1. Implement added air pollution control measures during predictable meteorological events of stagnant air. Inform the public of high pollutant incidents and encourage measures which minimize impacts, such as limiting use of wood-burning fireplaces, gas powered equipment, and avoiding non-essential vehicle travel.
2. Promote and encourage employer-based Transportation Demand Measures (such as subsidized bus fare, flexible work hours, and incentives to carpool) to reduce automobile travel, particularly during periods of poor air quality.
3. Support and encourage local industrial and commercial efforts to reduce emissions and particulate pollution from industrial plants and trucks, particularly during periods of poor air quality.
4. Require traffic and construction site dust control measures at construction projects. Require measures which reduce emissions from construction activity and maximize efficiency of traffic flow during inversion conditions.

AQ-2f **Enforce air quality control measures and monitoring at construction sites.** Construction emissions shall be controlled because, although they are temporary in nature, they can often be the greatest air quality impact of a project. Require the following control measures for construction activities when necessary:

1. Water all active construction areas twice per day and use erosion control measures to prevent water runoff containing silt and debris from entering the storm drain system.
2. Cover trucks hauling soil, sand, and other loose material.
3. Pave, water, or apply non-toxic soil stabilizers on unpaved access roads and parking areas.
4. Sweep paved access roads and parking areas daily.
5. Sweep streets daily if visible material is carried onto adjacent public streets.

For larger construction sites (four acres or greater) require the following measures when necessary in addition to those above:

6. Hydroseed or apply non-toxic soil stabilizers to inactive construction areas.
7. Enclose, cover, water, or apply non-toxic soil binders to open materials stockpiles.
8. Limit traffic speeds to 15 mph on unpaved access roads.

9. Install erosion control measures to prevent silt runoff onto public roadways.
10. Replant vegetation in disturbed areas within 30 days after project completion.

For construction sites near sensitive receptors, require the following measures when necessary, in addition to those above:

11. Install wheel washers for exiting trucks, or wash all equipment leaving site.
12. Install wind breaks, or plant trees/vegetation at windward sides of construction areas, or avoid removing existing vegetation which acts as a windbreak.
13. Suspend excavation and grading activity when winds exceed 25 mph.
14. Limit area subject to excavation, grading, and other construction activities at any one time.

AQ-2g **Enforce air quality control measures and monitoring for agricultural operations.** Air emissions from agricultural operations, including field burning, airborne soils, and over-spray from herbicide applications, shall be controlled and monitored through air quality standards as well as adherence to the Land Use Code.

**POLICY AQ-3 REGIONAL AIR QUALITY STANDARDS, MONITORING AND EDUCATION**

**Objective.** Participate in regional efforts to improve and monitor air quality and meet air quality goals, coordinate transportation and land use development planning with the North Coast Unified Air Quality Management District, and educate the public.

AQ-3a **Air quality standards and monitoring.** Identify potential emission sources of airborne toxins from mobile and stationary sources. This may be in coordination with the California Air Resource Board and the NCUAQMD, as appropriate. Enforce rigid high standards to restrict fumes, smoke, dust, or other environmental pollutants from stationary sources of pollution.

AQ-3b **Develop and distribute material to educate the public on air quality issues**. Work with Humboldt State University, the California Air Resources Board, and the NCUAQMD to develop educational material regarding air quality, impact of air quality on people, plants and animals, and what citizens can do to improve air quality. The City will make this information available.

AQ-3c **Cooperation in enforcement activities and programs**. Cooperate with the NCUAQMD in implementing and enforcing the district's rules and programs. Consider joint implementation of programs between the City and the district such as:

# PROGRAM YEAR

# 2020-2021

# MEMORANDUM OF COVERAGE

# PROPERTY

**REDWOOD EMPIRE MUNICIPAL INSURANCE FUND**
**MEMORANDUM OF COVERAGE**
**PROPERTY PROGRAM (SHORT FORM)**

## PROPERTY COVERAGE

Property coverage is provided when a city/town has property damage due to all perils except earthquake or those exclusions listed in the excess coverage/policy. The property must be owned by the member agency or the member agency must have a lease-holder interest in the property and have that lease holder interest declared with the insurance company.

## DEDUCTIBLES SELECTED AND COVERAGE AMOUNTS

| | | | |
|---|---|---|---|
| REMIF | 0 | Lakeport | $100,000 |
| Arcata | $100,000 | Rohnert Park | $100,000 |
| Cloverdale | $100,000 | Sebastopol | $100,000 |
| Cotati | $100,000 | Sonoma | $100,000 |
| Eureka | $100,000 | St. Helena | $100,000 |
| Fort Bragg | $100,000 | Ukiah | $100,000 |
| Fortuna | $100,000 | Willits | $100,000 |
| Healdsburg | $100,000 | Windsor | $100,000 |

Deductibles for all property loss are outlined above. Deductibles for wildfire are $500,000 and $100,000 for flood loss in high flood zones.

REMIF SELF-INSURED FUND - Difference between entity selected deductible and excess coverage deductible.

EXCESS INSURANCE - Replacement value in excess of excess coverage deductible unless settlement is resolved by agreed upon stated values.

NEW PROJECT/PURCHASE NOTIFICATION

Any construction project, purchase of building or equipment exceeding $1,000,000 must be reported to REMIF within thirty (30) days of the signing of the construction agreement or assumption of control of the new property or equipment.

## CENTRAL POOL PROPERTY COVERAGE PROGRAM

COVERAGE AGREEMENT

Effective July 1 of each year unless otherwise indicated, coverage is provided against all risk of physical loss except those exclusions to the coverage that are stated in this agreement or in the excess policy that is in place at the time of the loss. The loss can occur to covered entity owned, leased, or rented real and personal property that is under the care, custody and control of the covered entity and may include such additional expenses as loss of revenue or rent, as long as

these expenses are incurred as a result of the covered direct physical loss. In the case of rented or leased property, the entity must submit to REMIF a request naming the property owner as a Loss Payee, as required by the leasing or renting contract, prior to any loss, before coverage can be extended to the property owner. Coverage is provided on a replacement cost basis as defined by the excess policy in effect at the time of the loss. In unusual circumstances, coverage may be on a stated value basis.

Generally, replacement cost means that reimbursement will be made by replacing the lost property or equipment with equivalent property or equipment or if replacement is not desired, payment of an amount agreed upon, based on the stated value of the property or equipment.

All reasonable costs incurred to adjust and resolve the covered loss shall be included in any settlement. This cost may include, but it is not necessarily limited to, outside adjusting company fees and expenses.

Except as otherwise indicated, terms and conditions appearing in the excess property insurance policy in effect at the time of the occurrence will apply to this coverage.

The protection afforded by the Authority is self insurance, and under no circumstances shall be construed as any form of insurance.

EXCLUSIONS

The specific exclusions are contained in the excess property policy in effect at the time of the loss/occurrence.

C. MEMBERS COVERED

Coverage shall apply to those entities identified above under "Deductibles Selected and Coverage Amounts.

D. LIMITS

The Authority shall pay all covered losses up to excess deductible amounts per occurrence that are in excess of each participating entity's deductible or retention. Losses in excess of the deductible will be paid by the excess insurance policy up to the replacement value on all covered property, except where specific limits are stated in the excess policy in effect at the time of the occurrence. The total that will be paid on any occurrence is the limit of the excess coverage. Above the excess coverage, the entity is responsible for payment of those losses. Business interruption and extra expense coverage is part of the policy. Coverage for employee's personal property is included if the entity has a policy statement that allows it to pay for the employee's personal losses.

E. COURSE OF CONSTRUCTION

If a building project requires the entity to provide course of construction insurance, the Authority must be notified of such prior to the beginning of the contract so the proper endorsement can be

obtained to ensure that coverage is in place. It is recommended that the contractor be required to provide the course of construction coverage to protect the member.

F. POLICY

A copy of the excess general property insurance policy is kept at the REMIF office. One will be furnished any participating entity upon written request.

## LOSS AND CLAIMS REPORTING

PROPERTY LOSSES

Property losses which exceed the entity's deductible will require loss adjusting services to be provided by REMIF or by the excess carrier's designated adjustment company. If the loss does not exceed REMIF's retention level, REMIF will choose the adjuster and/or law firm in the matter. If the lawsuit exceeds REMIF's retention level, the excess carrier must be notified immediately and has the right to assign an adjusting firm and/or law firm of their choice. All property losses in excess of the member entity's deductible should be reported immediately. If the loss is a significant one (i.e., property loss in excess of $25,000) REMIF and the third party liability claims administrator should be notified immediately. It is imperative that specific details of the loss, including lists and values of contents or description of equipment and/or building loss, be sent to the General Manager within seven (7) working days of the loss. In order to protect any coverage offered by the excess insurance carrier, the risk manager must report these losses to the broker and carrier immediately. If the loss occurs during off hours or on weekends, and exceeds the $25,000 threshold, the third party liability claims administrator should be immediately contacted. This should be followed with a telephone call or an e-mail to the REMIF office with a message being left for the General Manager or with staff that might be at the office.

As a reminder, it is imperative that major losses be reported as soon as possible so that coverage by REMIF's excess carrier will not be jeopardized and the adjusting of the loss can begin immediately to help expedite a return to normal at the loss site.

VALUE REPORTING

Each entity should designate a staff person who can work with the REMIF staff in keeping REMIF notified of property value changes, additions, and deletions. REMIF needs to be notified within ten (10) days of any acquisition or disposal of any properties and/or equipment that are in excess of $1,000,000. In turn, REMIF must report within a thirty (30) day period of time to the excess carrier those changes in excess of $1,000,000. All other changes should be reported, to REMIF, within thirty (30) days if they exceed $100,000.

The property coverage obtained by REMIF is based on a stated replacement value. Therefore, to assure proper coverage and reimbursement in case of a loss, current property valuation is important to the success of the property coverage program for the following reasons:

- to assess loss potentials and achieve limits of coverage adequate for the largest possible loss;
- to use as a factor of the property coverage rate to calculate each participating entity's contribution for the property coverage;
- to use as a basis by the excess carrier for a loss adjustment;
- to avoid disputes with the excess carrier due to undervalue reporting.

For the reasons stated above, it is important that the values be reported to the Authority staff and that this be done on a consistent yearly basis so that there is consistency among all participating entities.

Once a year, REMIF will submit to the entity's designee, a property list. This list should be reviewed and revised to reflect new properties, equipment and accurate values for current properties and equipment, in order to be sure that adequate coverage will be available in case of a loss. The list should also be reduced to reflect property that no longer belongs to the city or that the city does not want to insure. Rental and leased properties and equipment should also be on the property list, whether they are leased, rented by the entity or owned by the entity and leased/rented to a third party. The value of the property/equipment that is rented or leased by the entity will only be covered if the contractor requires the entity to provide property coverage.

[Incorporated herein by reference, excess property coverage policy]

| **TYPE OF INSURANCE:** | ☒ Insurance ☐ Reinsurance |
| **NAMED INSURED:** | California Joint Powers Risk Management Authority |
| **DECLARATION:** | 35-JPA/Pools 2 |
| **POLICY PERIOD:** | July 1, 2020 to July 1, 2021 |
| **REFERENCE NUMBER:** | APIP2020 (Dec 35) |
| **COMPANIES:** | See Attached List of Companies |
| **TOTAL INSURED VALUES:** | $ 10,397,558,483 as of June 28, 2020 |

**COVERAGES & LIMITS:**

| | | |
|---|---|---|
| $ 375,000,000 | Excess of 25,000,000 Primary Policy. Below Sub-Limits are Inclusive of Primary Per Occurrence: all Perils, Coverages (subject to policy exclusions) and all Named Insureds (as defined in the policy) combined, per Declaration, regardless of the number of Named Insureds, coverages, extensions of coverage, or perils insured, subject to the following per occurrence and/or aggregate sub-limits as noted below. |
| $ 75,000,000 | per occurrence and Annual Aggregate excess of 25,000,000 Primary Flood Placement and underlying deductibles Flood Limit - Per Occurrence and in the Annual Aggregate (for those Named Insured(s) that purchase this optional dedicated coverage). |
| $ 25,000,000 | per occurrence and Annual Aggregate Excess of Primary A&V Placement and underlying deductibles Per Occurrence and in the Annual Aggregate for scheduled locations in Flood Zones A & V (inclusive of all 100 year exposures). This Sub-limit does not increase the specific flood limit of liability for those Named Insured(s) that purchase this optional dedicated coverage. |
| Not Applicable | Per Occurrence for losses to locations in Tier 1 and/or Tier 2 Counties and resulting from a Named Windstorm. |
| Not Covered | Earthquake Shock - Per Occurrence and in the Annual Aggregate (for those Named Insured(s) that purchase this optional dedicated coverage). |
| $ 100,000,000 | Combined Business Interruption, Rental Income and Tuition Income (and related fees). However, if specific values for such coverage have not been reported as part of the Named Insured's schedule of values held on file with Alliant Insurance Services, Inc., this sub-limit amount is limited to $500,000 per Named Insured subject to maximum of $2,500,000 Per Occurrence, Per Declaration for Business Interruption, Rental Income and Tuition Income combined. Coverage for power generating plants is excluded, unless otherwise specified. |
| $ 50,000,000 | Extra Expense. |

| | | | |
|---|---|---|---|
| **COVERAGES & LIMITS: (continued)** | $ | 25,000,000 | Miscellaneous Unnamed Locations for existing Named Insured's excluding Earthquake coverage for Alaska and California locations. If Flood coverage is purchased for scheduled locations, this extension will extend to include Flood coverage for any location not situated in Flood Zones A or V. |
| | | 180 days | Extended Period of Indemnity |
| | | See Policy Provisions | $25,000,000 Automatic Acquisition up to $100,000,000 or a Named Insured's Policy Limit of Liability if less than $100,000,000 for 120 days excluding licensed vehicles for which a sub-limit of $10,000,000 applies per policy Automatic Acquisition and Reporting Condition. Additionally, automatic coverage is granted for up to 60 days, subject to a sub-limit of $2,500,000 for additional property and/or interests in Tier 1 Wind Counties, Parishes and Independent Cities for the states of Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Louisiana, Texas and/or situated anywhere within the states of Florida and Hawaii. The peril of EQ is excluded for the states of Alaska and California. If Flood coverage is purchased for all scheduled locations, this extension will extend to include Flood coverage for any location not situated in Flood Zones A or V. |
| | $ | 1,000,000 | Unscheduled Landscaping, tees, sand traps, greens, athletic fields and artificial turf and further subject to $25,000 / 25 gallon maximum per item for existing Named Insureds excluding Earthquake coverage for Alaska and California locations. If Flood coverage is purchased for scheduled locations, this extension includes Flood coverage for any location not situated in Flood Zones A or V. |
| | $ | 5,000,000 | or 110% of the scheduled values, whichever is greater, for Scheduled Landscaping, tees, sand traps, greens, athletic fields and artificial turf and further subject to $25,000 / 25 gallon maximum per item. |
| | $ | 50,000,000 | Errors & Omissions - This extension does not increase any more specific limit stated elsewhere in this policy or Declarations. |
| | $ | 25,000,000 | Course of Construction and Additions (including new) for projects with completed values not exceeding the sub-limit shown. |
| | $ | 2,500,000 | Money & Securities for named perils only as referenced within the policy. |
| | $ | 2,500,000 | Unscheduled Fine Arts. |
| | $ | 250,000 | Accidental Contamination per occurrence and annual aggregate per Named Insured with $500,000 annual aggregate for all Named Insureds per Declaration. |

**Subject: Report of Findings for City of Arcata Corporation Yard Phase II Over Excavation and Stockpiling of contaminated soils and proposed groundwater monitoring well installation.**

## Introduction:

This report was prepared by the City of Arcata Public Works Department (APW) to document the additional approved overexcavation of contaminated soils and recommended installation of groundwater monitoring wells to assess potential groundwater impacts.

## Brief History

Between October 25th and October 30th, 2000, it is estimated that approximately 550 gallons of gasoline were released into the temporarily constructed wooden platform beneath a diesel and gasoline pump dispenser.

Based on the visual investigation of surface contamination, the gasoline spread-out through a portion of the Corporation Yard and migrated offsite via an 8-inch diameter pipe underneath a trail/walkway and entered a minor drainage course (vegetated swale), which ultimately drains to a slough channel and into Humboldt Bay. There was additional assumed migration to the south towards and beneath the old concrete dispenser island which had historical piping leakage and/or dripping in the area.

Surface water and soil sampling performed on November 1, 2000, indicated surface contamination extended approximately 125 feet down gradient/slope from the source of the release to the north. Soil and surface water samples were collected near the source and down gradient.

Excavation and stockpiling of contaminated soils and groundwater/product recovery began on November 1, 2000 and was completed on November 6, 2000. Approximately 250 cubic yards of material was winterized onsite. Refer to report dated December 2000 Report of Findings for Additional Investigation City of Arcata Corporation Yard prepared by the City. All previous analytical sampling results from the site are located in Attachment 2.

## Field Work Oct 2001

Groundwater grab samples were collected using disposable bailers from the three previously excavated pit areas to assess relative contamination concentrations. Refer to Table 1 for results.

Sample Pit 3 exhibited the highest concentrations at 870 part per billion (ppb) total petroleum hydrocarbons as gasoline (TPH-g) and 140 ppb TPH as diesel (TPH-d) and MTBE at 9800 ppb which was located below the initial release area. Samples 1 and 2 exhibited minor contamination.

Approximately 500 cubic yards of soil was excavated and winterized between October 4 and October 9, 2001 in accordance with the approved work plan. The existing 250 cubic yard soil piles were moved adjacent to the new piles. The old concrete pump island was removed. 14 confirmation soil samples were submitted for analysis of TPH-d, TPH-g ,BTEX and MTBE following the work (See results in Table 1). Approximately 800 gallons of water was pumped from the excavation during the work and is stored onsite pending analytical results for TPH-d, TPH-g, BTXE and MTBE. It is anticipated this groundwater will be removed by Chico drain oil in February 2002 once analysis is complete.

The site was backfilled with no. 3 drain rock about 1.0' around the 6" diam. perforated pvc pipe manifold laid in the excavation bottom (see Figure 2 for pipe location). The excavation was then backfilled with pea gravel to approximately 1.0' below existing grade. Pea gravel was covered with plastic and filter fabric (see Figure 3) and brought to grade with crushed base rock. 6" diam. cleanouts were brought to grade from the groundwater recovery pipe. All soils are currently winterized onsite in four piles totaling approx. (750 cubic yards).

## Results of Investigations

The excavation extended approximately 5-6 feet in depth throughout the area. The soils encountered were typically silty fill with pockets of gravel, rock, concrete and asphalt chunks. Some woody debris and stumps were removed from the south wall near sample 54 and woody debris remains in the ground at this location.
Residual Gasoline (TPH-g) and Diesel (TPH-d) contamination remains in the sidewalls samples at < 25 ppm gasoline and <200 ppm diesel in the majority of the sidewall samples and all bottom samples. Exceptions are noted near the existing traffic storage area/concrete containment structure sample 60 with TPH-g at 790 ppm and TPH-d at 2800 ppm and sample 54 with TPH-g at 150 ppm and TPH-d at 2400 ppm to the south (See Table 1).

The groundwater recovered from the excavation principally came from waters encased around the woody debris found on the southerly wall near sample 54.

## Recommendations

### Overexcavation

It is recommended additional overexcavation of approximately 100 cubic yards total near samples 54/ WP-4 to remove the buried woody debris/soil and also near sample 60 in the shallow sandy/gravelly soils which contained obvious gas/diesel contamination. This work could occur in April/May once groundwater has lowered or is removed. Confirmation sidewall and bottom samples will be collected in accordance with the previously approved overexcavation plan.

### Installation of Groundwater Monitoring Wells

We recommend installing five groundwater monitoring well installation where shown on Figure 2. This phase of the hydrogeologic investigation will consist of the installation of five (5) monitoring wells for monitoring groundwater contamination levels as well as seasonal groundwater elevations and groundwater gradient direction. Soil samples will also be collected from the well borings and tested for hydrocarbon contaminants if present.

The locations of the proposed monitoring wells have chosen based on observed contamination and assumed/observed groundwater gradient direction. The proposed well placement will allow for determination of localized groundwater gradient and direction. Wells 1, 2, and 3 are in the assumed downgradient direction and wells 4 and 5 will provide assessment of potential offsite impacts.

Prior to installation of the wells, the City of Arcata will obtain a monitoring well construction permit from the HCDEH.

### Monitoring Well Construction

Five monitoring wells will be installed using a truck-mounted drill-rig equipped with an 8 1/4 inch outside diameter hollow-stem augers. Approximately 3-5 feet of perforated well screen will be installed from just above the highest seasonal groundwater level to the bottom of the wellborn. All wells will be completed in the shallow water- bearing zone. Maximum well depth is not anticipated to exceed 8 feet bgs. The monitoring wells will be constructed of clean, flush-threaded, two-inch diameter PVC well materials. Well screen, with O.O2-inch perforations, will extend from the bottom of each boring to approximately 3 feet bgs, and blank casing will be extended to ground surface. A filter pack of Lonestar #3 or #2/12 sand will extend from the bottom of each boring to one foot above the screened interval. The filter pack will be sealed by a one-foot layer of hydrated bentonite. The remaining annular space will be filled with cement bentonite grout and surface construction of the wells will consist of a locking, flush mount, traffic, and waterproof cover. Proposed monitoring well construction details are shown in Figure 4. We will not advance borings through the aquitard or aquiclude immediately below the first water bearing zone.

Augers and samplers will be decontaminated between use by either steam cleaning or an Alconox@ wash followed by a double rinse in clean tap water to prevent cross-

contamination. Soil cuttings and auger/sampler rinsate will be stored on-site in labeled 55-gallons drums pending future removal and disposal.

## Well Development, Groundwater Sampling and Testing

Approximately 12 to 72 hours after installation, the static water level will be recorded and the wells will be developed using a bailer and/or 1.7-inch hand pump. The ph, conductivity, and temperature of the water will be tested at regular intervals to verify that representative samples of formation groundwater are present in the wells. The wells will be allowed to recharge and stabilize for 12 to 24 hours. The water levels will be re-measured after recovery. Three well volumes will be purged from the wells, again testing pH, conductivity, temperature, and clarity for signs representative formation waters, and then groundwater samples will be collected. Should the well(s) be contaminated with free product, the thickness of the product will be measured using water sensitive paste (both before and after purging). Groundwater samples will be taken from the wells with disposable PVC bailers, stored in appropriate containers (i.e. VOA vials), placed under field refrigeration, and transported to a State certified laboratory under appropriate chain of custody documentation for analyses. Groundwater samples will be tested for TPH-d TPH-g, BTXE and MTBE.

We will determine the elevation and location of each well to an accuracy of 0.01 feet, with respect to a mean sea level datum point.

## Groundwater Direction and Gradient

Groundwater flow direction and hydraulic gradient will be determined for each set of water level data by resolving a three point problem for the orientation of a hypothetical planar surface in space. Results of the three-point problem will be used to generate a groundwater contour map, depicting the groundwater elevations projected across the site and the local flow direction

## Groundwater Monitoring Program

We believe that it will be necessary to conduct monitoring for a minimum of one year in order to fully assess the impact of released product on the groundwater flow direction, and the hydraulic gradient. Quarterly sampling of the monitoring wells, for laboratory analyses, will be collected for one year. Monthly water levels will be determined and a tidal influence study will be performed. We recommend that water levels only be measured at each quarterly sampling event should the hydraulic data indicate that this would be acceptable. Sampling procedures are outlined in the previous section. Four quarterly reports will be generated during the course of a one-year monitoring period. The reports will include monthly water level measurements, calculated hydraulic gradient, groundwater flow direction(s), a summary of observations, and quarterly laboratory analyses.

## QA/QC

Groundwater sample quality control and assurance measures will include a trip blank consisting of a sample container filled at the laboratory with distilled (blank) water.

**Site Sanitation Procedures**

All drill cutting and groundwater extracted from wells and boreholes will be stored on site in D.O. T. 55-gallon drums. Laboratory analyses will be utilized to establish proper disposal procedures for cuttings and purge/development waters. Rinsate generated from steam cleaning drilling, development, and sampling equipment will be contained in a portable washbasin and pumped into 55-gallon drums for storage prior to disposal.

**Groundwater Pumping/Treatment**

The groundwater in the excavation area from pit 3 will be pumped this winter into the above ground 3200 gallon P.E. tank. A water sample will be collected and analyzed for TPH-d TPH-g, BTXE and MTBE. Based on the analytical results and the initial groundwater monitoring well analytical results groundwater treatment options will be determined and a groundwater remediation plan will be submitted to the RWQCB for approval.

**Winterized Soil Pile Remediation**

Soil piles will continue to be winterized onsite and proposed additional material (100 CY) will be added to the existing area. It is anticipated that soil biopiles or other intrinsic processes will be used to treat soil contaminants onsite. The soil piles will be uncovered during the dry weather (summer 2002) and mixed/blended to allow homogenization of the piles.
Random soil samples will be collected (1 per 100 CY) and analyzed for TPH-d TPH-g, BTXE and MTBE. Based upon the results a remediation alternative will be submitted to the RWQCB for approval.

We look forward to your response and approval of this plan for installation of groundwater monitoring wells and additional overexcavation of contaminated soils. Please do not hesitate to contact me at 707.825.2173 if you have any questions.

Sincerely,

R. Charles (Doby) Class
Deputy Public Works Director

CC: Melissa Martel, HCDEH
Jim Baskin, California Coastal Commission
Jill Geist, City of Arcata

ND = Not Detected at the Reporting Limit

Limit = Reporting Limit

All solid results are expressed on a wet-weight basis unless otherwise noted.

**REPORT CERTIFIED BY**

Laboratory Supervisor(s)

QA Officer

Jesse G. Chaney, Jr.
Laboratory Director

TPH Diesel:
The LCS/LCSD recoveries were below the lower acceptance limits for diesel. The surrogate recoveries for the method blank and the LCS/LCSD were below the lower acceptance limit. These recoveries indicate that the sample results may be erroneously low. However, all of the sample surrogate recoveries were within acceptance limits indicating that only the quality control samples were effected.

Samples 54, 60 and 64 contain material similar to degraded or weathered diesel oil.

Samples 55, 61, 62 and 63 contain material in the diesel range of molecular weights, but the material does not exhibit the peak pattern typical of diesel oil.

Samples 51, 52, 55 and 57 contain material in the diesel range of molecular weights and beyond. This suggests the presence of an oil heavier than diesel.

Samples 56, 58 and 59 contain material in the diesel range of molecular weights and beyond. The samples also exhibit the peaks typical of diesel. This indicates the presence of diesel plus an oil heavier than diesel.

The surrogate for samples 54 and 60 could not be quantified due to sample dilutions.

Samples 61, 62, 63 and 64 contain material beyond the diesel range. This suggests the presence of an oil heavier than diesel. The amount of this material is not included in the results reported.

The surrogate for samples 52 and 53 were not quantifiable due to the sample matrix.

TPH-Gasoline:
The samples listed below do not present a peak pattern consistent with that of gasoline. However, the results reported represent the amount of mateiral in the gasoline range.
53 54 55 56 58 59 60 63

BTXE:
Some reporting limits were raised for the samples listed below due to matrix interference.
53 54 55 56 58 61 63 64

Sample 60 was diluted and the reporting limits were raised additionally due to matrix interference.

Suggest confirmation of the positive MTBE results by GCMS for the samples listed below.
53 54 55 56 57 61 63

## CASE NARRATIVE

TPH-Diesel:
Pit 1 and Pit 2 contain material in the diesel range of molecular weights and beyond. This suggests the presence of an oil heavier than diesel.

Pit 3 contains material in the diesel range of molecular weights, but the material does not exhibit the peak pattern typical of diesel oil.

All diesel results reported represent the amount of material in the diesel range of molecular weights only.

TPH-Gasoline:
Pit 3 does not present a peak pattern consistent with that of gasoline. However, the result reported represents the amount of material in the gasoline range.

BTXE:
Some reporting limits were raised for Pit 3 due to matrix interference.

Suggest confirmation of the positive MTBE results for Pit 2 and Pit 3 by GCMS.

TPHD--Total petroleum hydrocarbons as diesel
TPHG--TPH as gasoline
B--Benzene
T--Toluene
E--Ethylbenzene
m, p, o, X--meta, para, ortho Xylene

Fuel Oxygenates include Tertiary Butyl Alcohol (TBA), Methyl Tert Butyl Ether, (MTBE), Di-isopropyl Ether (DIPE), Ethyl Tert Butyl Ether (ETBE), and Tertiary Amyl Methyl Ether(TAME).

1. MTBE was detected at 0.190 mg/kg.
2. MTBE was detected at 0.033 mg/kg.
3. Diesel concentration includes some portion of heavier end organics that extend past the diesel range.
4. Reporting limits were increased due to sample foaming.
5. Reporting limits were increased due to high concentrations of target analysis.

TPHD--Total petroleum hydrocarbons as diesel
TPHG--TPH as gasoline
B--Benzene
T--Toluene
E--Ethylbenzene
m, p, o, X--meta, para, ortho Xylene
Fuel Oxygenates include Tertiary Butyl Alcohol (TBA), Methyl Tert Butyl Ether (MTBE), Di-isopropyl Ether (DIPE), Ethyl Tert Butyl Ether (ETBE), and Tertiary Amyl Methyl Ether (TAME).

1. MTBE was detected at 150 ug/l, and TAME was detected at 5.3 ug/l.
2. MTBE was detected at 15,000 ug/l and TAME was detected at 290 ug/l.
3. MTBE was detected at 74 ug/l.
4. MTBE, TBA and TAME were detected at 4,200 ug/l, 590 ug/l, and 54 ug/l, respectively.
5. Contains material similar to degraded or weathered diesel oil.
6. Samples contain material in the diesel range of molecular weights, but the material does not exhibit the peak pattern typical of diesel oil.
7. Sample contains material in the diesel range of molecular weights and beyond. This suggests the presence of an oil heavier than diesel.
8. Reporting limits were increased due to sample foaming.
9. Reporting limits were increased due to high concentrations of target analysis.

| E = Ethylbenzene | |
| X = Total Xylenes | |

Nine soil borings WP 101 – WP 109 were installed by direct push using a truck-mounted geo-probe. The soil borings were located on site in the general vicinity to the south and west of the source area. The soil boring locations are shown on Figure 2.

The soil samples were collected using continuous coring. A 1-3/4 inch diameter sample tube was driven into undisturbed soil at approximately 4-foot intervals. Following the sample retrieval, a portion of the sample was selected from each tube and tube ends were sealed using Teflon tape and plastic end caps. The samples were labeled regarding location depth, date and time analysis and initials. The soil samples were delivered to a California certified analytical laboratory under chain of custody. The analysis of soil samples included TPHG, TPHD, BTEX, and fuel oxygenates.

The soil borings were converted to temporary groundwater well points. The well points were used as a preliminary presence/absence and determine extent of contamination in the groundwater at the site. The locations are shown on Figure 2.

Well points were installed using 1-inch diameter slotted PVC with screens placed approximately 4 feet below the water table. The well points were measured for depth to water, and sampled using disposable tubing bailers. Groundwater samples were collected in accordance with laboratory protocol and transported under chain of custody to a certified analytical laboratory. Groundwater samples were analyzed for TPHG, TPHD, BTEX and fuel oxygenates. The soil boring/temporary well points were backfilled with betonite holeplug and brought to existing surface. The soil generated during the investigation is placed on-site in 5-gallon plastic buckets. Drilling tools were decontaminated and the well point purge water was disposed of through the Arcata Wastewater Treatment Plant.

## Laboratory Analysis

Soil samples submitted during the investigation were analyzed for TPHG, BTEX, MTBE and fuel oxygenates by utilizing EPA method number 8260B and TPHD EPA method 3550/gcfid.

The groundwater samples collected from the temporary well points were analyzed for TPHG, BTEX, MTBE and fuel oxygenates by utilizing EPA method number 8260B and for TPHD using EPA method 3510.

## Investigation Results

### Lithology

Underlying soils in the borings consist of silty gravel fill extending to approximately 2-feet below ground surface. 2-foot to 3-foot olive to orange/brown silty sand layers with some gravel. From approximately 3 to 8 feet below ground surface, soils were dark gray clayed silts with some gravel. Bay muds were encountered at approximately 8-feet below ground surface. Dark gray/brown bay muds (see attached boring logs included as attachment 2 by SHN Engineering Consultants).

Soil Analytical Results

Results of soil investigation demonstrated no significant TPHG, MTBE or fuel oxygenate contamination is present in the soils from borings WP 101 through WP 109. The soil sample from WP103 had total zylene concentrations of 0.018 mg/Kg.

Diesel and material with a similar molecular weight and heavier than diesel (possibly diesel oil) represents the majority of contamination at the site. Diesel contamination was detected in soil samples collected from WP 101, WP103, WP104, WP106 and WP108 at concentrations ranging from 12 to 810 mg/Kg. The analytical results for soil contamination are presented in Table 1 and the soil testing results are included as an attachment.

Groundwater Analytical Results

The results of the groundwater collected from the temporary well points indicates minor hydrocarbon contamination at WP103 located near the driveway in the Corporation Yard with detectible levels of TPHG and BTEX. TPHG was detected in WP103 at 120ug/L, ethyl benzene at 0.50ug/L and total xylenes at 3.6ug/L. MTBE and TPHD were detected in the groundwater sample collected at WP109. TPHD concentrations were 76 ug/L and MTBE at 0.76 ug/L. The fuel oxygenate Tert-Butanol was detected in groundwater sample collected from WP101 at a concentration of 5.9 ug/L. All other groundwater samples from the well points contain non-detectible constituents (refer to Table 2 for groundwater analytical results. Analytical reports are included as an Attachment.

## CONCLUSIONS

### Soil Contamination

Elevated concentrations of diesel, gasoline and BTEX were observed in the vicinity of the fuel island is demonstrated through the previous site investigations. The results from mw101 had the highest concentrations as TPHD at 810 mg/Kg.

### Groundwater Contamination

The greatest hydrocarbon concentrations in groundwater were observed in the vicinity of the fuel island well points WP101, WP103 and WP109 had detectible concentrations of TPHD, TPHG, BTEX and fuel oxygenates. These low levels are attributed to the sampling point and/or historical use of the Corporation Yard which has likely contributed low-level diesel throughout the site. Diesel concentrations from WP109 do not exhibit typical pattern of diesel indicating concentrations may have been due to presence of naturally occurring organic materials or other hydrocarbon materials of similar nature.

Fuel Leak Overexcavation November 2000

## INTRODUCTION

Between October 25th and October 30th, 2000, it is estimated that approximately 550 gallons of gasoline were released into the temporarily constructed wooden platform beneath a diesel and gasoline pump.

Based on the initial investigation of surface contamination, the gasoline spread through a portion of the Corporation Yard and exited via an 8-inch diameter pipe underneath a trail/walkway and entered a drainage course, which ultimately drains to Humboldt Bay.

Based upon further inspection and sampling performed on November 1, 2000, surface contamination extended approximately 125 feet down gradient from the source of the release. A hydrocarbon boom was placed down gradient in the drainage course and absorbent pads were used to remove as much visible gasoline stained water/soil as possible surrounding the spill area. It was decided that an over excavation of surface contaminated soils would be performed immediately.

Soils samples were collected in the vicinity of the initial release and down slope and a surface water sample was collected approximately 500 feet down gradient of the release, results are shown in Table 3.

The initial fuel release notification occurred on October 30th, at 9:15 a.m. reporting to the Humboldt County Division of Environmental Health. Supplemental information was submitted to the Humboldt County Division of Environmental Health on October 31st.

### Field Work

On November 1, 2000 excavation began in the area near Pit #1, at the outlet of the 8" pipe (see Figure 1). A containment site was constructed in an area which had previously been discussed with Chris Murray from the North Coast Regional Water Quality Control Board, on City property at the Corporation Yard. The containment cell was constructed of 4 – 6 inches of dirty sand underneath 10 mil. polyethylene plastic, 20 feet by 100 feet. On this day, approximately 40 yards of soil was over excavated from Pit #1 area. Obviously contaminated soils were over excavated. The limits of excavation were extended to soils which appeared to not have been impacted by the release.

November 2, 2000

The over excavation was continued approximately, 60 yards were over excavated on this day and placed onto a containment cell, and an additional containment cell, 20 by 100 feet was constructed next to the initial containment cell. Pit water from Pit #1 was evacuated using the City of Arcata Vactor truck and placed into the City's Corporation

Yard drainage system, which passes through an oil/water separator, and ultimately discharged to the oxidation ponds. This did not commence further after discussion with Vicki Frey of the Humboldt County Division of Environmental Health. We discussed that future purged water/product recovery would be placed in a suitable containment structure and/or 55 gallon drums.

November 3, 2000

Approximately 50 yards of soil was excavated on this day from Pit area #2 and Pit area #3. The soil was placed into the containment cells and approximately 50 gallons of water was bailed and placed into a 55 gallon drum.

November 4, 2000

An additional 50 yards of contaminated soil was excavated from the area in Pit #3. The excavation was extended to probable limits of gasoline impact resulting from the spill, based on surface staining and visible staining in the sub-soil. On this day, the bulk of the contaminated soil was removed from beneath the product pump areas and approximately 80 gallons of free product and gasoline/groundwater was collected by a bailer and placed into 55-gallon drums.

November 5, 2000

No over excavation occurred. Approximately 10 gallons of gasoline/water product was evacuated from Pit #3 from below the former pump island and placed into 55-gallon drums. The soil piles were covered based upon probability of rain showers that evening.

November 6, 2000

Approximately 40 yards of contaminated soil was removed from the most northerly portion of Pit #3 extending into the area of suspected diesel contamination from the previous piping failure at the old pump islands (see figure). Approximately 100 gallons of purged water was removed with the Vactor truck from Pit #1 and Pit #2 and placed into 55-gallon drums.

November 7, 2000

On this day, 29 soil samples were collected at approximately 20 foot intervals from the trench sidewalls and 1 per every 400 square feet of trench bottom. Soil samples were submitted for analysis of TPHG, TPHD, BTEX, and MTBE. Three sets of groundwater samples were collected for analysis of TPHG, BTEX and MTBE.

One groundwater sample was collected for analysis as diesel from pit #3. 6-inch diameter plastic water pipe perforated at six inch intervals was installed in Pit #1, Pit #2 and Pit #3 to create an extraction trench for future groundwater removal and remediation. Pit #1 had approximately 80 feet of line installed, covered by 6 – 12

inches of #3 drain rock covered with pea gravel. Pit #2, one 20-foot of 6-inch perforated pipe covered in the same manner. Pit #3 has a manifold collection system which gravity flows to the area beneath the former dispense island, consisting of approximately 60-feet of 6-inch diameter perforated pipe. All piping was covered with #3 drain rock, placed at grade in the trench bottom, and covered to the surface with pea gravel.

November 8, 2000

The pits were filled with pea gravel to the existing soil levels, except in Pit #3 which was left approximately 1-foot below grade. The site was graded to drain surface water away from the excavation Pit #3 and the fence was reinstalled along the trail.

November 10, 2000

The soil piles were levelled out to promote drainage off the piles and winterized with 6-mil PE sheeting and rubber tires along the base of the pile. A drainage ditch was excavated around the soil piles which directs all run-off to the marsh treatment system.

**Future Work**

Summer 2001

Corrective Actions

We proposed to install stand pipes through the concrete foundation of the aboveground storage tank secondary containment structures and "vacuum" the remaining fuel products into the collection manifold in pit #3 for removal, storage and testing in an aboveground 3500 gallon PE storage tank for testing. If water sample results are within the Arcata WWTP acceptable discharge limits of 25ppm as TPH gasoline the tank will be pumped into the WWTP headworks, if not aeration of the tank and/or dilution will be used to reduce the concentration to within acceptable limits.

Based on analytical results additional over excavation is warranted in the area of Pit #3 and beneath the secondary containment structure. Based on low to non-detectible results near pits 1 and 2 we believe the bulk of contamination was removed and will only warrant groundwater monitoring to determine if groundwater has been impacted.

## RECOMMENDATIONS

Source Removal

The City is proposing to construct a bus barn in the summer of 2002. We propose to do limited additional source removal as per SHN's previous recommendations to excavate approximately 500 cubic yards of soil within the vicinity and south of the existing fuel

island (see figure 2). The excavation limits are noted in the figure and would not extend below the depth of groundwater. The purpose of this excavation is to remove soils from the capillary zone which contain moderate to high hydrocarbon concentrations. This source removal will occur this summer when groundwater is at its lowest conditions and the soils will be characterized, stockpiled and remediated on-site utilizing bio-piles and/or composting within the area shown on figure 3. Following the over-excavation confirmation soil samples would be collected at approximately 1 sample per 400 square feet from the base of excavation and sidewall samples 1 per 20 linear feet. Samples would be analyzed for TPHG, TPHD, v-tex and MTBE as previously described in the report by SHN Consulting Engineers.

Groundwater Remediation/Recovery

We propose to install additional recovery trenches, piping in the over-excavation area which would allow for the City to extract the groundwater. Store it in the aboveground 3,500-gallon polyethylene tank and treat it through the Wastewater Treatment Plant if the levels are acceptable.

This trench would act as a remedial corrective action for the dissolved phase hydrocarbons following source removal.

Groundwater Monitoring Well Water Installation

Based on the analytical results from the proposed over-excavation and possible groundwater grab samples, monitoring wells are proposed to be installed on the site. We propose to install between 5 to 7 monitoring wells to monitor the extent of hydrocarbon contamination in the groundwater surrounding the suspected source area. The proposed monitoring wells are shown in figure _____.

The proposed monitoring well locations will be submitted under a follow-up report with the following over-excavation and confirmation sampling of the 500 cubic yards of material. The monitoring wells would be initially sampled for TPHD, TPHG, BTEX and MTBE.

Proposed Schedule

The proposed schedule for the over-excavation of 500 cubic yards of suspected contaminated soil is scheduled for the summer (August) )of 2001. The City will perform this work utilizing City staff. The City will install the groundwater collection recovery sump.

We look forward to your response and approval of this work plan for future over-excavation at the City of Arcata Corporation Yard. Please do not hesitate to call me at (707) 825-2173 if you have any questions or we can be of additional service.

Sincerely,

R. Charles (Doby) Class
Deputy Public Works Director

RCC:mlc

The City of Arcata has applied for a Coastal Development Permit for the excavation, stockpiling and remediation of contaminated soils to occur within the Corporation Yard on April 17, 2001. We are awaiting a response from the Coastal Commmision.

City of Arcata. 2016. *Adopted Floodplain Ordinance.* Adopted 11/02/2016.

**ORDINANCE NO. 1479**

**AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF ARCATA AMENDING THE ARCATA MUNICIPAL CODE PERTAINING TO FLOOD HAZARD MITIGATION STANDARDS**

The City Council of the City of Arcata does ordain as follows:

Section 1: Title VII—Building Regulations, Chapter 4—Flood Hazard Mitigation Standards of the Arcata Municipal Code is hereby adopted as follows:

**TITLE VIII—Building Regulations**
**CHAPTER 4—Flood Hazard Mitigation Standards**

**SEC. 8400. Purpose.**

The provisions of this Chapter are intended to protect the public health, safety, and general welfare, and to minimize public and private losses due to flood conditions in specific areas by minimum floodplain standards designed:

A. To protect human life and health;

B. To minimize expenditure of public money for costly flood control projects;

C. To minimize the need for rescue and relief efforts associated with flooding and generally undertaken at the expense of the general public;

D. To minimize prolonged business interruptions;

E. To minimize damage to public facilities and utilities such as water and gas mains, electric, telephone and sewer lines, streets and bridges located in areas of special flood hazard;

F. To help maintain a stable tax base by providing for the second use and development of areas of special flood hazard so as to minimize future flood blight areas;

G. To insure that potential buyers are notified that property is in an area of special flood hazard; and

H. To insure that those who occupy the areas of special flood hazard assume responsibility for their actions.

This Chapter also implements regulations to meet Federal Emergency Management Agency (FEMA) requirements for managing flood hazards.

**SEC. 8401. Definitions.** Unless a provision explicitly states otherwise, the following terms and phrases, as used in the Chapter, are defined as follows:

"**A zone**" means "Special flood hazard area," as defined herein.

"**Accessory structure**" means a structure that is either:

A. Solely for the parking of no more than 2 cars; or

B. A small, low cost shed for limited storage, less than 150 square feet and $1,500 in value.

"**Accessory use**" means a use which is incidental and subordinate to the principal use of the parcel of land on which it is located.

"**Alluvial fan**" means a geomorphologic feature characterized by a cone or fan-shaped deposit of boulders, gravel, and fine sediments that have been eroded from mountain slopes, transported by flood flows, and then deposited on the valley floors, and which is subject to flash flooding, high velocity flows, debris flows, erosion, sediment movement and deposition, and channel migration.

"**Apex**" means a point on an alluvial fan or similar landform below which the flow path of the major stream that formed the fan becomes unpredictable and alluvial fan flooding can occur.

**"Area of shallow flooding"** means a designated AO, AH or Zone on the Flood Insurance Rate Map (FIRM). The base flood depth ranges from one to three feet; a clearly defined channel does not exist; the path of flooding is unpredictable and indeterminate; and velocity flow may be evident. Such flooding is characterized by ponding or sheet flow.

"**Area of special flood hazard**" means "Special flood hazard area" as defined herein.

**"Base flood"** means a flood which has a one percent chance of being equaled or exceeded in any given year (also called the "100-year flood"). Base flood is the term used throughout this Chapter.

"**Base flood elevation**" (BFE) means the elevation shown on the Flood Insurance Rate Map for Zones AE, VE, and B and C that indicates the water surface elevation resulting from a flood that has a 1-percent or greater chance of being equaled or exceeded in any given year.

**"Basement"** means any area of a building having its floor subgrade—i.e. below ground level—on all sides.

**"Breakaway wall"** means any type of wall, whether solid or lattice, and constructed of concrete, masonry, wood, metal, plastic or any other suitable building material that is not part of the structural support of the building, and is designed to break away under abnormally high tides or wave action without causing any damage to the structural integrity of the building on which they are used or any building to which they might be carried by flood waters. A breakaway wall shall have a safe design loading resistance of not less than ten and no more than twenty pounds per square foot. The use of breakaway walls must be certified by a registered civil engineer or architect and shall meet the following conditions:

A. Breakaway wall collapse shall result from a water load less than that which would occur during the base flood; and
B. The elevated portion of the building shall not incur structural damage due to the effects of wind and water loads acting simultaneously in the event of the base flood.

**"Building**" means "Structure."

**"Coastal High Hazard Area"** means an area of special flood hazard extending from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high velocity wave action from storms or seismic sources. It is an area subject to high velocity waters, including

coastal and tidal inundation or tsunamis. The area is designated on a Flood Insurance Rate Map (FIRM) as Zone VE, or V.

"**Development**" means any man-made change to improved or unimproved real estate, including but not limited to buildings or other structures, mining, dredging, filling, grading, paving, excavation or drilling operations or storage of equipment or materials.

"**Encroachment**" means the advance or infringement of uses, plant growth, fill, excavation, buildings, permanent structures or development into a floodplain which may impede or alter the flow capacity of a floodplain.

**"Exception"** means a grant of relief from the requirements of this Chapter pursuant to Section 8406, which permits construction in a manner that would otherwise be prohibited by this Chapter.

"**Existing manufactured home park or subdivision**" means a manufactured home park or subdivision for which the construction of facilities for servicing the lots on which the manufactured homes are to be affixed (including, at a minimum, the installation of utilities, the construction of streets, and either final site grading or the pouring of concrete pads) is completed before November 4, 2016 .

"**Expansion to an existing manufactured home park or subdivision**" means the preparation of additional sites by the construction of facilities for servicing the lots on which the manufactured homes are to be affixed (including the installation of utilities, the construction of streets, and either final site grading or the pouring of concrete pads).

"**Flood, flooding, or flood water**" means:

A. A general and temporary condition of partial or complete inundation of normally dry land areas from the overflow of inland or tidal waters; the unusual and rapid accumulation or runoff of surface waters from any source; and/or mudslides (i.e., mudflows); and

B. The condition resulting from flood-related erosion.

**"Flood Boundary, and Floodway Map (FBFM)"** means the official map on which the Federal Emergency Management Agency or Federal Insurance Administration has delineated both the areas of special flood hazards and the floodway.

**"Flood Insurance Rate Map (FIRM)"** means the official map on which the Federal Emergency Management Agency or Federal Insurance Administration has delineated both the areas of special flood hazards and the risk premium zones applicable to the community.

**"Flood Insurance Study"** means the official report provided by the Federal Insurance Administration that includes flood profiles, the FIRM, the Flood Boundary and Floodway Map, and the water surface elevation of the base flood.

"**Floodplain or flood-prone area**" means any land area susceptible to being inundated by water from any source—see "Flooding."

"**Floodplain Administrator**" is the community official designated by title to administer and enforce the floodplain management regulations .

**“Floodplain management**” means the operation of an overall program of corrective and preventive measures for reducing flood damage and preserving and enhancing, where possible, natural resources in the floodplain, including but not limited to emergency preparedness plans, flood control works, flood plain management regulations and open space plans.

**“Floodplain management regulations”** means Chapter 4 of Title VIII of the Arcata Municipal Code and any zoning ordinances, subdivision regulations, building codes, health regulations, special purpose ordinances (such as grading ordinance and erosion control) and other applications of police power which control development in flood-prone areas. This term describes federal, state or local regulations in any combination, which provide standards for the purpose of flood loss and damage prevention and reduction.

**“Floodproofing”** means any combination of structural and non-structural additions, changes, or adjustments to structures which reduce or eliminate flood damage to real estate or improved real property, water and sanitary facilities, structures and their contents. For guidelines on dry and wet floodproofing, see FEMA Technical Bulletins TB 1-93, TB 3-93 and TB 7-93.

**“Floodway”** means the channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than one foot. Also referred to as "Regulatory Floodway."

**“Floodway fringe”** means that area of the floodplain on either side of the "Regulatory Floodway" where encroachment may be permitted.

"**Fraud and victimization**" as related to Section 8406 of this Chapter, means that the variance granted must not cause fraud on or victimization of the public. In examining this requirement, the City of Arcata will consider the fact that every newly constructed building adds to government responsibilities and remains a part of the community for fifty to one-hundred years. Buildings that are permitted to be constructed below the base flood elevation are subject during all those years to increased risk of damage from floods, while future owners of the property and the community as a whole are subject to all the costs, inconvenience, danger, and suffering that those increased flood damages bring. In addition, future owners may purchase the property, unaware that it is subject to potential flood damage, and can be insured only at very high flood insurance rates.

**“Functionally Dependent Use”** means a use that cannot perform its intended purpose unless it is located or carried out in close proximity to water. The term includes only docking facilities, port facilities that are necessary for the loading and unloading of cargo or passengers, and ship building and ship repair facilities, but does not include long-term storage or related manufacturing facilities.

"**Governing body**" means the City Council of the City of Arcata.

"**Hardship**" as related to Section 8406 of this Chapter means the exceptional hardship that would result from a failure to grant the requested exception. The City of Arcata requires that the exception be unusual and peculiar to the property involved. Mere economic or financial hardship alone is not exceptional. Inconvenience, aesthetic considerations, physical handicaps, personal preferences, or the disapproval of one's neighbors likewise cannot, as a rule, qualify as an exceptional hardship. All of these problems can be resolved through other means without granting an exception, even if the alternative is more expensive, or requires the property owner to build elsewhere or put the parcel to a different use than originally intended.

**“Highest adjacent grade”** means the highest natural elevation of the ground surface prior to construction next to the proposed walls of a structure.

"**Historic structure**" means any structure that is:

A. Listed individually in the National Register of Historic Places (a listing maintained by the Department of Interior) or preliminarily determined by the Secretary of the Interior as meeting the requirements for individual listing on the National Register;
B. Certified or preliminarily determined by the Secretary of the Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined by the Secretary to qualify as a registered historic district;
C. Individually listed on a state inventory of historic places in states with historic preservation programs which have been approved by the Secretary of Interior; or
D. Individually listed on a local inventory of historic places in communities with historic preservation programs that have been certified either by an approved state program as determined by the Secretary of the Interior or directly by the Secretary of the Interior in states without approved programs.

"**Levee**" means a man-made structure, usually an earthen embankment, designed and constructed in accordance with sound engineering practices to contain, control or divert the flow of water so as to provide protection from temporary flooding.

"**Levee system**" means a flood protection system which consists of a levee, or levees, and associated structures, such as closure and drainage devices, which are constructed and operated in accord with sound engineering practices.

"**Lowest floor**" means the lowest floor of the lowest enclosed area, including basement (see “Basement,” defined herein).

A. An unfinished or flood resistant enclosure below the lowest floor that is usable solely for parking of vehicles, building access or storage in an area other than a basement area, is not considered a building’s lowest floor provided it conforms to applicable non-elevation design requirements, including, but not limited to:

    1. The flood openings standard in Section 8405.A.5;
    2. The anchoring standards in Section 8405.A.1;
    3. The construction materials and methods standards in Section 8405.A.2; and
    4. The standards for utilities in Section 8405.B.

B. For residential structures, all subgrade enclosed areas are prohibited as they are considered to be basements (see “Basement” defined herein). This prohibition includes below-grade garages and storage areas.

"**Manufactured home**" means a structure, transportable in one or more sections, which is built on a permanent chassis and is designed for use with or without a permanent foundation when attached to the required utilities. The term "manufactured home" does <u>not</u> include a "recreational vehicle".

"**Manufactured home park or subdivision**" means a parcel (or contiguous parcels) of land divided into two or more manufactured home lots for rent or sale.

**“Mean Sea Level”** means for purposes of the National Flood Insurance Program, the National Geodetic Vertical Datum (NGVD) of 1929, the North American Vertical Datum (NAVD) of 1988, or other data, to which base flood elevations shown on a community's Flood Insurance Rate Map are referenced.

**“National Flood Insurance Program (NFIP)”** means the federal program that authorizes the sale of federally subsidized flood insurance in communities where such flood insurance is not available privately.

**“New construction”** means, for purposes of this Chapter, structures for which the "start of construction" commenced on or after the effective date of a floodplain management regulation adopted by this community.

"**New manufactured home park or subdivision**" means a manufactured home park or subdivision for which the construction of facilities for servicing the lots on which the manufactured homes are to be affixed (including at a minimum, the installation of utilities, the construction of streets, and either final site grading or the pouring of concrete pads) is completed on or after November 5, 2016.

"**Obstruction**" includes, but is not limited to, any dam, wall, wharf, embankment, levee, dike, pile, abutment, protection, excavation, channelization, bridge, conduit, culvert, building, wire, fence, rock, gravel, refuse, fill, structure, vegetation or other material in, along, across or projecting into any watercourse which may alter, impede, retard or change the direction and/or velocity of the flow of water, or due to its location, its propensity to snare or collect debris carried by the flow of water, or its likelihood of being carried downstream.

**“100-Year Flood”** means "base flood."

**“Primary frontal dune”** means a continuous or nearly continuous mound or ridge of sand with relatively steep seaward and landward slopes immediately landward and adjacent to the beach and subject to erosion and overtopping from high tides and waves during major coastal storms. The inland limit of the primary frontal dune occurs at the point where there is a distinct change from a relatively mild slope.

“**Program deficiency**” means a defect in a community’s floodplain management regulations or administrative procedures that impairs effective implementation of those floodplain management regulations.

“**Public safety and nuisance”** means, for purposes related to Section 8406 of this Chapter, that the granting of a variance must not result in anything which is injurious to safety or health of an entire community or neighborhood, or any considerable number of persons, or unlawfully obstructs the free passage or use, in the customary manner, of any navigable lake, or river, bay, stream, canal, or basin.

**“Recreational vehicle”** means a vehicle which is:

A. Built on a single chassis;
B. 400 square feet or less when measured at the largest horizontal projection;
C. Designed to be self-propelled or permanently towable by a light-duty truck; and
D. Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational, camping, travel, or seasonal use.

"**Regulatory floodway**" means the channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than one foot.

**"Remedy a violation"** means to bring the structure or other development into compliance with State or local flood plain management regulations, or, if this is not possible, to reduce the impacts of its noncompliance. Ways that impacts may be reduced include protecting the structure or other affected development from flood damages, implementing the enforcement provisions of the Article or otherwise deterring future similar violations, or reducing Federal financial exposure with regard to the structure or other development.

**"Riverine"** means relating to, formed by, or resembling a river (including tributaries), street, brook, etc.

**"Sand dunes"** means naturally occurring accumulations of sand in ridges or mounds landward of the beach.

**"Special Flood Hazard Area (SFHA)"** means an area in the floodplain subject to a one percent or greater chance of flooding in a given year. It is shown on an FHBM or FIRM as Zones A, AE, V, VE or X.

**"Start of construction"** includes substantial improvement and other proposed new development, and means the date the building permit was issued, provided the actual start of construction, repair, reconstruction, rehabilitation, addition, placement, or other improvement was within 180 days of the permit date. The actual start means either the first placement of permanent construction of a structure on a site, such as the pouring of slab or footings, the installation of piles, the construction of columns, or any work beyond the stage of excavation; or the placement of a manufactured home on a foundation. Permanent construction does not include land preparation, such as clearing, grading and filling; nor does it include the installation of streets and/or walkways; nor does it include excavation for a basement, footings, piers, or foundations or the erection of temporary forms; nor does it include the installation on the property of accessory buildings, such as garages or sheds not occupied as dwelling units or not part of the main structure. For a substantial improvement, the actual start of construction means the first alteration of any wall, ceiling, floor or other structural part of a building, whether or not that alteration affects the external dimensions of the building.

**"Structure"** means a walled and roofed building that is principally above ground; this includes a gas or liquid storage tank or a manufactured home.

"**Substantial damage**" means damage of any origin sustained by a structure whereby the cost of restoring the structure to its before damaged condition would equal or exceed 50 percent of the market value of the structure before the damage occurred.

"**Substantial improvement**" means any reconstruction, rehabilitation, addition, or other improvement of a structure, the cost of which equals or exceeds 50 percent of the market value of the structure before the "start of construction" of the improvement. This term includes structures which have incurred "substantial damage," regardless of the actual repair work performed. The term does not, however, include either:

1. Any project for improvement of a structure to correct existing violations or state or local health, sanitary, or safety code specifications which have been identified by the local code

enforcement official and which are the minimum necessary to assure safe living conditions; or

2. Any alteration of a "historic structure," provided that the alteration will not preclude the structure's continued designation as a "historic structure."

The Floodplain Administrator shall utilize the FEMA publication: “Substantial Improvement/ Substantial Damage Desk Reference *FEMA P-758 / May 2010,”* as amended or replaced by additional FEMA publication for guidance in identifying substantial improvements..

"**Variance**" means a grant of relief from the requirements of this ordinance which permits construction in a manner that would otherwise be prohibited by this ordinance.

**“Violation”** means the failure of a structure or other development to be fully compliant with the community's flood plain management regulations. A structure or other development without the elevation certificate, other certifications, or other evidence of compliance required in this Article is presumed to be in violation until such time as that documentation is provided.

"**Water surface elevation**" means the height, in relation to the National Geodetic Vertical Datum (NGVD) of 1929, North American Vertical Datum (NAVD) of 1988, or other datum, of floods of various magnitudes and frequencies in the floodplains of coastal or riverine areas.

"**Watercourse**" means a lake, river, creek, stream, wash, arroyo, channel or other topographic feature on or over which waters flow at least periodically. Watercourse includes specifically designated areas in which substantial flood damage may occur.

**SEC. 8402. Applicability.**

**A. Basis for establishing areas of special flood hazards.** The areas of special flood hazard identified by the Federal Insurance Administration (FIA) of the Federal Emergency Management Agency (FEMA) in a scientific and engineering report entitled "Flood Insurance Study" for the City of Arcata dated November 5, 1997, and accompanying Flood Insurance Rate Maps (FIRMS), and the Humboldt County Flood Insurance Rate Map Index dated February 8, 1999, and Flood Insurance Study dated August 5, 1986 and Flood Boundary and Floodway Maps, and all subsequent amendments and/or revisions are hereby adopted by reference and declared to be a part of this Land Use Code, and this Chapter. This Flood Insurance Study and attendant mapping is the minimum area of applicability of this Chapter and may be supplemented by studies for other areas which allow implementation of this Chapter and which are recommended to the City of Arcata by the Flood Plain Administrator. The Flood Insurance Study is on file at the Engineering Department of the City of Arcata

**B. Compliance with Chapter required.** No structure or land shall hereafter be constructed, located, extended, converted, or altered without full compliance with the terms of this Chapter, and other applicable regulations including the City of Arcata Land Use Code (LUC). Violations of the provisions of this Chapter by failure to comply with any of its requirements (including violations of conditions and safeguards established in connection with conditions) may constitute a misdemeanor, and be charged by the City Attorney as either an infraction or misdemeanor. Nothing herein shall prevent the City from taking lawful action as is necessary to prevent or remedy any violation.

**C. Abrogation and greater restrictions.** This Chapter is not intended to repeal, abrogate, or impair any existing easements, covenants, or deed restrictions. However, where this Chapter and another regulation, easement, covenant, or deed restriction conflict or overlap, whichever imposes the more stringent restrictions shall prevail.

**D. Interpretation.** In the interpretation and application of this Chapter, all provisions shall be:

1. Considered as minimum requirements;

2. Liberally construed in favor of the governing body; and,

3. Deemed neither to limit nor repeal any other powers granted under state statutes.

**E. Warning and disclaimer of liability.** The degree of flood protection required by this Chapter is considered reasonable for regulatory purposes and is based on scientific and engineering considerations. Larger floods can and will occur on rare occasions. Flood heights may be increased by man-made or natural causes. This Chapter does not imply that land outside the areas of special flood hazards, or uses permitted within such areas will be free from flooding or flood damages. This Chapter shall not create liability on the part of the City of Arcata, any officer or employee thereof, the Federal Emergency Management Agency, or State of California, for any flood damages that result from reliance on this Chapter or any administrative decision lawfully made in compliance with this Chapter.

**SEC. 8403. Administration**.

**A. Designation of Floodplain Administrator.** The City Engineer is hereby appointed to administer, implement, and enforce this Chapter by granting or denying development permits in accordance with its provisions.

**B. Duties and responsibilities of Floodplain Administrator.** The Floodplain Administrator shall have the following duties and responsibilities.

1. Permit review**.** The Floodplain Administrator shall review all development permits to determine that:

    a) The permit requirements of this Chapter have been satisfied including determination of substantial improvement and substantial damage of existing structures;

    b) All other required state and federal permit requirements have been obtained;

    c) The site is reasonably safe from flooding;

    d) The proposed development does not adversely affect the carrying capacity of areas where base flood elevations have been determined but a floodway has not been designated. For purposes of this Chapter, "adversely affects" means that the cumulative effect of the proposed development when combined with all other existing and anticipated development will increase the water surface elevation of the base flood more than one foot at any point; and

    e) All Letters of Map Revision (LOMR's) for flood control projects are approved prior to the issuance of building permits. Building permits must not be issued based on Conditional Letters of Map Revision (CLOMR's). Approved CLOMR's allow construction of the proposed flood control project and land preparation as specified in the "start of construction" definition.

2. Notification of Other Agencies. Other agencies shall be notified as follows for the following circumstances:

   a) Alteration or relocation of a watercourse:

      (1) Notify adjacent communities and the California Department of Water Resources prior to alteration or relocation;

      (2) Submit evidence of such notification to the Federal Emergency Management Agency; and

      (3) Assure that the flood carry capacity within the altered or relocated portion of said watercourse is maintained.

   b) Base Flood Elevation changes due to physical alterations:

      (1) Within 6 months of information becoming available or project completion, whichever comes first, the Floodplain Administrator shall submit or assure that the permit applicant submits technical or scientific data to FEMA for a Letter of Map Revision (LOMR).

      (2) All LOMR's for flood control projects are approved prior to the issuance of building permits. Building Permits must not be issued based on Conditional Letters of Map Revision (CLOMR's). Approved CLOMR's allow construction of the proposed flood control project and land preparation as specified in the "start of construction" definition.

   Such submissions are necessary so that upon confirmation of those physical changes affecting flooding conditions, risk premium rates and floodplain management requirements are based on current data.

   c) Changes in Corporate Boundaries. Notify FEMA in writing whenever the corporate boundaries have been modified by annexation or other means and include a copy of the map of the community clearly delineating the new corporate limits.

3. Certifications**.** Obtain and maintain for public inspection and make available as needed the certifications required by Section 8405 (Standards for Flood Hazard Reduction).

4. Interpretations**.** Make interpretations where needed, as to the location of the boundaries of the areas of special flood hazards. Where there appears to be a conflict between a mapped boundary and actual field conditions, grade and base flood elevations shall be used to determine the boundaries of the special flood hazard area. The person contesting the location of the boundary shall be given a reasonable opportunity to appeal the interpretation provided in Section 8406 (Flood Standard Exceptions).

5. Base flood elevation data. When base flood elevation data has not been provided in accordance with Section 8402.A (Basis for establishing areas of special flood hazards), the Floodplain Administrator shall obtain, review, and reasonably utilize any base flood elevation and floodway data available from a federal or state agency, or other source, in the administration and review process.

**C. Enforcement.** Take action to remedy violations of this Chapter as specified in this Chapter or other applicable law.

**SEC. 8404. Permit Requirements.**

A Development Permit shall be obtained before construction or development within any area of special flood hazard identified in compliance with Section 8402.A (Basis for establishing areas of special flood hazards). Application for a Development Permit shall include:

A. Plans in duplicate, drawn to scale, showing:

1. Location, dimensions, and elevation of the area in question, existing or proposed structures, storage of materials and equipment and their location;
2. Proposed locations of water supply, sanitary sewer, and other utilities;
3. Grading information showing existing and proposed contours, any proposed fill, and drainage facilities;
4. Location of the regulatory floodway when applicable;
5. Base flood elevation information as specified in Section 8403.B.5;
6. Proposed elevation in relation to mean sea level, of the lowest floor (including basement) of all structures; and
7. Proposed elevation in relation to mean sea level to which any nonresidential structure will be floodproofed, as required in Section 8405.A.4.

B. Proposed elevation in relation to mean sea level, of the lowest floor (including basement) of all structures;

C. Proposed elevation in relation to mean sea level to which any structure will be floodproofed if required in Section 8405.A.4 (Elevation and floodproofing - Nonresidential construction), that is also in compliance with all applicable City regulations including those in the Land Use Code (LUC).

D. All appropriate certifications required by this Chapter;

E. Description of the extent to which any watercourse will be altered or relocated as a result of proposed development; and

F. Documentation of CEQA compliance for all discretionary projects.

**SEC. 8405. Standards for Flood Hazard Reduction**

**A. Construction standards.** The following standards apply in all areas of special flood hazards.

1. Anchoring.

   (a) All new construction and substantial improvements shall be anchored to prevent flotation, collapse or lateral movement of the structure resulting from hydrodynamic and hydrostatic loads, including the effects of buoyancy.

   (b) All manufactured homes shall meet the anchoring standards of 8405.D (Mobile homes, manufactured homes, and mobile home parks and subdivisions).

2. Construction materials and methods**.**

a) All new construction and substantial improvements shall be constructed with materials and utility equipment resistant to flood damage.
b) All new construction and substantial improvements shall be constructed using methods and practices that minimize flood damage.

c) All new construction and substantial improvements shall be constructed with electrical, heating, ventilation, plumbing and air conditioning equipment and other service facilities that are designed and/or located so as to prevent water from entering or accumulating within the components during conditions of flooding.

d) Within Zones AH or AO, adequate drainage paths around structures on slopes to guide flood waters around and away from proposed structures are required.

3. Elevation and flood proofing—Residential construction**.** Upon completion of the structure, the elevation of the lowest floor, including basement, shall be certified by a registered civil engineer or licensed surveyor, and verified by the Building Inspector, to be properly elevated. The certification and verification shall be provided to the Floodplain Administrator.

All new construction or substantial improvements of residential structures shall have the lowest floor, including basement:

a) In AE Zones, elevated at least one foot above the base flood elevation.

b) In an AO Zone, elevated above the highest adjacent grade to a height at least one foot above the depth number specified in feet on the FIRM, or elevated at least 2 feet above the highest adjacent grade if no depth number is specified.

c) In an A Zone, without BFE's specified on the FIRM (unnumbered A Zone), elevated at least one foot above the base flood elevation, as determined under Section 9.60.050.B.5.

d) Manufactured homes shall also meet the standards in Subsection D.

4. Elevation and flood proofing—Nonresidential construction. Nonresidential construction, new or substantial Improvements, shall either be elevated to conform with Subsection A.3, above (Elevation and flood proofing—Residential construction), or:

a) Be flood proofed, together with attendant utility and sanitary facilities, below the elevation specified in Subsection A.3, so that the structure is watertight with walls substantially impermeable to the passage of water; and

b) Have structural components capable of resisting hydrostatic and hydrodynamic loads and effects of buoyancy, and;

c) Be certified by a registered civil engineer or licensed surveyor that the standards of this subsection are satisfied. The certification shall be provided to the Floodplain Administrator.

5. Flood Openings. All new construction and substantial improvements of structures with fully enclosed areas below the lowest floor (excluding basements) that are usable solely for parking of vehicles, building access or storage, and which are subject to flooding, shall be

designed to automatically equalize hydrostatic flood forces on exterior walls by allowing for automatic entry and exit of floodwater. Designs for meeting this requirement must meet the following minimum criteria:

a) For non-engineered openings:

(1) Have a minimum of two openings on different sides having a total net area of not less than one square inch for every square foot of enclosed area subject to flooding;
(2) The bottom of all openings shall be no higher than one foot above grade;
(3) Openings may be equipped with screens, louvers, valves or other coverings or devices provided that they permit the automatic entry and exit of floodwater; and
(4) Buildings with more than one enclosed area must have openings on exterior walls for each area to allow flood water to directly enter; or

b) Be certified by a registered civil engineer or architect.

6. Garages and low cost Accessory Structures.

a) Attached Garages.

(1) A garage attached to a residential structure, constructed with the garage floor slab below the BFE, must be designed to allow for the automatic entry of flood waters. See Subsection 8405.A.5. Areas of the garage below the BFE must be constructed with flood resistant materials. See Subsection 8405.A.2.

(2) A garage attached to a nonresidential structure must meet the above requirements or be dry floodproofed. For guidance on below grade parking areas, see FEMA Technical Bulletin TB-6.

b) Detached garages and accessory structures.

(1) "Accessory structures" used solely for parking (2 car detached garages or smaller) or limited storage (small, low-cost sheds), as defined in 8401, may be constructed such that its floor is below the base flood elevation (BFE), provided the structure is designed and constructed in accordance with the following requirements:

i. Use of the accessory structure must be limited to parking or limited storage;

ii. The portions of the accessory structure located below the BFE must be built using flood-resistant materials;

iii. The accessory structure must be adequately anchored to prevent flotation, collapse and lateral movement;

iv. Any mechanical and utility equipment in the accessory structure must be elevated or floodproofed to or above the BFE;

v. The accessory structure must comply with floodplain encroachment provisions in Subsection 8405.F; and

vi. The accessory structure must be designed to allow for the automatic entry of

flood waters in accordance with Subsection 8405.F.

(2) Detached garages and accessory structures not meeting the above standards must be constructed in accordance with all applicable standards in Section 8405.

**B. Utilities.** All new and replacement water supply and sanitary sewage systems shall be designed to prohibit the infiltration of flood waters into the system and discharge from systems into flood waters. On-site waste disposal systems shall be located to avoid impairment to them, or contamination from them during flooding.

**C. Subdivisions.**

1. All new subdivision proposals and other proposed development, including proposals for manufactured home parks and subdivisions, greater than 50 lots or 5 acres, whichever is the lesser, shall:

   a) Identify the Special Flood Hazard Areas (SFHA) and Base Flood Elevations (BFE).
   b) Identify the elevations of lowest floors of all proposed structures and pads on the final plans.
   c) If the site is filled above the base flood elevation, the following as-built information for each structure shall be certified by a Registered Civil Engineer or Licensed Land Surveyor and provided as part of an application for a Letter of Map Revision based on Fill (LOMR-F) to the Floodplain Administrator;

      (1) Lowest floor elevation.
      (2) Pad elevation.
      (3) Lowest adjacent grade.

2. All subdivision proposals and other proposed development shall be consistent with the need to minimize flood damage.
3. All subdivision proposals and other proposed development shall have public utilities and facilities such as sewer, gas, electrical and water systems located and constructed to minimize flood damage.
4. All subdivisions and other proposed development shall provide adequate drainage to reduce exposure to flood hazards.

**D. Mobile homes, manufactured homes, and mobile home parks and subdivisions.**

1. All manufactured homes that are placed or substantially improved on sites located: (1) outside of a manufactured home park or subdivision; (2) in a new manufactured home park or subdivision; (3) in an expansion to an existing manufactured home park or subdivision; or (4) in an existing manufactured home park or subdivision upon which a manufactured home has incurred "substantial damage" as the result of a flood, shall:

   a) Within Zones A, AH, and AE on the community's Flood Insurance Rate Map, be elevated on a permanent foundation such that the lowest floor of the manufactured home is elevated to or above the base flood elevation and be securely fastened to an adequately anchored foundation system to resist flotation, collapse, and lateral movement.

   b) Within Zones V, and VE on the community's Flood Insurance Rate Map, meet the requirements of Section 8405.G.

2. All manufactured homes to be placed or substantially improved on sites in an existing manufactured home park or subdivision within Zones A, AH, AE, V, and VE on the community's Flood Insurance Rate Map that are not subject to the provisions of Subsection 8405.D.1 will be securely fastened to an adequately anchored foundation system to resist flotation, collapse, and lateral movement, and be elevated so that either the:

    a) Lowest floor of the manufactured home is at or above the base flood elevation; or

    b) Manufactured home chassis is supported by reinforced piers or other foundation elements of at least equivalent strength that are no less than 36 inches in height above grade.

Upon the completion of the structure, the elevation of the lowest floor including basement shall be certified by a Registered Civil Engineer or Licensed Land Surveyor, and verified by the community building inspector to be properly elevated. Such certification and verification shall be provided to the Floodplain Administrator.

E. **Recreational vehicles.**

1. Each recreational vehicle placed on a site within Zones A, AH, and AE on the Flood Insurance Rate Map shall either:

    a) Be on the site for fewer than 180 consecutive days, and be fully licensed and ready for highway use. (A recreational vehicle is ready for highway use if it is on its wheels or jacking system, is attached to the site only by quick disconnect type utilities and security devices, and has no permanently attached additions), or

    b) Meet the permit requirements of Section 8404 (Permit Requirements), and the elevation and anchoring requirements for manufactured homes in Subsection D.

2. A recreational vehicle placed on sites within Zones V and VE on the Flood Insurance Rate Map shall comply with the requirements of Subsections F.1, and G.

**F. Floodways.** Within the areas of special flood hazard established in Section 8402.A (Applicability—Basis for establishing areas of special flood hazards), are areas designated as floodways. Since the floodway is an extremely hazardous area due to the velocity of flood waters which carry debris, potential projectiles, and erosion potential, the following provisions apply:

1. Prohibit encroachments, including fill, new construction, substantial improvements, and other development unless certification by a registered civil engineer is provided demonstrating that encroachments shall not result in any increase in flood levels during the occurrence of the base flood discharge.

2. If the requirements of this Subsection F are satisfied, all new construction and substantial improvements shall comply with all other applicable flood hazard reduction provisions of this Chapter.

Until a regulatory floodway is adopted, no new construction, substantial development, or other development (including fill) shall be permitted within Zones A and AE, unless it is demonstrated that the cumulative effect of the proposed development, when combined with all other development, will not increase the water surface elevation of the base flood more than 1 foot at any point within the City of

Arcata.

**G. Coastal High Hazard Areas.** Unless exempted by General Plan: 2020 policies PS-4b, PS-4g, and any other applicable City regulation or standard, it is the general policy of the City not to allow any development in the area identified as Coastal Flooding (V Zones) on the FIRM Map.

**H. Exceptions.** The improvement, repair, or rehabilitation of an existing residential building or structure, or an existing nonresidential building or structure built prior to May 2, 1983, where the cost of the improvement, repair, or rehabilitation does not equal or exceed 50 percent of the replacement cost of the structure shall not be subject to the standards and requirements of this Section. In all circumstances, exceptions may be made only in accordance with the requirements in Section 8406 (Flood Standard Exceptions), in compliance with Section 60.6 of the National Flood Insurance Program Regulations, Federal Emergency Management Agency, Federal Insurance Administration and in California Administrative Code Title 14 for Coastal Zone Areas.

**SEC. 8406. Flood Standard Exceptions.**

The issuance of an exception is for floodplain management purposes only. Insurance premium rates are determined by statute according to actuarial risk and will not be modified by the granting of an exception.

The variance criteria set forth in this section of the ordinance are based on the general principle of zoning law that variances pertain to a piece of property and are not personal in nature. A variance may be granted for a parcel of property with physical characteristics so unusual that complying with the requirements of this ordinance would create an exceptional hardship to the applicant or the surrounding property owners. The characteristics must be unique to the property and not be shared by adjacent parcels. The unique characteristic must pertain to the land itself, not to the structure, its inhabitants, or the property owners.

It is the duty of the City of Arcata to help protect its citizens from flooding. This need is so compelling and the implications of the cost of insuring a structure built below flood level are so serious that exceptions from the flood elevation or from other requirements in the flood ordinance are quite rare. The long term goal of preventing and reducing flood loss and damage can only be met if exceptions are strictly limited. Therefore, the exception guidelines provided in this ordinance are more detailed and contain multiple provisions that must be met before an exception can be properly granted. The criteria are designed to screen out those situations in which alternatives other than an exception are more appropriate.

Exceptions to Section 8405 (Standards for Flood Hazard Reduction) may be granted by the Floodplain Administrator in compliance with the following provisions.

**A. Notices and hearings.** The processing of a Flood Standard Exception shall occur in compliance with the provisions of Section 9.72.080 for Minor Use Permits.

**B. Factors to be considered.** In reviewing and deciding upon applications for Flood Standard Exceptions, the Floodplain Administrator shall consider all technical evaluations, all relevant factors, standards specified in other sections of this Chapter, and the:

1. Danger that materials may be swept onto other lands to the injury of others;

2. Dangers to life and property because of flooding or erosion damage;

3. Susceptibility of the proposed facility and its contents to flood damage and the effect of such damage on the individual owner.

4. Importance of the services provided by the proposed facility to the community;

5. Necessity to the facility of a waterfront location, where applicable;

6. Availability of alternative locations for the proposed use which are not subject to flooding or erosion damage;

7. Compatibility of the proposed use with existing and anticipated development;

8. Relationship of the proposed use to the comprehensive plan and floodplain management program for that area;

9. Safety of access to the property in time of flood for ordinary and emergency vehicles;

10. Expected heights, velocity, duration, rate of rise, and sediment transport of the flood waters expected at the site; and,

11. Costs of providing governmental services during and after flood conditions, including maintenance and repair of public utilities and facilities such as sewer, gas, electrical, and water system, and streets and bridges.

**C. Exception criteria.** Generally, a Flood Standard Exception may be issued for new construction and substantial improvements to be erected on a lot of one-half acre or less in size contiguous to and surrounded by lots with existing structures constructed below the base flood level, provided that the issues listed in Subsections B.1 through B.11 have been fully considered. As lot size increases beyond one-half acre, the technical justification required for issuing the Exception increases.

1. An Exception may be issued for the repair, rehabilitation, or restoration of a historic structure upon a determination that the proposed repair, rehabilitation, or restoration will not preclude the structure's continued designation as an historic structure and the exception is the minimum necessary to preserve the historic character and design of the structure.

2. An Exception shall not be issued within any designated floodway if any increase in flood levels during the base flood discharge would result.

3. An Exception shall only be issued upon a determination that the exception is the minimum necessary, considering the flood hazard, to afford relief.

4. An Exception shall only be issued upon:

    a) A showing of good and sufficient cause;

    b) A determination that failure to grant the exception would result in exceptional hardship to the applicant; and

    c) A determination that the granting of a exception will not result in increased flood heights, additional threats to public safety, extraordinary public expense, create nuisances, cause fraud on or victimization of the public, or conflict with existing local laws or ordinances.

5. An Exception may be issued for new construction and substantial improvements and for other development necessary for the conduct of a functionally dependent use provided that the above provisions of this Subsection C. are satisfied, and that the structure or other development is protected by methods that minimize flood damages during the base flood and create no additional threats to public safety.

**D. Conditions of approval.** Upon consideration of the factors in Subsection C., and the purposes of this Chapter, the Flood Plain Administrator may attach conditions to the granting of exceptions as it deems necessary to further the purposes of this Chapter.

**E. Notice to applicant.** An applicant to whom a Flood Standard Exception is granted shall be given written notice that the structure will be permitted to be built with a lowest floor elevation below the base flood elevation and that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced lowest floor elevation. A copy of the notice shall be recorded by the Flood Plain Administrator in the office of the Humboldt County Recorder.

**F. Records.** The Flood Plain Administrator shall maintain the records of all appeal actions, including justification for their issuance, and report any exceptions to the Federal Insurance Administration upon request.

**SEC. 8407. Appeal**

Any permit applicant, or permit holder affected by any decision of the Floodplain Administrator, may file with the City Manager a written request for reconsideration within 10 days of such decision, action, or determination, setting forth in detail the facts supporting the applicant's request for reconsideration. The City Manager shall make a final ruling on the appeal within 15 days of the close of the meeting.

If the ruling made by the City Manager is unsatisfactory to the person requesting reconsideration, he/she may within 10 days after notification of the City Manager's action, file a written appeal to the City Council. The written appeal shall be heard by the Council within 60 days from the date of filing. The City Manager's decision, action, or determination shall remain in effect during such period of reconsideration.

Section 3: Severability. If any section, subsection, sentence, clause or phrase of this chapter is for any reason held to be invalid or unconstitutional, the decision shall not affect the validity of the remaining portions of the Chapter. The City Council hereby declares that it would have passed this Chapter, and each section, subsection, sentence, clause and phrase thereof, irrespective of the fact that any one or more sections, subsections, sentences, clauses or phrases be declared invalid under law.

Section 4: This ordinance is exempt from the California Environmental Quality Act (CEQA) pursuant to Section 15061(b)(3) of the CEQA Guidelines, because it can be seen with certainty that there is no possibility that adoption of the ordinance may have a significant effect on the environment.

Section 5: The City Council finds that:

1. The Federal Emergency Management Agency (FEMA) has established the National Flood Insurance Program (NFIP) pursuant to the National Flood Insurance Act of 1968. The general purpose of the NFIP is both to offer primary flood insurance to properties with significant

flood risk, and to reduce flood risk through the application of local floodplain management standards.

2. Generally, local governments voluntarily participate in the NFIP to allow local property owners to have access to flood insurance. Participation requires the local government to adopt minimum floodplain standards. Participating communities that fail to maintain minimum floodplain standards can be put on probation or suspended from the NFIP, with the result that individuals cannot purchase NFIP flood insurance.

3. FEMA has revised its local flood insurance rate maps (FIRMs) establishing new minimum floodplain standards for NFIP participation effective November 4, 2016.

4. The City of Arcata's current floodplain standards will not meet the revised minimum standards required unless updated. In order for property owners to remain eligible for NFIP participation, the City must update its flood plain management standards through adoption of this Ordinance no later than November 4, 2016.

Based on the findings set forth herein, for the immediate preservation of the public peace, health or safety, this Ordinance shall go into effect and be in full force and operation upon its final passage and adoption, pursuant to Government Code Section 36937.

DATE: November 2, 2016

ATTEST: APPROVED:

/s/ Kara Newman
Deputy City Clerk, City of Arcata

/s/ Paul J. Pitino
Mayor, City of Arcata

**CLERK'S CERTIFICATE**

I hereby certify that the foregoing is a true and correct copy of Ordinance No. 1479 passed and adopted at a regular meeting of the City Council of the City of Arcata, County of Humboldt, State of California on the 2nd day of November, 2016, by the following vote:

AYES: **PITINO, ORNELAS, PEREIRA, WINKLER**

NOES: **NONE**

ABSENT: **WHEETLEY**

ABSTENTIONS: **NONE**

/s/ Kara Newman
Deputy City Clerk, City of Arcata

Chapter 1 - Executive Summary ..... 1-1

1.1 INTRODUCTION ..... 1-1
1.1.1 History of Facilities and Improvements ..... 1-2
1.2 PLAN DEVELOPMENT AND REVIEW PROCESS ..... 1-4
1.2.1 Public Process and Review ..... 1-5
1.3 PERMIT COMPLIANCE ..... 1-6
1.4 EXISTING FACILITIES OVERVIEW ..... 1-9
1.4.1 Hydraulic Capacity ..... 1-9
1.4.2 Process Capacity ..... 1-10
1.5 CONDITION ASSESSMENT ..... 1-11
1.6 PHILOSOPHY IN DEVELOPING ALTERNATIVES AND CIP ..... 1-12
1.6.1 Summary of Common Improvements Needed ..... 1-13
1.7 SECONDARY TREATMENT ALTERNATIVES ..... 1-16
1.7.1 Preliminary Screening of Secondary Treatment Options ..... 1-16
1.7.2 Project Alternative Development ..... 1-19
1.7.3 Alternative Comparison and Recommendation ..... 1-23
1.8 NEXT STEPS AND IMPLEMENTATION SCHEDULE ..... 1-25

Chapter 2 - Regulatory Requirements and Permit Compliance ..... 2-1

2.1 INTRODUCTION ..... 2-1
2.2 PURPOSE ..... 2-1
2.3 BACKGROUND ..... 2-2
2.4 PERMIT COMPLIANCE HISTORY ..... 2-3
2.4.1 2004-2015 Compliance Review and Permit Violations ..... 2-5
2.5 CURRENT PERMIT COMPLIANCE REQUIREMENTS ..... 2-8
2.5.1 Water Quality Standards ..... 2-8
2.5.2 Flow Reconfiguration Project ..... 2-9
2.6 FUTURE REGULATORY CONSIDERATIONS ..... 2-10
2.7 MEETINGS WITH NORTH COAST RWQCB ..... 2-12
2.8 NORTH COAST RWQCB REPORT OF WASTE DISCHARGE SUBMITTAL ..... 2-12

Chapter 3 - Flow and Load Evaluation ..... 3-1

3.1 INTRODUCTION ..... 3-1
3.2 EXISTING FACILITY DESIGN FLOW AND LOADS ..... 3-1
3.3 INFLUENT FLOW EVALUATION ..... 3-2
3.4 INFLUENT LOAD EVALUATION ..... 3-3

Chapter 4 - Existing Facilities and Capacity Evaluation ..... 4-1

4.1 INTRODUCTION ..... 4-1
4.2 FACILITY OVERVIEW ..... 4-1
4.3 EXISTING FACILITIES DESCRIPTION ..... 4-1
4.3.1 Headworks ..... 4-4
4.3.2 Primary Clarifiers ..... 4-4
4.3.3 Influent Bypass Pumping ..... 4-4
4.3.4 Oxidation Ponds and Pond Pumping ..... 4-4
4.3.5 Treatment Wetlands and Effluent Pumping ..... 4-5
4.3.6 Disinfection ..... 4-5
4.3.7 Enhancement Wetlands ..... 4-5
4.4 EXISTING HYDRAULIC CAPACITY SUMMARY ..... 4-6
4.4.1 Existing Hydraulic Profile ..... 4-6
4.4.2 Influent Pumping ..... 4-6
4.4.3 Headworks ..... 4-7
4.4.4 Primary Treatment ..... 4-7
4.4.5 Oxidation Ponds ..... 4-7
4.4.6 Treatment Wetlands ..... 4-8
4.4.7 Secondary Effluent Pumping ..... 4-8
4.4.8 Chlorine Contact Basin ..... 4-9
4.4.9 Enhancement Wetlands ..... 4-10
4.4.10 Hydraulic Capacity Summary ..... 4-10
4.5 NATURAL SYSTEM TREATMENT CAPACITY EVALUATION ..... 4-12
4.5.1 Process Capacity Background ..... 4-12
4.5.2 BOD Loading Criteria ..... 4-12
4.5.3 Secondary Treatment Capacity Shortfall ..... 4-14
4.6 KEY FINDINGS AND RECOMMENDATIONS ..... 4-18

Chapter 5 - Condition Assessment ..... 5-1

5.1 INTRODUCTION ..... 5-1
5.2 PURPOSE ..... 5-2
5.3 APPROACH ..... 5-2
5.3.1 Asset Inventory ..... 5-2
5.3.2 Replacement Timing ..... 5-2
5.4 VISUAL CONDITION ASSESSMENT RESULTS ..... 5-4
5.4.1 Headworks ..... 5-5
5.4.2 Primary Clarifiers ..... 5-7
5.4.3 Oxidation Ponds ..... 5-8

Chapter 1

# EXECUTIVE SUMMARY

## 1.1 INTRODUCTION

The Arcata Wastewater Treatment Facility (AWTF) is owned and operated by the City of Arcata (City), serving residents within the City limits and the unincorporated community of Glendale. The AWTF, shown in Figure 1.1, has been discharging to Humboldt Bay since about 1949. The AWTF currently discharges treated wastewater to Humboldt Bay in conjunction with enhanced treatment occurring in the Arcata Marsh Wildlife Sanctuary (AMWS), constructed freshwater wetlands adjacent to the treatment facility. Discharges are regulated by the North Coast Regional Water Quality Control Board (RWQCB) through application of National Pollutant Discharge Elimination System (NPDES) permit.

In 2012 the AWTF began operating under a new NPDES permit that specifically addressed several long-term issues regarding disinfection, treatment units, and outfalls. Due to past compliance problems, the new permit required changes be made to improve wastewater treatment, protect beneficial uses, increase energy efficiency, and reduce chemical usage, thereby reducing the potential for permit violations.

In response to the new permit requirements, the City initiated this Facility Plan and plant improvement project to address several issues:

- Ongoing NPDES permit violations and regulatory compliance.
- Need to repair or rehabilitate (R&R) aging infrastructure and address deferred maintenance.
- Providing reliable hydraulic and treatment capacity for both wet and dry weather flows now and in the future.

This facility plan provides overall direction for the current permit compliance project as well as a future Capital Improvements Program (CIP) needed to maintain the treatment facility assets, repair, and rehabilitate existing assets, and modernize the facility to meet current levels of service. This executive summary provides a brief overview of key findings and recommendations of the Facility Plan. For more detailed information, the reader is directed to the individual chapters of the Plan.

This facility plan was prepared by the LACO/Carollo Engineers team as part of the Wastewater Treatment Facility Improvements Project professional services.

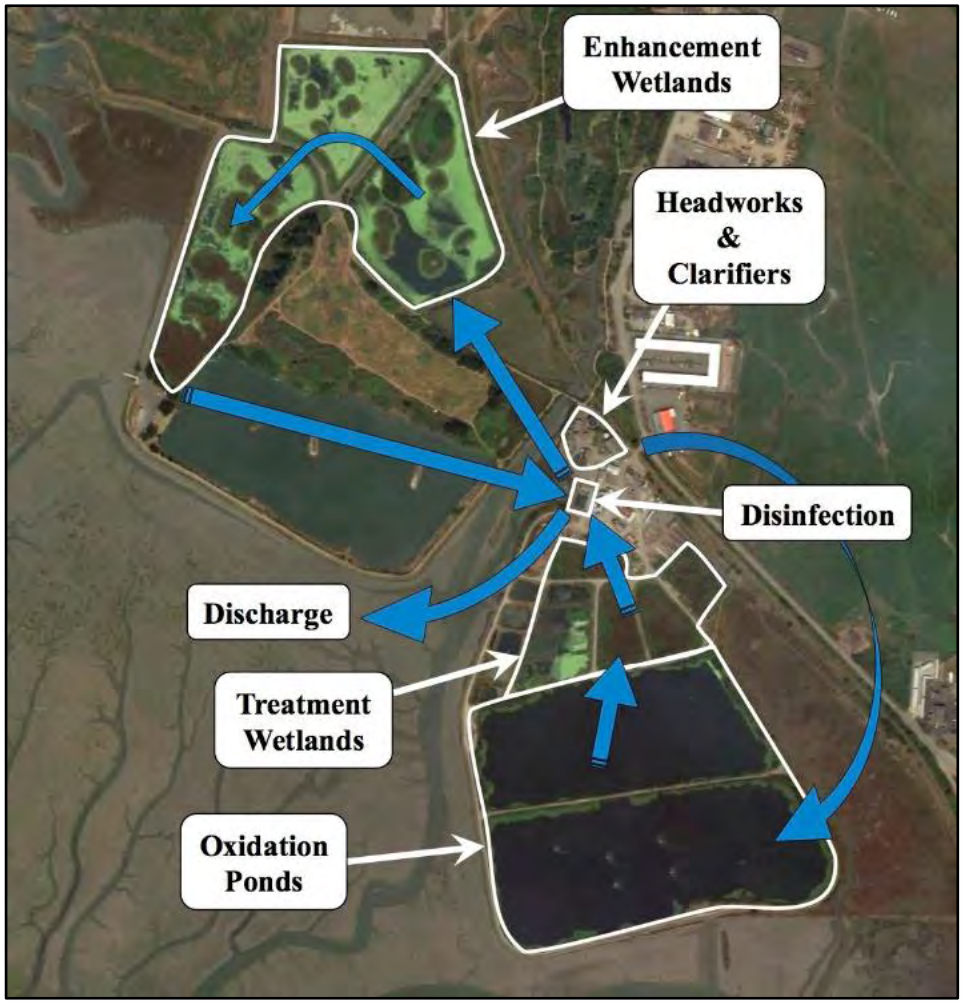

Figure 1.1 Existing AWTF Facilities

### 1.1.1 History of Facilities and Improvements

The original AWTF was constructed in the late 1950s. The AWTF has been upgraded throughout the years, with the last major upgrade project completed in the late 1980s. The project included a new headworks facility with screening and grit removal, a chlorine contact basin and chemical storage building, effluent pump stations and a new generator building. Since that project, smaller projects have included upgrades to the oxidation ponds, treatment and enhancement wetlands, digesters, pond aerators, chlorination/dechlorination system and the addition of a new standby generator. Generally the plant consists of these main elements:

- Influent pumps and preliminary treatment (screening and grit removal).
- Oxidation ponds, shown in Figure 1.2, and treatment wetlands that provide secondary treatment.

- Enhancement wetlands that provide polishing treatment in the AMWS.
- Chlorine contact basin that provides disinfection prior to discharge to Humboldt Bay.

Figure 1.2 AWTF Ponds Provide Secondary Treatment

The AWTF system relies heavily on land-based, natural treatment systems. This system has served the City well but has a number of drawbacks in that there is not sufficient room to further expand the natural treatment systems for additional capacity, and natural systems are inherently greatly affected by the weather (temperature and precipitation). As regulatory requirements have gotten more stringent over the years and with the initiation of mandatory minimum penalties in 2000, it has become more difficult to reliably meet permit compliance with the land-based natural system.

However, there is recognition that the facility as a whole, and the AMWS specifically, provides a tremendous community benefit. Not only do the residents of the area visit the marsh and its five miles of trails, but visitors come from far to see the wildlife that frequents the marsh. The Arcata Marsh Interpretative Center affords wetland and natural treatment educational opportunities for these visitors. Over 300 bird species have been observed using the marsh and it provides an important stop on the Pacific Flyway for migrating birds. A typical scene on a recreational trail is shown in Figure 1.3.

Figure 1.3 AMWS Provides a Significant Community Benefit

## 1.2 PLAN DEVELOPMENT AND REVIEW PROCESS

The City of Arcata, with its natural treatment system and the AMWS, are recognized as being leaders in sustainability and dedicated to being leaders in environmental progress. Established City Council goals that relate to this plan include (see 2015-16 Goals at http://www.cityofarcata.org/435/City-Council-Goals):

- Improving ***facilities and infrastructure*** to provide citizen safety and comfort.
- Providing ***environmental leadership*** to improve water resource management, increase local energy independence, strive towards zero waste and supporting ecosystem functions.
- Provide ***sustainable development*** by improving community services.
- Improve the quality of ***public services*** by improving communication with the public.
- Encourage ***citizen and community health*** by providing recreational opportunities, support essential human services, and encourage community participation.
- ***Prepare for future needs*** by providing leadership in developing adaption strategies for climate change and using best available science for future planning.

This Facility Plan strives to use these goals to help the City continue to provide wastewater services (an essential human service) in a safe manner that meets regulatory requirements and still provides the community benefits that is expected and loved.

To meet these goals for the facility plan as well as meeting Council goals, a triple bottom line approach of considering environmental, economic, and social impacts and benefits was established to use in considering alternatives and the overall direction of the plan. This is shown in Figure 1.4.

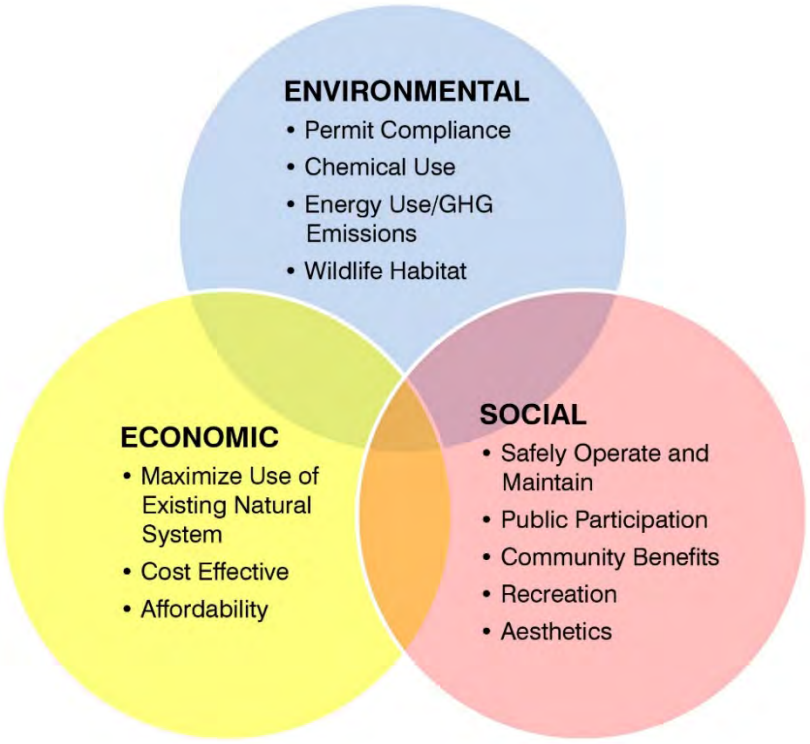

Figure 1.4 Triple Bottom Line Framework

### 1.2.1 Public Process and Review

Given the strong affiliation of the community and the college (Humboldt State University) with the AWTF and AMWS, it is critical that public input be provided into any proposed changes to the system. In order to get input, an Administrative Draft Facility Plan was presented to the City Staff and the Arcata Marsh Research Institute (AMRI) in September 2015. This original plan focused on needed repair and replacement, as well as permit compliance to replace the chlorination system with UV for the new outfall location in the brackish marsh. At this meeting, comments were received about concern over the process capacity being inadequate once chlorination was eliminated. At the time, process capacity was not in the scope of work. Following this input, the project team, along with the City and AMRI, did additional work and met in November 2015 to identify the capacity shortfall and alternatives to address this shortfall. Revised technical memorandums were distributed for City and AMRI review, and numerous conference calls were held to review technical work. In April 2016, a public workshop was held to present the findings and recommendations of the Draft Facility Plan, followed by a public Council Meeting on April 20th. At these meetings, significant discussion took place regarding the use of the existing natural system

and investing in improving it. This Facility Plan incorporates additional alternative evaluation and development to address many of these comments. The Facility Plan was presented on June 6 and June 13, 2016 at City Council Workshops.

Following the public meetings, City staff was able to meet with RWQCB staff June 27, 2016 to discuss the facility plan and the future NPDES permit. Based on feedback from the RWQCB, it was determined that the three alternatives identified in the draft facility plan would not completely meet the requirements of the RWQCB. Subsequently, City staff, AMRI and project team members met and developed a new alternative that would meet these requirements. The team proposed a new phased Alternative 4A/B in early 2017. The following steps were taken to arrive at a consensus alternative:

- The oxidation pond treatment improvements were reviewed and revised based on the review completed by an outside expert. The improvements were developed to improve the ponds systems ability to meet the anticipated discharge limits including the ability to remove ammonia.
- The City indicated a preference to phase in the parallel secondary treatment which will allow the benefits of the pond improvements to be incorporated into the sizing of the parallel secondary treatment improvements. A second oxidation ditch could be sized and constructed in a second phase, once the benefits of the oxidation pond upgrade were established.
- The flow schematic was updated to address the RWQCB requirements that all flows up to 5.9 mgd go through the enhancement wetlands based on the requirements of the Enclosed Bays and Estuaries Policy and to maintain existing and future treatment requirements.

This approach was reviewed during a public meeting on March 30, 2017 and a City Council meeting on April 19, 2017. The presentations from these meetings are included in Appendix V.

## 1.3 PERMIT COMPLIANCE

The AWTF must comply with regulatory requirements established by its NPDES permit. For this Facility Plan, the major regulatory requirements that affect the operation of the AWTF were reviewed along with the AWTF's compliance record. A summary of the permitting issues that affect the proposed Facility Plan is provided below:

- **Flow Reconfiguration.** The permit approves and now requires a new flow configuration and discharge point. With the new configuration, effluent flows will no longer discharge directly from the chlorine contact basin to Humboldt Bay through Outfall 001. Instead, disinfected enhancement wetlands effluent will discharge through the future Outfall 003, which will serve as the new point of compliance. Outfall 003 will be constructed in the brackish marsh at the north end of the Arcata

Bay section of Humboldt Bay. Permit compliance for the flow reconfiguration is required by December 1, 2016; the City plans to request for an extension.

- **Disinfection.** Since 2013 there have been approximately 21 violations of the permit for disinfection related incidents including disinfection by-products, chlorine residual, or adequate bacteria removal. The permit includes approval for construction of a new ultraviolet light (UV) disinfection system, in place of the existing chlorine disinfection system. UV-disinfected effluent will then discharge through the future Outfall 003. Permit compliance for UV disinfection is required by December 1, 2016; the City plans to request for an extension. Additional considerations for the new UV system include:
  - Implementation of UV disinfection (see Figure 1.5) would eliminate the disinfection by products; however, the existing natural treatment system has a very low UV transmittance, which impacts the sizing of the UV needed to meet disinfection requirements.

Figure 1.5 Proposed UV Disinfection

  - The existing use of chlorine provides chemical treatment of biochemical oxygen demand (BOD) and seasonal hydrogen sulfide. Eliminating use of the chlorine will result in a shortfall of BOD removal capacity by approximately 600 to 1000 pounds per day (ppd).

- **Wet Weather Flows.** The permit does not completely define flow reconfiguration for wet weather flows. It prohibits discharge of flows greater than 5.9 million gallons per day (mgd) through Outfall 003. Therefore, by default, the difference will either need to be stored in the oxidation ponds or discharged on an emergency basis through Outfall 001. At a meeting with the RWQCB on June 27, 2016 they indicated that bypasses were an issue. Additional consideration to this issue is required. The use of the oxidation ponds to intermittently store water during high wet weather flows has been incorporated into the plan.
- **Secondary Treatment.** Ongoing permit violations of plant effluent limits for BOD (at least 18 violations for Biochemical Oxygen Demand (BOD) in the last 2 years) and suspended solids (at least 20 violations for Total Suspended Solids (TSS) since 2013) indicate a need for additional secondary treatment capacity. This compliance history paired with the anticipated capacity shortfall after moving away from chlorine further supports the need for treatment beyond the capacity of the existing land-based natural system.
- **Dilution Credits.** The future Outfall 003 is currently being modelled to determine if dilution credits are justifiable for the new discharge point. If credits are allowed, the effluent toxicity testing should produce more favorable results.
- **Nutrients and Emerging Contaminants.** Nutrients such as nitrogen and phosphorus have been identified as potential issues. The North Coast RWQCB is currently reviewing limits for these constituents, and at the June 27, 2016 meeting with the RWQCB, it was made clear that the City would receive ammonia limits in its next NPDES permit in 2017. Other permittees in the North Coast Region (e.g., City of Ferndale and City of Eureka) have also received more restrictive limits for ammonia and nutrients in recent NPDES permit renewals. RWQCB staff indicated that the City of Eureka's June 2016 permit was a good example of likely limits for the AWTF.

  Constituents of Emerging Concern (CECs) include pharmaceuticals and personal care products, industrial chemicals present at low concentrations, and endocrine-disrupting chemicals. In general, these and other low-concentration contaminants have been identified as potential future issues for both effluent discharges and recycled water application. It was determined, however, that permitting around CECs would likely not take affect within the 20-year planning window for this Facility Plan.
- **Bacterial Quality of Humboldt Bay.** The bacterial quality of Humboldt Bay was noted as a particular concern in the RWQCB Water Quality Control Plan for the North Coast Region (Basin Plan) due to the location of several of California's most important commercial oyster farms in the northern lobe of the estuary known as Arcata Bay. The Basin Plan identifies stormwater runoff and point source discharges as having the greatest impact on water quality in Arcata Bay. The effluent limitations for fecal coliform bacteria for the new Outfall 003 were retained from the previous permit and reflect water quality objectives for protection of shellfish harvesting areas.

## 1.4 EXISTING FACILITIES OVERVIEW

The existing AWTF facilities include headworks, primary clarifiers, oxidation ponds, treatment wetlands, enhancement wetlands, and chlorine disinfection. Solids removed in the primary clarifiers are treated in anaerobic digesters and solids drying beds.

Evaluation of hydraulic and process capacity requires establishing design flow and loads. The design flows were based on the design flow. The loads were determined by using historical data sets and adding a 20 percent growth factor to the 90 percent percentile load to account for planned development under the General Plan. The City originally anticipated a 10 percent community growth which was incorporated into the Draft Facility Plan. After further discussion with the City at the Council meeting on June 13, 2016, community growth estimates have been revised to be 20 percent. Updates to incorporate this additional growth factor have been included in this Facility Plan to some extent, however, updates to sizing of the capacity projects and their cost estimates will be fully incorporated during preliminary design.

The design flows and loads are shown in Table 1.1.

**Table 1.1 AWTF Design Flow and Loads**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| | **Flow (mgd)** |
|---|---|
| Average Dry Weather Design Flow, mgd | 2.3 |
| Average Wet Weather Design Flow, mgd | 5.0 |
| Peak Wet Weather Design Flow, mgd | 5.9 |
| Peak Instantaneous Flow, mgd | 16.5 |
| Design Influent $BOD_5$ Load With 20% Growth, ppd | 4,800 |
| Design Influent TSS Load With 20% Growth, ppd | 6,910 |
| Design Influent Ammonia Load With 20% Growth, ppd | 1,060 |

### 1.4.1 Hydraulic Capacity

In general the existing hydraulic capacity of the plant is limited and needs to be modified to meet the permit requirements for the following elements:

- Influent pumps and headworks.
- Primary clarifiers.
- Treatment wetlands and treatment wetlands pumping.
- Enhancement wetlands and enhancement wetlands pumping.

The AWTF hydraulic capacity of unit processes is shown in Figure 1.6. Note that the wetlands capacity is based on pump stations rather than the wetlands, and therefore are

not rated on Figure 1.6. However, it has been noted that the treatment wetlands and enhancement wetlands perform best at steady, lower flows. For this reason, flows through the treatment and enhancement wetlands will be limited to 2.3 mgd. Hydraulic capacity upgrades including pump stations throughout the plant to provide a firm and reliable capacity up to the permitted wet weather flow of 5.9 mgd. During these peak wet flows, pond effluent is blended with wetland effluent prior to disinfection.

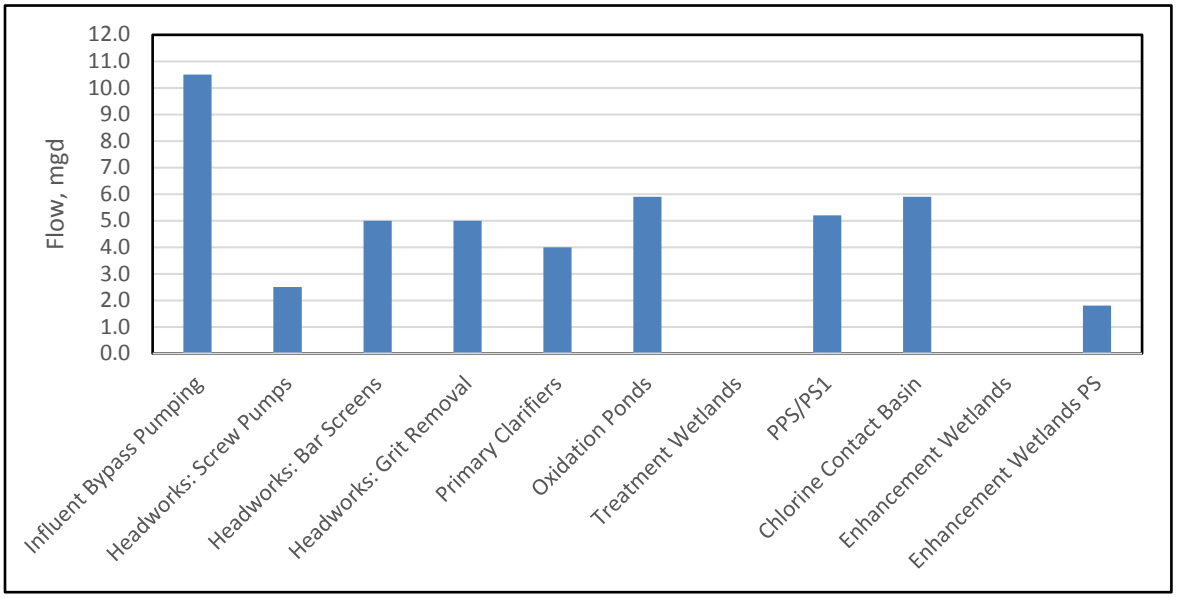

Figure 1.6 AWTF Hydraulic Capacity

### 1.4.2 Process Capacity

Using the design flow and loads presented in Table 1.1, a review of the existing facility process capacity found that secondary treatment capacity is limited for both BOD and ammonia removal. In the existing system, the oxidation ponds convert the organic load to solids and the wetlands remove the solids. These natural systems are impacted by loading, climate (including sunlight and temperature), and pond solids accumulation. Oxidation ponds, which utilize algae to provide oxygen, generally have a lower capacity to remove organics and nitrogen in the colder winter months when the amount of sunlight is limited.

Plant data confirmed that the natural system generally performed well during lower flow and warmer conditions. However, the treatment wetlands effluent regularly exceeded the permit solids level going into the AMWS enhancement wetlands, and subsequently into the chlorine contact basin prior to discharge. Plant data also showed that in higher flow, wet weather conditions, the system capacity, and permit requirements were exceeded regularly. When excess flow needs to be stored in the oxidation ponds, secondary treatment capacity within the ponds may also be diminished. In order to reduce the loading on the system and reliably meet the current permit requirements now and in the future, additional secondary treatment capacity will be required.

Using industry standards for allowable loading rates and removal rates, the capacity for BOD removal was determined for each process area, as shown in Table 1.2. The removal across each process can be added up for total removal expected. This total can be subtracted from the influent load to determine the capacity shortfall. Once the goal load for discharge is removed, the capacity shortfall is approximately 1,680 ppd of BOD as shown in Table 1.2. The allowable load for discharge is a little higher than the goal established for planning, however, the goal provides a factor of safety for reliable permit compliance.

**Table 1.2 BOD Capacity in Existing System**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| Process | BOD load removal, (ppd) | BOD load (ppd) remaining |
|---|---|---|
| Influent With 20% Growth | | 4,800 |
| Primary Clarifiers | 1,320 | 3,480 |
| Oxidation Ponds | 1,150 | 2,330 |
| Treatment Wetlands | 340 | 1,990 |
| Enhancement Wetlands | 120 | 1,870 |
| Disinfection | | none if UV |
| Discharge Goal at 10 mg/L | 190 | 1,680 |
| **BOD Capacity Shortfall** | | **1,680** |

This capacity shortfall sets the requirements for evaluating alternatives that could be used to improve or supplement treatment capacity.

## 1.5 CONDITION ASSESSMENT

As part of this Facility Plan, the AWTF facilities were evaluated for their overall condition. The purpose of the condition assessment is to document the existing facility conditions and help establish priorities for the City's wastewater treatment plant repair and rehabilitation (R&R) CIP. The findings from the condition assessment were incorporated into the CIP.

In May 2015 a condition assessment was performed to assess the current condition of existing structures and equipment and document observations made by plant staff. In general, the plant appears to have been maintained as much as the maintenance budget has allowed. However, findings from the assessment indicate that a majority of the mechanical equipment has exceeded its expected life, and that major structures are also starting to approach the end of their useful life. Finally, plant staff indicated that some capital and maintenance projects had been deferred, pending the outcome of this project.

That has meant that staff has struggled to meet permit limits and keep existing equipment operational, while normally it may have been replaced.

Figure 1.7 provides a summary of the overall condition assessment rankings by unit process. Any process with a ranking greater than 3 (fair) requires some attention and rehabilitation or replacement in the near future.

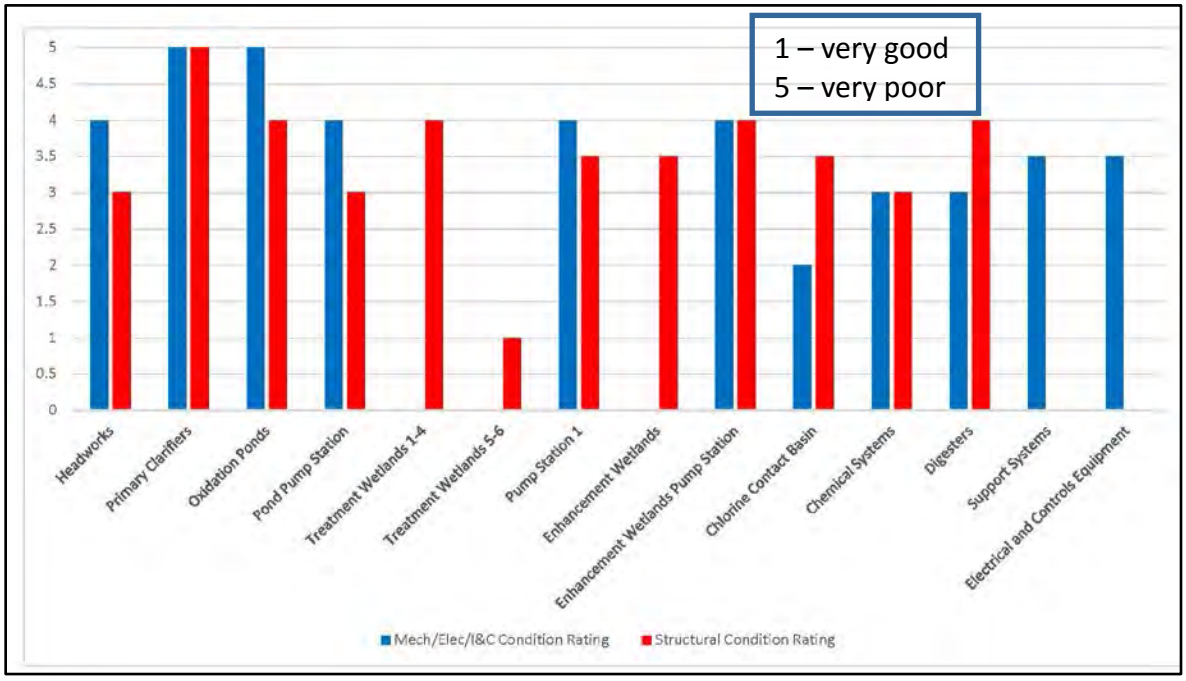

Figure 1.7 AWTF Facility Condition Rating

## 1.6 PHILOSOPHY IN DEVELOPING ALTERNATIVES AND CIP

Based on the findings of the existing facilities review of capacity and condition, paired with the need for permit compliance requires that the City develop a Capital Improvement Plan (CIP) to improve the system. This CIP must include a method to address the secondary capacity shortfall, which can be accomplished in a number of ways. The overall philosophy of the alternatives evaluation and CIP development can be summarized as follows:

- Achieve 100% Permit Compliance.
- Provide reliable capacity to meet current and General Plan future flow and loads.
- Maximize use of existing natural system.
- Address deferred maintenance.
- Address aging infrastructure.
- Provide optimal use of natural treatment system.

### 1.6.1 Summary of Common Improvements Needed

Based on the condition assessment and capacity evaluations, numerous facilities will need to be improved in the next ten years based on their expected useful life and current condition. In addition, there are many common elements needed for the new flow configuration.

#### 1.6.1.1 Permit Required Projects

The following common projects are required by the 2012 NPDES permit.

- **Outfall 003 and Flow Configuration**: The NPDES permit establishes a flow configuration to convert to a single pass disinfection system and discharge through a new outfall (Outfall 003) of 5.9 mgd. Piping, screening, pumps, and pump station modifications are required to switch to single pass flow through the system. The location of Outfall 003 is shown in Figure 1.8.

Figure 1.8 New and Existing Outfall Locations

- **UV Disinfection:** A new UV disinfection system will be constructed for disinfection of secondary effluent up to 5.9 mgd. The UV process will eliminate the disinfection by-product formation and permit violations that are occurring with the use of chlorine.

#### 1.6.1.2 Replace/Repair Aging Infrastructure

The following projects are needed to address aging infrastructure:

- **Headworks Improvements**: The recommended headworks improvement is to replace structural and mechanical assets due to age and condition, and to upsize the

capacity to handle design peak wet weather flow (PWWF) of 5.9 mgd. Replacing the headworks structure will also raise the hydraulic grade line at the start of the plant, allowing downstream facilities to flow by gravity and minimizing the need for additional pumping.

- **Primary Clarifiers**: The two primary clarifiers are currently rated at 4.0 mgd and 1.0 mgd each, and the visual condition assessment rated the average mechanical, electrical and I&C condition as very poor. The recommended improvement is to replace structural and mechanical assets due to age and condition. As part of this improvement the primary sludge and scum pumps would also be replaced.
- **Anaerobic Digesters and Sludge Heating/Mixing System**: The two anaerobic digesters are almost 60 years old. The external visual condition assessment rated the average structural condition as fair but the internal structural condition is unknown. The sludge heating and mixing system appears to be in good to fair condition. The recommended improvement is to improve structural and mechanical assets in phases.

#### 1.6.1.3 Address Deferred Maintenance and Maximize Existing Natural System

The following projects will restore the natural treatment processes:

- **Oxidation Pond Improvements**: Solids accumulation in the oxidation ponds is affecting treatment and hydraulic capacity. Between one to two feet of solids in each pond is anticipated needing dredging, dewatering, and disposal in order to return the ponds to original design intent. Reconfiguration of the pond transfer structures is recommended for better flow distribution and improvement of storage capacity.
- **Treatment Wetland Nos. 1 through 4 Solids and Vegetation Maintenance**: Solids accumulation and heavy vegetation growth in Treatment Wetland Nos. 1 through 4 is affecting treatment and hydraulic capacity. Some solids removal, regrading of the deep and shallow water zones, and vegetation replanting is anticipated in the four older treatment wetlands in order to return them to original design intent (Figure 1.9). No maintenance project is currently planned in Treatment Wetland Nos. 5 and 6 due to their recent construction.
- **Treatment Wetland 7**: Construction of new Treatment Wetland No. 7 is recommended. This project would convert an existing aquaculture pond into a new 2.3 acre treatment wetland, increasing the hydraulic capacity of the treatment wetlands from 1.8 mgd to 2.3 mgd. This project may require additional permitting requirements.

Figure 1.9 Treatment Wetlands will be improved

- **Enhancement Wetlands Improvements:** Solids accumulation and heavy vegetation growth in the enhancement wetlands is affecting treatment and hydraulic capacity. As Waters of the State, major regrading or any activities that significantly reduce water quality or habitat will not be allowed in the enhancement wetlands. Vegetation maintenance, new baffles, and new inlet/outlet structures will be completed in all three enhancement wetlands in order to improve treatment and hydraulic efficiency and capacity.

#### 1.6.1.4 Provide Reliable Capacity

The following projects address capacity limitations:

- **Pump Stations Improvements**: There are numerous pump stations that need replacement due to age and insufficient capacity. These include the emergency pond pump station, which should be modified for adding suction and discharge piping to allow the pump station to pump out of Pond 1 and into Pond 2 for Pond 1 storage control. Other pump station improvements included pond pump station and pump station 1, treatment wetlands No 4 pump station, treatment wetlands pump station 2 and the enhancement wetlands pump station.

- **Secondary Capacity Augmentation:** A secondary process capacity augmentation project is required to address the capacity shortfall of the existing processes, especially without the chemical treatment removal that occurs with the chlorination process that is being retired. The alternatives for this project are discussed in the next section.

## 1.7 SECONDARY TREATMENT ALTERNATIVES

Identification of secondary treatment options is needed to address the BOD capacity shortfall. This task was completed in phases. The first phase consists of a preliminary screening of new secondary treatment options to be used in conjunction with the existing natural system for pretreatment, parallel treatment, or post treatment. Any of these treatment options deemed feasible were further discussed and evaluated with the City.

### 1.7.1 Preliminary Screening of Secondary Treatment Options

There are several treatment processes that can be used to provide additional secondary treatment capacity, either alone or in combination with other processes, in order to achieve desired effluent water quality. Table 1.3 provides a list of secondary treatment processes that are commonly considered, along with the constituents they most commonly remove. Removal of ammonia and total nitrogen was considered for future flexibility in meeting ever increasingly stringent permit requirements. Based on the June 27, 2016 meeting with the RWQCB, it is expected that ammonia removal will be required in the 2017 NPDES permit.

**Table 1.3 Secondary Processes Meeting Permit Discharge Requirements Wastewater Treatment Facility Improvements Project City of Arcata**

| Process | Ability To Remove | | |
|---|---|---|---|
| | Organics (BOD)[1] | Ammonia[2] | Total Nitrogen[2] |
| **Suspended Growth** | | | |
| Activated Sludge (oxidation ditch) | √ | √ | √ |
| **Attached Growth** | | | |
| Trickling Filters | √ | | |
| Nitrifying Trickling Filters | | √ | |
| Denitrification Filters | | | √ |
| **Land Based Systems** | | | |
| Ponds (Aerated or Not) | √ | Summer only | |
| Vegetated Wetlands | √ | Limited | If nitrified before |
| Open water wetlands | √ | Some | If nitrified before |

Notes:
(1) Current permit discharge requirement.
(2) Anticipated future permit discharge requirement.

While there are variations of activated sludge processed such as Oxidation Ditch, Conventional Activated Sludge, Sequencing Batch Reactors, or a Membrane Bioreactor that adds a membrane filter, the biological treatment process is the same. Similarly, there are various attached growth processes that incorporate different types of media that the biological growth attaches to, but the treatment process is essentially the same.

In addition to the secondary processes presented above, there are some physical and chemical processes that could be considered. There are several approaches that could be taken with any additional treatment process: 1) pre-secondary treatment (pretreatment) by adding processes before the existing pond/wetlands system, 2) parallel secondary treatment, and 3) post-secondary treatment (post treatment, after the pond/wetlands). Each alternative considered needs to fit with a final UV disinfection step, as the City Council has affirmed several times the decision to move away from chlorine and instead use UV. Initial options that fall into each of these categories are shown in Table 1.4.

**Table 1.4 Initial Screening of Pre, Parallel and Post Treatment Options**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| | Treatment Option | Adds BOD capacity | Removes ammonia | Improves final UVT | Reliable | Move forward |
|---|---|---|---|---|---|---|
| **Pretreatment** | Chemically Enhanced Primary | < 400 ppd | No | No | Yes | No - high O&M cost |
| | Aeration | yes | limited | No | Yes | Yes |
| | Trickling Filter | yes | only if 2-stage | No | Yes | No |
| | Activated Sludge | Yes | Yes | No - TM degrades | Yes | No |
| **Parallel** | Additional Ponds/Wetlands | Yes | Summer only | No | Maybe | No - no room |
| | Rehabilitate Ponds/Wetlands | Yes - not enough | Summer only | No | Maybe | Yes |
| | Trickling Filter | Yes | only if 2-stage | No | Yes | Yes |
| | Activated Sludge | Yes | Yes | Yes | Yes | Yes |
| **Post Treatment** | Trickling Filter/Nitrifying Trickling filter | Yes | only if 2-stage | No | No - cold affects performance | No - not as flexible |
| | Submerged Biofilter | Not proven | Need to pilot | No | Unknown | No |
| | Ozone/Biological active Filtration | Yes | Maybe - must pilot | Not needed | Maybe - must pilot | No -Need to pilot |
| | Filtration | < 400 ppd | No | Maybe | Yes | No -Need to pilot |

Of the options considered, there are only a few that Carollo recommends carrying forward for a variety of reasons. Any process that requires piloting at the AWTF was eliminated to meet the accelerated schedule for permit compliance. Any process that is not yet a proven technology with full-scale installation experience was also eliminated early in the alternatives analysis. Several processes would not provide enough capacity (such as chemically enhanced primary treatment and filtration. Attached growth processes were considered less reliable and less flexible for meeting future ammonia and nutrient removal requirements. In addition, attached growth processes do not improve UV transmittance

(UVT), which makes UV disinfection more expensive. Additional pond and wetland processes require additional land and no land is available.

The options carried forward are:

- The viable pretreatment alternative to be further considered is aeration in Pond 2.
- The viable parallel treatment alternatives to be further considered are rehabilitation of the ponds/wetlands, trickling filters, and activated sludge.
- None of the post treatment alternatives will be further considered.

At the November 5 and 6, 2015 facility plan capacity workshop with the City staff and City consultant Bob Gearheart (with AMRI), a more detailed analysis of parallel secondary treatment options was discussed, including:

- Conventional activated sludge (CAS) aeration basins.
- Extended aeration activated sludge (oxidation ditch).
- Trickling filters.
- Modifying existing oxidation ponds to a Biolac system or aerated lagoons.

As discussed at the workshop, modifying the existing oxidation ponds to a Biolac system or aerated lagoons was deemed not feasible due to constructability issues with the berms and pond depths. During the November 2015 workshop, discussion of the treatment options included a number of considerations including performance, footprint, constructability, operation and maintenance requirements, and economic factors. A summary of the non-economic evaluation is outlined in Table 1.5. A summary of the economic evaluation is outlined in Table 1.6.

**Table 1.5 Secondary Treatment Options Evaluation of Non-Economic Factors**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| Option | Criteria Scale: 1 (least favorable) to 3 (most favorable) | | | | | |
|---|---|---|---|---|---|---|
| | **Safety** | **Meets Permit** | **Ease of O&M** | **Construct -ability** | **Reliability** | **Ammonia Removal** |
| Conventional Activated Sludge | 2 | 3 | 1 | 3 | 3 | 2 |
| Extended Aeration – Oxidation Ditch | 2 | 3 | 3 | 2 | 3 | 3 |
| Trickling Filters | 3 | 1 | 3 | 2 | 1 | 1 |

| Table 1.6 Secondary Treatment Options Evaluation of Economic Factors<br>Wastewater Treatment Facility Improvements Project<br>City of Arcata | | | | | | |
|---|---|---|---|---|---|---|
| | Criteria Scale: 1 (least favorable) to 3 (most favorable) | | | | | |
| Option | Construction Cost | Footprint | Operator Attention | Power Cost | Sludge Production | Maintenance Requirement |
| Conventional Activated Sludge | 3 | 3 | 1 | 1 | 1 | 1 |
| Extended Aeration – Oxidation Ditch | 2 | 1 | 2 | 2 | 2 | 3 |
| Trickling Filters | 1 | 2 | 3 | 3 | 3 | 2 |

Given the need to identify a system that is simple to operate, low maintenance and yet provides high reliability in meeting a high quality effluent, the preferred alternative was an extended aeration oxidation ditch process, shown in Figure 1.10. Compared to the oxidation ditch, conventional activated sludge requires greater operator attention and complexity; trickling filters do not provide as much reliability for treatment nor flexibility for future regulations; oxidation pond modifications have a greater risk of permit violations during long-term operation and do not allow for storage of peak wet weather flows in Pond 1.

Figure 1.10 Example of Proposed Oxidation Ditch Secondary Treatment

## 1.7.2 Project Alternative Development

The viable options identified in the screening process were further refined as project alternatives that address how the facility would perform as a system. Project alternatives consider facility-specific issues such as flow routing, hydraulic and treatment capacity of individual processes, and process improvement or replacement needs based on condition assessment. The goal of each project alternative is to provide a facility that maximizes use of the existing natural system while meeting treatment and permit compliance objectives.

Based on the findings of the preliminary and secondary screening as well as feedback received at presentations made to City Staff, the public and City Council in April 2016, three project alternatives were developed.

### 1.7.2.1 Alternative 1 - Existing System Rehabilitation

This alternative improves the existing natural treatment system with no supplemental secondary treatment process. This alternative does not provide the required capacity to meet the BOD capacity shortfall. In the past the shortfall was made up by use of chlorine for supplemental BOD removal. This alternative will not provide year-round nitrification removal, and therefore will not be able to meet the anticipated monthly average ammonia requirements. This alternative was conceptualized by AMRI and further evaluated by Carollo to meet treatment and permit compliance objectives. Pond solids would be removed, the treatment wetlands would be improved, and Treatment Wetlands No. 7 would be constructed. Aeration would be added to the ponds to provide some supplemental capacity, but a 1000 ppd BOD removal deficiency at 20 percent growth projection is still anticipated. Based on the feedback from the June 2016 meeting with the RWQCB, this alternative is no longer considered viable. The Alternative 1 flow schematic is shown in Figure 1.11.

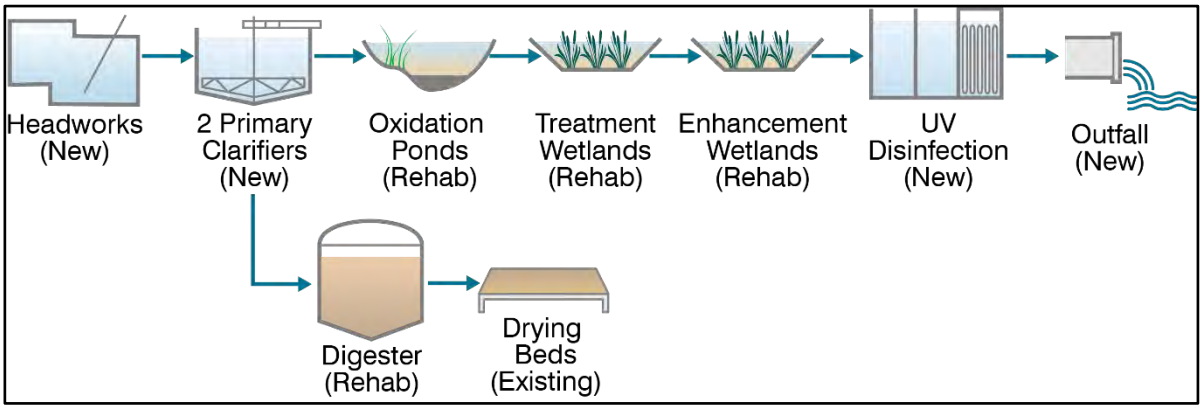

Figure 1.11 Alternative 1 - Existing System Rehabilitation

### 1.7.2.2 Alternative 2 - Existing System with Side-Stream Treatment

This alternative provides a side-stream secondary treatment process parallel to the ponds and treatment wetlands that returns flow upstream of the enhancement wetlands. The ponds and treatment wetlands would continue treating the majority of the plant influent flow and would be improved, just as in Alternative 1. The side-stream treatment process would treat a portion of the plant influent flow as needed for supplemental BOD and year-round partial nitrification treatment capacity. An oxidation ditch is the planned side-stream treatment technology and would be operated at approximately 0.5 mgd during dry weather and able to handle additional flows during wet weather or during periods of pond turnover. Both effluents would normally blend before passing through the enhancement wetlands and UV disinfection. Based on the feedback from the June 2016 meeting with the RWQCB, this

alternative is no longer considered viable. The Alternative 2 flow schematic is shown in Figure 1.12.

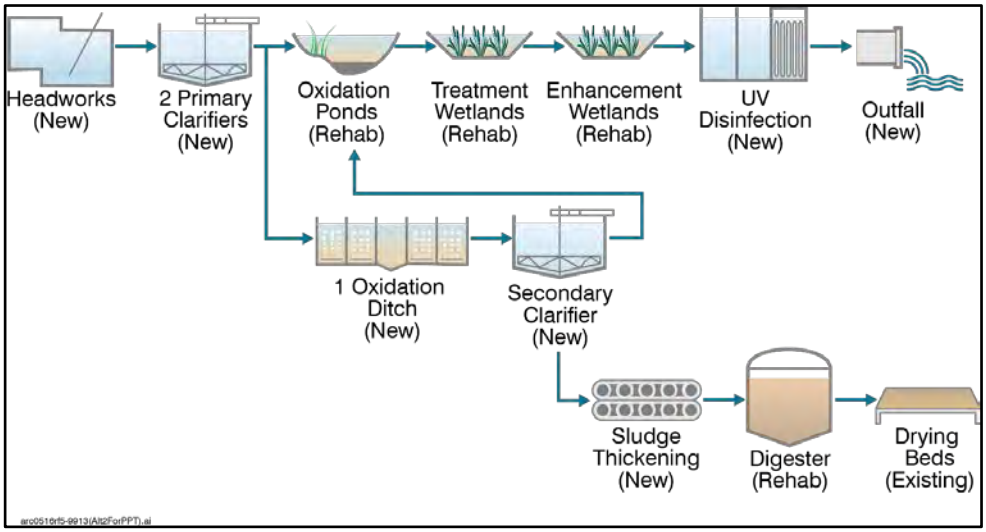

Figure 1.12 Alternative 2 - Existing System with Side Stream Treatment

### 1.7.2.3 Alternative 3 - Existing System with Parallel Treatment

This alternative provides a parallel secondary treatment process to the ponds, treatment wetlands, and enhancement wetlands. The natural system train and parallel process train would each treat a portion of the plant influent flow at variable percentages to provide a blended effluent meeting treatment objectives. The natural system would continue treating the majority of the plant influent flow up to available hydraulic and treatment capacity and would be improved, just as in Alternative 1 with the exception of the pond aerators, which are not necessary. The parallel process train, currently planned as oxidation ditches followed by secondary clarifiers, would provide BOD and year-round full nitrification treatment capacity to handle the remainder of the hydraulic capacity needs and to meet specific blended water quality requirements. The parallel process would be sized to turn down to 0.5 mgd in dry weather and be able to handle up to 4.1 mgd of wet weather flow. Natural system effluent and parallel process effluent would combine prior to UV disinfection. The higher quality water (higher UVT) produced by the oxidation ditch system and blended with the natural treatment system allows the UV disinfection system to be downsized. Based on the feedback from the June 2016 meeting with the RWQCB, this alternative is no longer considered viable. The Alternative 3 flow schematic is shown in Figure 1.13.

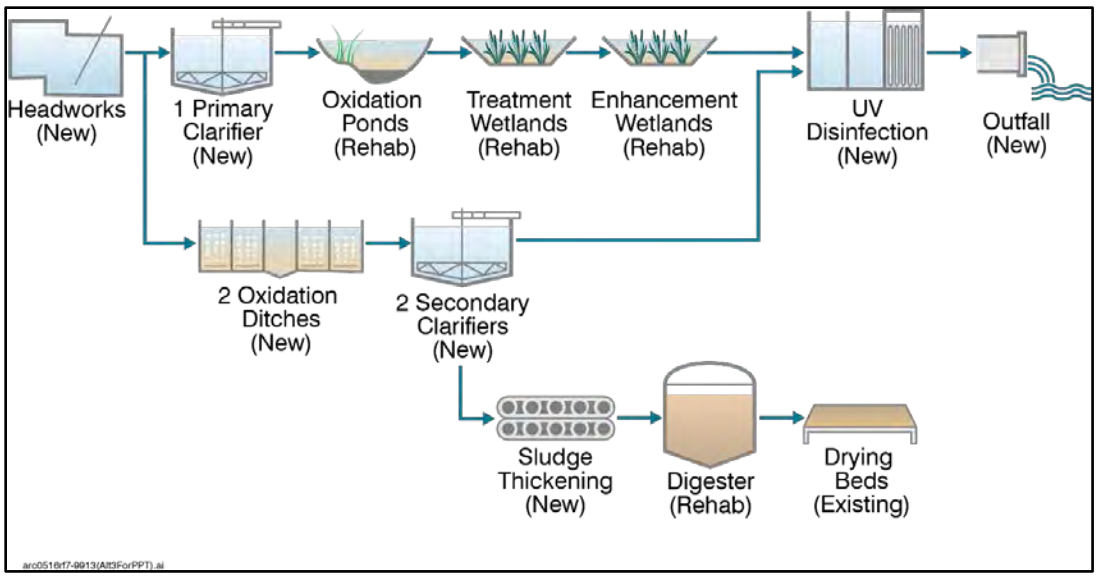

Figure 1.13 Alternative 3 - Existing System with Parallel Treatment

### 1.7.2.4 Alternative 4 – Enhanced Natural System with Parallel Treatment

As noted above, a new alternative 4 was developed to address the upcoming nutrient removal requirements, and the need for plant effluent flows to be routed through the enhancement wetlands. This alternative provides both an upgrade to the existing pond / wetland treatment system and a parallel secondary treatment process. The natural system train and parallel process train would each treat a portion of the plant influent flow at variable percentages to provide a blended effluent meeting treatment objectives. The natural system would continue treating the majority of the plant influent flow up to available hydraulic and treatment capacity. The parallel process train, currently planned as oxidation ditches followed by secondary clarifiers, would provide BOD and year-round full nitrification treatment capacity to handle the remainder of the hydraulic capacity needs and to meet specific blended water quality requirements. Natural system effluent and parallel process effluent would be combined prior to UV disinfection and discharge through the enhancement wetlands to the new brackish marsh outfall. The Alternative 4 flow schematic is shown in Figure 1.14.

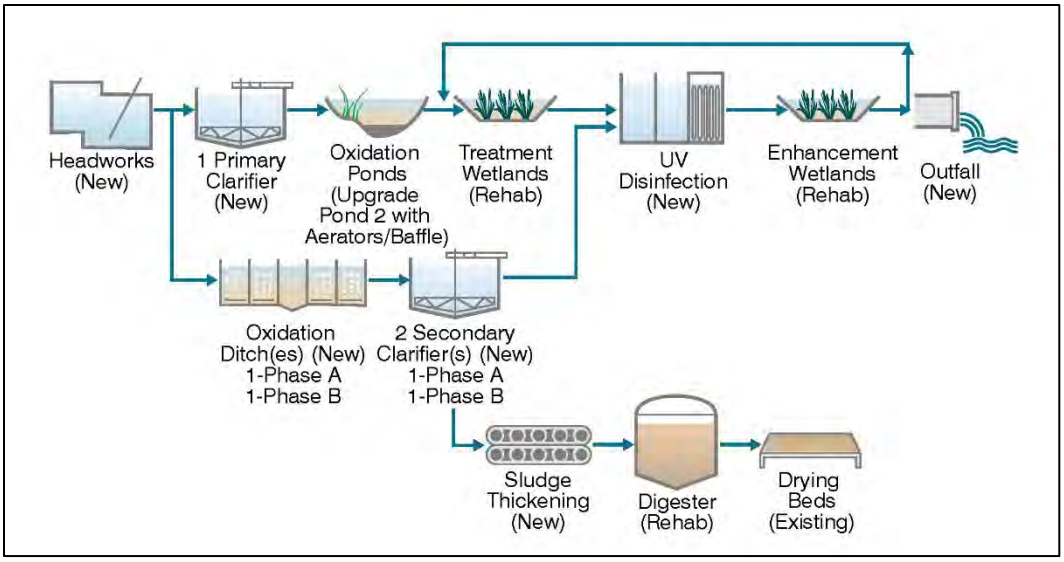

Figure 1.14 Alternative 4 - Enhanced Natural System with Parallel Treatment

### 1.7.3 Alternative Comparison and Recommendation

A comparison of the alternatives using non-economic factors is summarized in Table 1.7.

**Table 1.7 Summary of Alternative Comparison for Non-Economic Factors**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| Alternative | Criteria Scale: 1 (least favorable) to 4 (most favorable) | | | | |
|---|---|---|---|---|---|
| | Meets Permit | Ease of O&M | Construct-ability | Reliability | Ammonia Removal |
| 1. Existing System Rehabilitation | 1 | 4 | 1 | 1 | 1 |
| 2. Existing System with Side-stream Treatment | 2 | 1 | 2 | 2 | 2 |
| 3. Existing System with Parallel Treatment | 3 | 3 | 3 | 4 | 4 |
| 4 Enhanced natural system with parallel treatment | 4 | 2 | 4 | 3 | 3 |

The alternatives are also compared based on economic criteria (project cost, operation and maintenance cost, and overall lifecycle cost) as shown in Table 1.8. Costs presented in this Facility Plan are project costs and include construction, engineering, legal, administrative, and permitting costs, as well as estimating contingencies. The costs are presented in 2016 dollars and are based on a San Francisco Engineering News Record Construction Cost Index. Costs are not escalated to future years. Cost estimates presented in the Draft Facility Plan were developed based on 10 percent community growth that was originally anticipated by the City. Cost estimate updates to reflect the 20 percent growth projection are shown with an additional 10 percent of the original secondary and solids costs.

Alternative 4, Enhanced natural system with a parallel secondary treatment process, provides the highest rankings for permit compliance, and constructability. It is ranked second with respect to reliability and future compliance with ammonia removal (which may also help reduce effluent toxicity), only due to the reliance on the existing oxidation pond upgrades. Alternative 4 is anticipated to meet the requirements of the Enclosed Bays and Estuaries Policy by treating the full flow to 5.9 mgd through the enhancement wetland. This alternative is anticipated to have the highest capital cost and nearly the highest operation costs. This alternative would eventually require the largest footprint in the treatment plant, although the second oxidation ditch might be smaller if the pond improvements are successful.

**Table 1.8 Cost Comparison of Treatment Alternatives**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| Alt. | Description | Total Project Cost With 10% Growth(1) | Total Project Cost With 20% Growth(1,4) | O&M Cost | | Lifecycle Cost(3,4) |
|---|---|---|---|---|---|---|
| | | | | Annual(2) | Present Worth(3) | |
| 1 | Existing System Rehabilitation | $35.1 | $35.2 | $0.67 | $5.7 | $40.9 |
| 2 | Existing System Rehabilitation with Side-stream Treatment | $44.7 | $45.7 | $0.75 | $6.4 | $52.1 |
| 3 | Existing System Rehabilitation with Parallel Treatment | $43.8 | $45.5 | $0.43 | $3.7 | $49.2 |
| 4 | Enhanced natural system with parallel treatment | -- | $52.4 | $0.78 | $13.6 | $66.1 |

Notes:
(1) Costs are based on 2016 dollars, in millions, using SFENR construction cost index.
(2) Annual O&M costs include only differential O&M costs, and do not include O&M costs which are common to all alternatives (such as influent pumping).
(3) Lifecycle cost is total project cost plus present worth value of annual O&M costs. Annual O&M costs were converted to present worth value based on 3 percent inflation rate, 6 percent discount rate, and 10-year analysis period.
(4) Estimated total project cost and lifecycle cost is updated with additional anticipated growth subsequent to the June 13, 2016 Council meeting. Additional cost for 20% growth projection based on adding 10% to secondary and solids costs.

Alternative 3, rehabilitation of the existing natural system with a parallel secondary treatment process, provides highest ranking with respect to ammonia removal (which may also help reduce effluent toxicity), and the second highest rankings for permit compliance, operations and maintenance, constructability, and reliability. Alternative 3 is anticipated to meet current permit requirements for enhancement through advanced secondary treatment with nitrification, providing full BOD treatment capacity without disinfection byproduct violations, as well as meeting future ammonia permit limits year-round. It appears it will not meet all permit requirements, because it does not meet the requirements of the Enclosed Bays and Estuaries Policy. This alternative is anticipated to be lower in capital cost than

Alternative 2 or 4 as some project elements can be eliminated or decreased. This alternative is anticipated to require the largest footprint in the treatment plant.

Alternative 1, rehabilitation of the existing natural system, fairs poorly because the BOD treatment capacity is limited in the existing natural system and therefore creates risk for permit violations. Additionally, during construction of the improvements to Alternative 1, there is a higher risk of violations due to additional stress on an already under-capacity system. Project elements to increase BOD treatment capacity include sludge removal in Ponds 1 and 2, adding aerators to Pond 2, and construction of Treatment Wetland No. 7; however, even with these improvements there will be a BOD treatment capacity shortfall with the elimination of chlorine. This would result in permit violations and mandatory minimum penalties. Increasing the growth projection from 10 to 20 percent increases the BOD treatment capacity shortfall, which will be difficult to address in Alternative 1 without an additional secondary treatment process. Furthermore, future ammonia permit limits may not be met year-round with Alternative 1 without an additional nitrification process. Per discussions with the RWQCB, effluent discharge bypassing enhancement is a violation of permit requirements. Alternative 1 currently requires up to 3.6 mgd to bypass the Enhancement Wetlands due to capacity limitations, which does not meet permit objectives.

In Alternative 2, the BOD treatment capacity shortfall would be supplemented by the side-stream secondary treatment process of one oxidation ditch and one secondary clarifier. Increasing the growth projection from 10 to 20 percent increases the BOD treatment capacity shortfall, which could be addressed in Alternative 2 by increasing capacity in the oxidation ditch, or adding a second unit. Alternative 2 also does not meet current permit requirements for enhancement In addition, this alternative is anticipated to have slightly higher capital cost as it requires the most project elements.

Based on these comparisons, both economic and non-economic, Carollo and LACO recommend proceeding with preliminary design of Alternative 4 with options to phase the implementation.

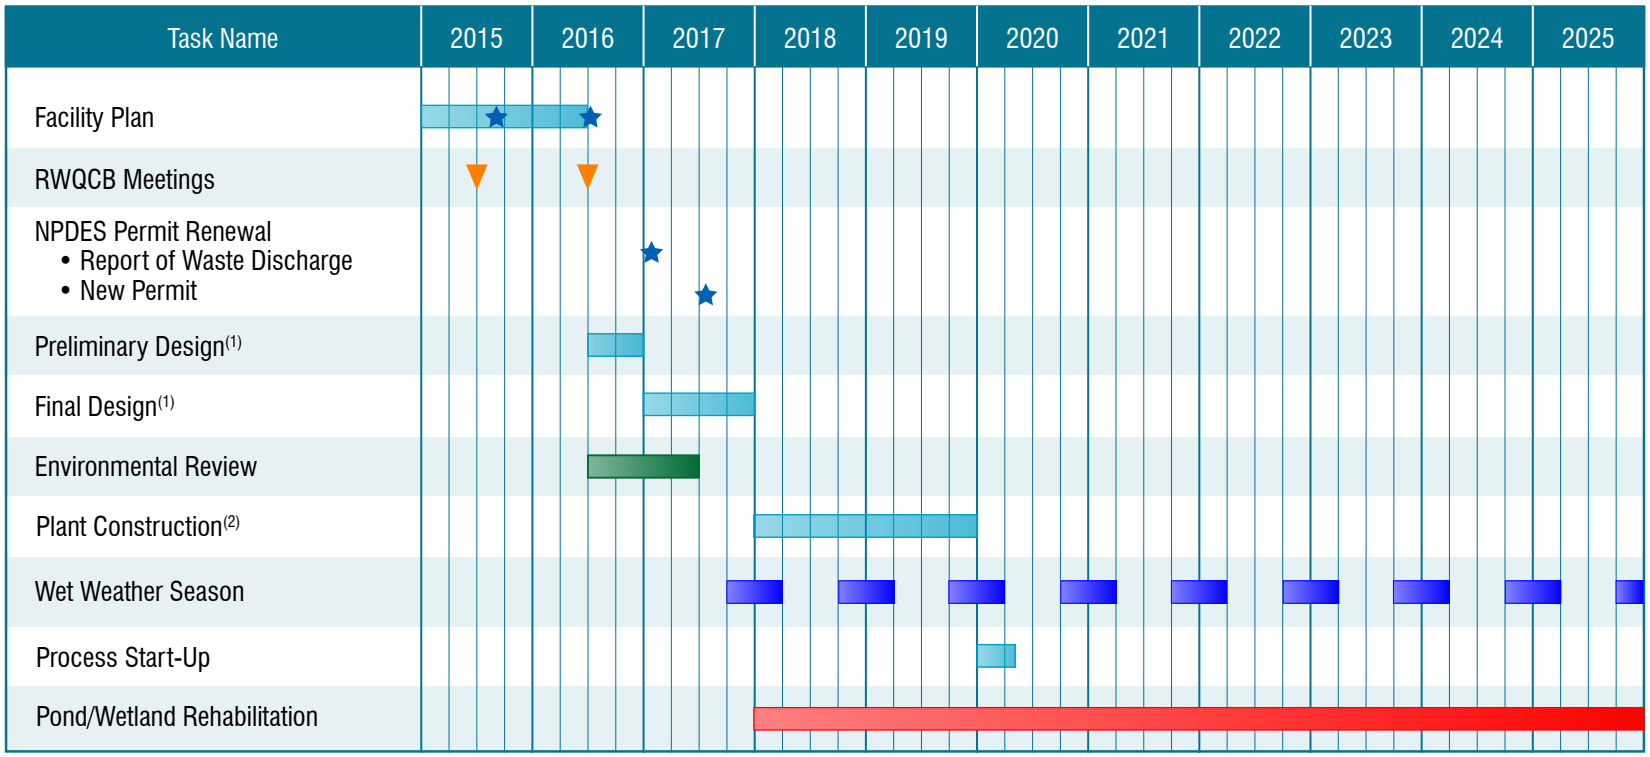
## 1.8 NEXT STEPS AND IMPLEMENTATION SCHEDULE

The AWTF will undergo a number of changes over the next 20 years in order to both meet permit requirements and address the ongoing needs of maintaining this vital City asset. The recommended project as outlined above will meet permit requirements, address R&R needs, and address capacity for the AWTF including the following:

- Preliminary and final design
- A Report of Waste Discharge was submitted to the RWQCB in January 2017 to start permit renewal. A new NPDES permit is expected in 2017.
- Environmental review and permitting.
- Funding Application Process for State Revolving Fund program for loans and grants.

- Bidding and award.
- Construction and start up.

A preliminary implementation schedule is shown in Figure 1.15. The schedule has been extended to account for the need to get the current facility plan approved, and then complete preliminary and final design. Construction (of the majority of the mechanical and structural elements) is shown in 2019 through 2021, with final commissioning and startup in late 2021. The construction will cover the dry weather periods of both 2019/2020 and 2020/2021, and should allow for all the work to be completed while maintaining the existing plant in operation. Wet weather periods are also shown in the schedule as construction during these periods is difficult. The Pond and Wetlands rehabilitation is shown as a separate line item as these projects may be performed by City staff as opposed to a contractor and due to the extended construction time expected. The wetlands in particular will take longer to rehabilitate due to the need to regrade during dry season, plant and let the plants get established (approximately a 2 year cycle before performing as expected).



NOTES:

(1) To be finalized after completion of the Facility Plan.

(2) Construction schedule is preliminary, constraints TBD.

# UPDATED IMPLEMENTATION SCHEDULE

FIGURE 1.15

CITY OF ARCATA

*WASTEWATER TREATMENT PLANT IMPROVEMENTS PROJECT*

carollo

# REGULATORY REQUIREMENTS AND PERMIT COMPLIANCE

## 2.1 INTRODUCTION

The City of Arcata (City) owns the wastewater collection, treatment, and disposal facilities that serve approximately 16,800 residents, including 8,000 students, in the service area (City and the unincorporated community of Glendale). The Arcata Wastewater Treatment Facility (AWTF) is located at 600 South G Street in Arcata, Humboldt County, California. The AWTF in its varying forms has been discharging to Humboldt Bay since about 1949. The AWTF currently discharges treated wastewater to Humboldt Bay in conjunction with enhanced treatment occurring in the Arcata Marsh Wildlife Sanctuary (AMWS), which are constructed freshwater wetlands adjacent to the treatment facility.

The AWTF is recognized around the world for providing sustainable treatment with community and environmental benefits. Within the City's sustainability goals and initiatives that impact environmental, economic, and social realms ("triple bottom line"), National Pollutant Discharge Elimination System (NPDES) permit compliance is at the core of each category. Permit compliance protects the environment, reduces economic risk from violation penalties, and promotes a safe community.

The AWTF provides primary and secondary treatment followed by disinfection. Primary treatment facilities include influent pumping, mechanical bar screens, grit removal, and primary clarifiers. Primary solids are sent to anaerobic digesters, sludge drying beds, and sludge composting. Secondary treatment is accomplished through two oxidation ponds in series, followed by six treatment marshes operating in parallel. Currently, secondary effluent is disinfected with chlorine gas and dechlorinated with sulfur dioxide prior to discharge. Under the existing flow configuration, for about 9 months every year, a portion of the treated effluent is sent to the AMWS for enhanced treatment while the remainder is discharged to Humboldt Bay via Outfall 001. Effluent out of the AMWS is returned to the chlorine contact basin for a second step of disinfection and dechlorination. The result is disinfected secondary effluent that does not receive all the enhancement benefits of the AMWS and is chlorinated multiple times, increasing the opportunity for formation of disinfection byproducts above water quality objectives.

## 2.2 PURPOSE

The purpose of this chapter is to:

- Discuss compliance history of the AWTF leading up to the current NPDES permit, including review of available compliance data in the last three years to identify current permit issues.
- Review the current NPDES permit compliance requirements.

- Discuss potential future permit requirements in the State and for Humboldt Bay dischargers.

## 2.3 BACKGROUND

Adopted on May 16, 1974, Resolution No. 74-43, known as the Enclosed Bays and Estuaries Policy, prohibits the discharge of municipal wastewater and industrial process water to enclosed bays and estuaries “unless the discharge enhances the quality of the receiving water above that which would occur in the absence of the discharge.” The Enclosed Bays and Estuaries Policy enhancement criteria is defined as, "…(1) Full uninterrupted protection of all beneficial uses which could be made of the receiving water body in the absence of all point source discharge(s) along with (2) a demonstration by the applicant that the discharge, through the creation of new beneficial uses or fuller realization, enhances water quality for those beneficial uses which could be made of the receiving water in the absence of all point source discharges..."

In 1983, the Regional Water Board adopted Resolution No. 83-9, granting the City of Arcata a waiver, as defined in Chapter I, Paragraph A of the Bays and Estuaries Policy, permitting continued [Humboldt] Bay discharge. Resolution No. 83-9 found that the marsh disposal alternative meets the definition of enhancement set forth in State Board Order No. 79-20 because the waste would achieve secondary treatment standards, create no adverse impacts to present beneficial uses and the discharge would create new beneficial uses and wildlife habitat. As a result, the AMWS is an integral part of the AWTF and a valued part of the Arcata community providing numerous non-contact recreation and educational opportunities.

In 2012, the AWTF began operating under a new National Pollutant Discharge Elimination System (NPDES) permit that specifically addressed several long-term issues regarding disinfection, treatment units, and outfalls. The new permit enabled changes to be made to improve wastewater treatment, protect beneficial uses, increase energy efficiency, reduce chemical usage, and reduce the potential for permit violations. The NPDES Permit (No. CA0022713) and Waste Discharge Requirements Order (No. R1-2012-0031) were issued by the North Coast Regional Water Quality Control Board (RWQCB), and became effective on August 1, 2012. The permit was subsequently modified in 2015. The permit will be up for renewal on August 1, 2017.

The permit approves a new flow configuration and discharge point. Effluent flows will no longer discharge directly to Humboldt Bay (Outfall 001), but will be discharged after enhanced treatment in the AMWS. The new point of compliance and outfall (Outfall 003) will be to the brackish marsh adjacent to the AMWS, which discharges into a slough at the

north end of the Arcata Bay portion of Humboldt Bay. The permit also includes approval of a new disinfection process using ultraviolet light (UV) disinfection facilities prior to Outfall 003. Until the improvements are complete, the AWTF is operating under interim effluent limits for discharge to Outfall 001, which are essentially the same as the final compliance requirements for Outfall 003. Discharge requirements for the intermediate discharge point to the AMWS (Outfall 002) are also noted in the permit. The location of the facilities and outfalls are shown in Figure 2.1. The major water quality standards established in the NPDES permit are shown in Table 2.1. The NPDES/WDR permit is included in Appendix A for a complete list of required standards.

## 2.4 PERMIT COMPLIANCE HISTORY

Since the original plant design, the regulatory climate and enforcement world has significantly changed. Mandatory minimum penalties were implemented by the State Water Resources Control Board (SWRCB) in 1999, and began to be enforced in 2006. Today, the

regulatory climate is increasingly stringent. Occasional permit non-compliance is no longer acceptable to the SWRCB, environmental conservation groups, or the general public.

The mission of the SWRCB is:

> ***To preserve, enhance, and restore the quality of California's water resources and drinking water for the protection of the environment, public health, and all beneficial uses, and to ensure proper water resource allocation and efficient use, for the benefit of present and future generations.***

The SWRCB and the nine RWQCBs are charged with protecting water quality. Doing so requires regular updates to regulatory requirements based on the latest research and data. As a result, NPDES permits are consistently getting more stringent over time.

### 2.4.1 2004-2015 Compliance Review and Permit Violations

A review of available information from 2004 to 2015 was conducted to understand the history of permit compliance and permit violations at the AWTF.

Based on review of the 2012 permit and input from the City, a history of permit violations from 2004 to 2011 are summarized:

- On June 12, 2008, the North Coast RWQCB issued Administrative Civil Liability (ACL) Order No. R1-2008-0048 to the Permittee assessing a civil liability of $104,000 for violations of Order No. R1-2004-0036 for the period from June 22, 2004, to March 31, 2007. Most violations of waste discharge requirements in this time period were related to discharges of biochemical oxygen demand (BOD), total suspended solids (TSS), percent removal, coliform bacteria, copper, and cyanide, and for sewer system overflows. A portion of the liability is being held in abeyance pending resolution of legal matters, a portion has been paid to the State Water Pollution Cleanup and Abatement Account, and a portion was suspended pending satisfactory completion of a Supplemental Environmental Project and two collection system projects proposed by the Permittee.
- On May 19, 2010, an ACL Compliant was issued to the Permittee for five sanitary sewer overflows and copper effluent violations. ACL sought for the alleged violations totaled $83,300.
- In 2011, Mandatory Minimum Penalties (MMPs) of $9,000 were assessed for percent removal, coliform bacteria, and copper violations.

The 2013 and 2014 Annual Wastewater Treatment Reports for the AWTF were briefly reviewed to identify any potential compliance issues for Outfall 001. The 2014 report noted 27 incidences of non-compliance issues for the Outfall 001 requirements including:

- Effluent limit violations on 18 occasions, including 1 noncompliant sample for disinfection, 1 noncompliant sample for BOD removal, and several excursions of

effluent TSS. It was noted that weather, and the current drought have impacted the plant operation, and may have been a contributing issue for the TSS violations.

- A brief excursion in the disinfection of the final effluent in August 2014 for up to 10 minutes resulted in incomplete disinfection. This resulted in effluent fecal coliform counts of 49 MPN/100ml.
- One chronic whole effluent toxicity test in March 2014 that appeared to indicate effluent toxicity.
- Exceedances of the plant effluent copper requirement have historically been an issue. Seven times the monthly average was exceeded and twice the daily maximum was exceeded. However, according to plant staff, these exceedances have, for the most part, been resolved due to the fact that water effects ratios (WERs) have been applied to the effluent copper limitations for Outfalls 001 and 002. It is anticipated that a WER will also be applied to Outfall 003. Therefore these have not been included in the 18 violations counted above.
- Exceedances of the Dichlorobromomethane limit twice for daily maximum and twice for monthly maximum in July and October 2014.

In 2013, there were 22 effluent limit violations for Outfall 001. Most of these were similar to the issues reported in the 2014 Annual Report.

On June 15, 2015 the State Board Office of Enforcement conducted an inspection of City wastewater facilities under the Statewide General Waste Discharge Requirements for Sanitary Sewer Systems to assist the Regional Board in enforcement action. Although the inspection was primarily conducted for compliance with the sanitary sewer system permit, the inspectors also reviewed a handful of NPDES discharge violations during the inspection and indicated that they would be reviewing violations since June 2012 for enforcement action including assessment of Mandatory Minimum Penalties (MMPs). Table 2.2 summarizes the violations by year and location from 2013 to 2015. Appendix B shows all of the violations that have occurred since the last ACL was issued.

Although MMPs are not being assessed for violations at Outfall 002 since the AMWS receiving water is not designated a water of the United States, water quality compliance at Outfall 002 is still crucial. Violations of discharge standards at Outfall 002 could be subject to discretionary penalties. A review of the 2013 and 2014 annual reports indicate 13 exceedances of discharge specifications for Outfall 002 (10 for copper and 3 for BOD).

Exceedance of the copper effluent limit was addressed in a Water Effects Ratio (WER) study submitted to the Regional Board in December of 2012, and a modified permit was issued in November 2014. The State Board has indicated that MMPs will be assessed for the period that the WER was under review.

The City projects that the pending ACL for violations since June 2012 may total greater than $200,000, with no administrative action for violations at Outfall 002.

**Table 2.2 Summary of NPDES Discharge Violations From 2013 to 2015[1]**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| Year | Compliance Location | Number of Violations | Parameter | CIP Project Addressing Violation |
|---|---|---|---|---|
| 2013 | Outfall 001 | 3 | Total Suspended Solids[2] | Secondary Treatment, Hydraulic Capacity |
| | | 5 | Dichlorobromomethane | UV |
| | | 4 | Chronic Toxicity | Uncertain[3] |
| | | 1 | pH | UV, Secondary Treatment |
| 2014 | Outfall 001 | 15 | Total Suspended Solids[2] | Secondary Treatment, Hydraulic Capacity |
| | | 4 | Dichlorobromomethane | UV |
| | | 2 | Chronic Toxicity | TBD - Mixing Zone Dilution Credit |
| | | 1 | pH | UV, Secondary Treatment |
| | | 1 | Chlorine | UV |
| | | 1 | Fecal Coliform | UV |
| | Outfall 002 | 5 | Biological Oxygen Demand[4] | Secondary Treatment |
| 2015 | Outfall 001 | 2 | Total Suspended Solids[2] | Secondary Treatment, Hydraulic Capacity |
| | | 8 | Dichlorobromomethane | UV |
| | | 2 | Chronic Toxicity | Uncertain[3] |
| | Outfall 002 | 13 | Biological Oxygen Demand[4] | Secondary Treatment |
| | | 2 | Chlorine | UV |

Notes:

(1) Summary table excludes copper violations which have been addressed by the WER and subsequent modified permit in November 2014. Non-water quality violations including deficient reporting, deficient monitoring, and order conditions are also excluded.
(2) Total Suspended Solids (TSS) violations include concentration, loading, and/or percent removal parameters.
(3) A mixing zone dilution credit (if granted) at the new outfall location or the addition of conventional secondary treatment may help with compliance.
(4) Biological Oxygen Demand (BOD) violation of concentration.

## 2.5 CURRENT PERMIT COMPLIANCE REQUIREMENTS

The 2012 NPDES permit outlines the approved AWTF flow reconfiguration upgrade, including the use of UV disinfection upstream of the new discharge point (Outfall 003). The new flow configuration and discharge point will replace the existing configuration which discharges directly to Humboldt Bay at Outfall 001. The new discharge point will allow for mixing and controlled discharge of freshwater into the wetlands and tidal section of Arcata Bay. The compliance schedule adopted with the permit for the new discharge point and disinfection system includes the following milestones:

- New discharge point and UV disinfection system shall be completed prior to December 1, 2016. An updated compliance schedule will be discussed later in Chapter 8, Capital Improvements Program.
- RWQCB shall be notified 30 days prior to the use of Outfall 003.
- Prior to operation of the new UV disinfection system, the City shall provide written verification of the UV disinfection system capacity based on National Water Research Institute (NWRI) validation testing.
- Prior to operation of the new UV disinfection system, the City shall provide an operation and maintenance plan detailing how the system complies with NWRI guidelines (Note that the NWRI guidelines do not apply to effluent disinfection as they were written specifically for reuse standards and further discussion with the RWQCB will be required).

### 2.5.1 Water Quality Standards

The current NPDES permit recognizes the transition from the current Outfall 001 to the proposed Outfall 003, but essentially requires the same effluent limits for both interim (current) conditions and final compliance. The effluent discharge requirements for final compliance are summarized in Tables 5 and 6 of the NPDES permit, and limits for the interim condition are summarized in Table 7 of the NPDES permit. For reference, the NPDES permit is provided as Appendix A. A flow reconfiguration and disinfection upgrade project is proposed in order to meet these effluent standards, as the City has indicated that permit compliance is crucial.

Since 2012 there have been approximately 20 violations of the permit for disinfection by-products (dichlorobromomethane), at least one violation for chlorine residual, and at least one violation for coliform (bacteria). Implementation of UV disinfection would eliminate the disinfection by products; however, the existing natural treatment system has a very low UV transmittance, which impacts the sizing of the UV needed to meet disinfection requirements. The main indicator of the level of disinfection will be the Fecal Coliform criteria:

- Average monthly - 14 MPN/100 ml.
- Maximum daily - 43 MPN/100 ml.

Ongoing permit violations of plant effluent limits for biological oxygen demand (BOD) (at least 12 violations for BOD in the last 2 years) and suspended solids (at least 21 violations for total suspended solids (TSS) since 2012) indicate a need for additional secondary treatment capacity beyond that of the existing natural system.

### 2.5.2 Flow Reconfiguration Project

As previously discussed, a portion of the of the disinfected secondary effluent is currently routed to the AMWS enhancement wetlands, returned to the chlorine contact basin (CCB) for a second step of chlorine disinfection and dechlorination, and discharged through Outfall 001. One feature of the flow reconfiguration project is that the future configuration will be based on the enhancement wetlands flows being brought back to the AWTF for blending with treatment wetlands effluent prior to disinfection and discharge. All plant flows up to 5.9 million gallons per day (mgd) will be routed to UV disinfection prior to discharge through Outfall 003.

The flow reconfiguration as described in the permit places the UV system downstream of the enhancement wetlands, right before the new discharge compliance point at the brackish marsh. A second option was initially considered for this initial planning study, which is to place the UV disinfection system after the Allen and Hauser wetlands, but upstream of the Gearheart wetland. This configuration would allow for a final buffer before discharge to the brackish marsh. This buffer in the Gearheart wetland would provide a safety factor in case of any issues with the UV system including equipment failure or power outage. Any issue with the UV system could trigger the closing of the final effluent gate to the brackish marsh outfall (003) and subsequent containment of any undisinfected effluent. Provisions could be included in the plant improvement project for a portable pump to be purchased and available to pump the contents of the Gearheart marsh back to the pond system for retreatment, if needed. This concept of a safety factor was also discussed at the initial meeting with the North Coast RWQCB. However, this alternate configuration is not recommended due the following factors:

- The original concept retains a single point of compliance downstream of all enhancement wetlands.
- The original concept provides the benefit of the longer detention time through the complete wetland system prior to discharge.
- The return of any undisinfected flow would require significant pumping to drain the Gearheart Wetland of undisinfected effluent.
- The revised flow reconfiguration concept would require modifications to the existing wetlands transfer structures, which would add cost to the project.

- The new brackish marsh discharge will provide additional protection if the existing tide gate is modified in a future project to provide isolation of the effluent discharge.

Therefore, the flow reconfiguration with UV immediately upstream of Outfall 003 is recommended.

## 2.6 FUTURE REGULATORY CONSIDERATIONS

The current permit will be open for renewal in 2017, and could include additional discharge requirements or other provisions. The following list outlines future regulatory issues that should be considered in planning and future design for the AWTF:

- **Nutrients.** Nutrients such as nitrogen and phosphorus have been identified as potential issues. The North Coast RWQCB is currently reviewing limits for these constituents, and they will probably be added to future discharge permits. Ammonia discharge standards in freshwater have been regulated by the EPA since 2013. North Coast dischargers are beginning to be regulated for ammonia and nitrogen discharge standards. The City of Ferndale has an ammonia limit of 1.0 milligrams per liter (mg/L) and a nitrate limit of 10 mg/L in their current permit requirement. They are however an inland stream discharger.

  The City of Eureka originally was permitted as an ocean discharge and their NPDES permit used an ammonia limit (as nitrogen) of 0.6 mg/L as the Basin Plan water quality objective. Due to the dilution credit granted Eureka, the resulting effluent limit was not prohibitive. However, Eureka just received a new permit in June 2016, which eliminated their dilution credit, and determined that they were a Humboldt Bay (estuarine) discharger and as such would be required to meet bay discharge standards. Their new permit includes effluent limits on ammonia, with an average monthly ammonia limit of 4.1 mg/L ammonia (as nitrogen), and a daily limit of 10 mg/L ammonia (as nitrogen). In addition, it was determined that the discharge was subject to the Enclosed Bays and Estuaries Policy, which requires a finding of enhancement in order to allow a bay discharge.

  Arcata's current NPDES permit requires monitoring for total ammonia and nitrate to determine the assimilative capacity of the receiving water for these nutrients and to generate background data for these constituents for a future Reasonable Potential Analysis.

- **Wet Weather Flows.** The permit does not completely define the flow reconfiguration for peak wet weather flows. It prohibits discharge of flows greater than 5.9 mgd to new Outfall 003. Therefore, flows above 5.9 mgd must be either stored in the ponds and wetlands or discharged on an emergency basis to existing Outfall 001. In the latter case, the existing chlorine and sulfur dioxide gas system would need to remain on-line and be used for disinfection of wet weather flows. Once the new UV system is on-line, additional improvements to the existing disinfection and dechlorination

systems might be considered to meet any future permit requirements. Since the City has already taken significant steps to address and reduce inflow and infiltration while wet weather peak flows have persisted, handling of wet weather flow will require additional definition and potentially additional improvements to meet permit compliance.

- **Dilution Credits.** New Outfall 003 is currently being modelled to determine if any dilution credits might be justifiable for the AWTF effluent discharge. If dilution credits are allowed, then the effluent toxicity lab results might be more favorable and exhibit a lower number of failed tests.
- **pH.** The pH of the AWTF is influenced by the natural treatment system; the pH has dipped at times during "split basin" mode of operation, when the AMWS flows are returned to the chlorine contact basin. It is generally thought that the chlorination / dechlorination process is responsible for the lowered pH so this might only be a future issue for wet weather flows. The effluent pH will also impact the ammonia toxicity of the effluent. Any process changes should allow for pH control.
- **Emerging Contaminants.** Constituents of emerging concern (CECs) are pharmaceuticals and personal care products, industrial chemicals present at low concentrations, and chemicals that may affect hormone status ("endocrine disruptors.") In general these and other low concentration contaminants have been identified as potential future issues both for effluent discharges and recycled water production. Most of the research work to date has consisted of limited monitoring, especially for recycled water and drinking water supplies. The fate of these contaminants in a natural system is not clearly understood and therefore may require monitoring by the RWQCB in a future permit revision. It was determined, however, that permitting around CECs would likely not take affect within the 20-year planning window for this Facility Plan.
- **Bacterial Quality of Humboldt Bay.** The bacterial quality of Humboldt Bay was noted as a particular concern in the RWQCB Water Quality Control Plan for the North Coast Region (Basin Plan) due to the location of several of California's most important commercial oyster farms in the northern lobe of the estuary known as Arcata Bay. The shellfish harvest areas are classified by the California Department of Health Services according to several criteria, including their proximity to pollutant sources and the Department's knowledge that such areas are (or are not) of suitable sanitary quality. The Basin Plan identifies stormwater runoff and point source discharges as having the greatest impact on water quality in Arcata Bay. The Basin Plan noted that anytime there was a storm of more than a half inch of rainfall, the bacterial quality was impacted and shellfish harvesting was prohibited. The effluent limitations for fecal coliform bacteria for the new Outfall 003 were retained from the previous permit and reflect water quality objectives for protection of shellfish harvesting areas.

## 2.7 MEETINGS WITH NORTH COAST RWQCB

An initial meeting was held with the RWQCB staff to discuss the project in June 2015. The project objectives and NPDES permit requirements were reviewed during the meeting. A subsequent meeting took place on June 27, 2016. At that time the Wastewater Treatment Facility Improvements project draft Facility Plan was reviewed, and current NPDES permit requirements were discussed with the RWQCB.

The main points from the discussion were:

- Board staff wants to see bypass of flows greater than 5.9 mgd eliminated, including I&I reduction to reduce peak flows and reduce total volume to be stored.
- UV disinfection design criteria were discussed and it was proposed that UV disinfection will be based on a minimum UVT of 35 percent. City needs input on design dose and disinfection objectives, including coliform or virus reduction,
- Board staff indicated a requirement to have the total flow receive treatment through the enhancement wetlands. They noted that the Enclosed Bays and Estuaries Policy requires enhancement of the receiving water as a condition of discharge, including polishing of the effluent. The City and City's consultant noted that enhancement wetlands do not have the capacity for 5.9 mgd peak wet weather flow, and no land is available for additional wetland construction.
- Board staff indicated that Arcata could expect an ammonia limit in their next permit (in 2017) similar to Eureka, based on the similar Humboldt Bay discharge. The City will be required to do a Reasonable Potential Analysis (RPA) to develop the limit based on salinity, pH and other factors at the point of discharge. Board staff noted that they were no longer considering the bay a drinking water source, so nitrates (or total nitrogen) reduction was not required.

Implementation schedule was discussed, and Board staff indicated that since the NPDES permit expires in July 2017, a Report of Waste discharge should be filed at least 6 months before the permit expiration (by January 2017).

## 2.8 NORTH COAST RWQCB REPORT OF WASTE DISCHARGE SUBMITTAL

After the June 2016 Facility Plan was submitted to the City, the City prepared and submitted a Report of Waste Discharge (ROWD) to the RWQCB in January 2017. The submittal of the ROWD is the first step in the renewal of the facilities discharge permit (NPDES). A copy of the required ROWD forms and supplemental ROWD information is included in Appendix T. The ROWD information outlined the hydraulic and treatment capacity issues and provided a schedule for compliance. In addition, it included a proposed UV disinfection dose of either 35 or 50 mJ/cm$^2$ depending on the disinfection criteria for the discharge. The second request related to the disinfection system was the request for split compliance for disinfection compliance indicator organism. The City requested that the

disinfection criteria should be applied just downstream of the UV disinfection process (Outfall 002), prior to discharge to the enhancement wetlands. All other compliance parameters would be achieved downstream of the enhancement wetlands (Outfall 003).

At the date of this revision, the RWQCB had not made any comments on the ROWD, or the supplemental information, and an updated permit is not expected until later in 2017.

# FLOW AND LOAD EVALUATION

## 3.1 INTRODUCTION

This chapter discusses the plant influent flow and load the Arcata Wastewater Treatment Facility (AWTF) was designed for, as well as the flow and loads that are expected over the 20- year planning horizon.

## 3.2 EXISTING FACILITY DESIGN FLOW AND LOADS

The AWTF currently treats municipal wastewater from the City of Arcata to meet treatment standards and discharge requirements established by the North Coast Regional Water Quality Control Board (RWQCB). These requirements are outlined in the City's National Pollutant Discharge Elimination System (NPDES) permit, which was last renewed in 2012.

Table 3.1 provides a summary of the current plant permitted influent flows in million gallons per day (mgd).

**Table 3.1 AWTF Influent Permit Flow Summary**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| | Flow (mgd) |
|---|---|
| Average Dry Weather Design Flow | 2.3 |
| Average Wet Weather Design Flow | 5.0 |
| Peak Wet Weather Design Flow | 5.9 |
| Peak Instantaneous Flow | 16.5 |

According to the 1987 "City of Arcata Wastewater Treatment Plant Modifications" record drawings, the AWTF was designed for an average annual plant influent biochemical oxygen demand (BOD) loading of 4,100 pounds per day and total suspended solids (TSS) loading of 3,400 pounds per day for a design population of 19,056 in 1992. This loading was originally designed for the existing primary treatment facility and for secondary treatment provided by "sedimentation and stabilization" Oxidation Pond Nos. 1 through 3 (total of 49 acres) and a shallow "marsh" (4 acres), followed by the enhancement wetlands (30 acres). The treatment wetlands (TWs) were constructed sometime after the 1987 modifications project in phases that occupied a portion of Oxidation Pond 3. The last phase, TW Nos. 5 and 6, were constructed in 2012 from the remainder of Oxidation Pond 3.

The 1987 design average annual plant influent flow of 2.3 mgd and design maximum month plant influent flow of 5.9 mgd correspond to the permitted average dry weather flow and permitted peak wet weather flow, respectively (see Table 3.2).

| Table 3.2 AWTF Design Flow and Loads per 1987 Drawings<br>Wastewater Treatment Facility Improvements Project<br>City of Arcata | |
|---|---|
| | **Design criteria** |
| Average Annual Design Flow, mgd | 2.3 |
| Maximum Month Design Flow, mgd | 5.9 |
| Influent Average Annual $BOD_5$, ppd | 4,100 |
| Influent Average Annual TSS, ppd | 3,400 |
| Design Population | 19,056 |

The State Department of Finance population estimate for the City of Arcata in January 2015 was 18,085, and for January 2016 was 18,695 (including Glendale connections). The influent flows and loads have changed since 1987 due to conservation efforts in recent years and changing characteristics of the community, such as the growth of food industries such as microbreweries. It is important when developing a facility plan to consider the current loading as well as the potential for future changes.

During development of the Draft Facility Plan, anticipated community growth has been a discussion item that needs to be finalized. The City originally anticipated a 10 percent growth in the community based on the General Plan's redevelopment plans and planned growth at Humboldt State University. For the purposes of the Draft Facility Plan evaluation, a 10 percent growth was originally assumed. After further discussion with the City at the Council meeting on June 13, 2016, followed by input from the City's Community Director, the community growth is anticipated to be 20 percent from now through buildout. Updates in the Final Facility Plan address this additional growth factor. Due to the conservation efforts seen in recent years, the growth is primarily anticipated to impact influent loading to the WWTP, and will not change the design flows.

## 3.3 INFLUENT FLOW EVALUATION

The following daily influent flow data sets were provided to Carollo by both the City and the City's consultant, Arcata Marsh Research Institute (AMRI):

- Plant Influent (Point 1) flow from January 1988 to December 2015, provided by AMRI.
- Plant Influent (Point 1) flow from January 2003 to September 2015, provided by the City.

A comparison of the two flow data sets indicated that the data was of the same origin and originally collected by the City. The flow data was plotted and the percentile flows were tabulated. For influent flow from January 1988 to December 2015, the permitted design peak wet weather flow of 5.9 mgd corresponds to between a 98th and 99th percentile, and the permitted design average dry weather flow of 2.3 mgd corresponds to a 68th percentile.

For influent flow from January 2003 to September 2015, the permitted design peak wet weather flow of 5.9 mgd corresponds to a 99th percentile and the permitted design average dry weather flow of 2.3 mgd corresponds to a 77th percentile. For both data sets, the permitted design average wet weather flow of 5.0 mgd corresponds to a 97th percentile.

The data was also analyzed for duration of high influent peak flow periods. Within the period of record, the two highest peak flow durations occurred at the beginning and the end of December 1996. During each of these periods, plant influent flows higher than 5.9 mgd occurred for an average of 8 consecutive days, corresponding to about 71 to 76 million gallons (MG) of total influent flow. The flow data for these periods is included in Appendix C.

## 3.4 INFLUENT LOAD EVALUATION

The following influent concentration data sets were provided to Carollo by both the City and AMRI:

- Plant Influent (Point 1) BOD from January 1988 to December 2015, provided by AMRI.
- Plant Influent (Point 1) BOD from July 2003 to September 2015, provided by the City.
- Plant Influent (Point 1) TSS from January 1988 to December 2015, provided by AMRI.
- Plant Influent (Point 1) TSS from July 2003 to October 2015, provided by the City.
- Plant Influent (Point 1) Ammonia ($NH_3$) from February 2011 to August 2013, provided and collected by AMRI.
- Plant Influent (Point 1) $NH_3$ from April 2013 to December 2015, provided by the City.

A comparison of the concentration data sets provided by the City and AMRI indicated noticeable variability between the data sets. The City indicated that the data they provided is compliance data sent to the Regional Board, and directed Carollo to primarily use the City data for analysis despite a shorter period of record than for the AMRI data. Data from the entire period of record (by City and AMRI) was used for comparison with City data.

The daily influent BOD, TSS and NH3 concentration and corresponding flow data were used to calculate daily influent loads. The 90th percentile concentrations and loads were then calculated. Carollo recommends using 90th percentile loads as the basis of design for evaluating capacity of existing facilities and for sizing new secondary treatment processes. To evaluate treatment capacity of secondary treatment facilities, BOD load is the primary design parameter. BOD load was evaluated two ways: actual 90th percentile load, and a calculated equivalent load based on 90th percentile concentration at a design flow.

For City data from 2003 to 2015, the actual 90th percentile BOD load is 4,000 pounds per day (ppd), which is shown in Table 3.3. This value appears reasonable compared with the

observed monthly median influent BOD load over the entire period of record, as seen in Figure 3.1. For City data from 2003 to 2015, the calculated load based on a 90th percentile BOD concentration of 280 mg/L is too conservative. At the permitted design average dry weather flow of 2.3 mgd, the calculated equivalent load would be 5370 lb/d, which is much higher than the observed monthly median influent BOD load for the entire period of record. The recommended loads for TSS and ammonia are also listed in Table 3.1 and were developed from the same actual data.

The recommended design plant influent loads are summarized in Table 3.3.

**Table 3.3 Recommended Design Plant Influent Loads**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| Constituent | 90th Percentile Influent Load (1), ppd | Design Influent Load With 10% Growth (2), ppd | Design Influent Load With 20% Growth (3), ppd |
|---|---|---|---|
| BOD | 4,000 | 4,400 | 4,800 |
| TSS | 5,760 | 6,340 | 6,910 |
| $NH_3$ | 880 | 970 | 1,060 |

Notes:
(1) Based on City daily sample data from 2003 to 2015 for BOD and TSS, and from 2013 to 2015 for $NH_3$.
(2) Assumed City of Arcata growth projection in Draft Facility Plan.
(3) Assumed City of Arcata growth projection in Final Facility Plan per June 13, 2016 City Council meeting.

Plots of the influent data are included in Appendix C.

# EXISTING FACILITIES AND CAPACITY EVALUATION

## 4.1 INTRODUCTION

This chapter provides an overview of the existing facilities at the Arcata Wastewater Treatment Facility (AWTF) and includes the following sections:

- An existing facilities description summarizing the general function and configuration of the treatment facilities at the AWTF.
- A capacity assessment summarizing the hydraulic and treatment capacities of the major liquid treatment unit processes at the AWTF.

## 4.2 FACILITY OVERVIEW

In order to maintain compliance with the discharge permit, municipal waste from the City of Arcata is treated through a series of unit processes at the AWTF. Figures 4.1 and 4.2 show the site layout and unit process flow schematic for the ATWF, respectively. Table 4.1 provides a summary of the current plant permit influent flows in million gallons per day (mgd). Appendix D includes process flow diagrams for the AWTF facilities (from *AWTF Operations and Maintenance Manual*).

**Table 4.1 AWTF Influent Permit Flow Summary**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| | **Flow (mgd)** |
|---|---|
| Average Dry Weather Design Flow | 2.3 |
| Average Wet Weather Design Flow | 5.0 |
| Peak Wet Weather Design Flow | 5.9 |
| Peak Instantaneous Flow | 16.5 |

## 4.3 EXISTING FACILITIES DESCRIPTION

The following sections provide a brief description of the existing flow configuration and hydraulic treatment capacity of the AWTF.

### 4.3.1 Headworks

The headworks facility provides screening and grit removal of raw sewage that is pumped from the service area. The headworks facility is comprised of the following:

- Two 2.5-mgd Archimedes screw pumps.
- Two 5.0-mgd mechanically-cleaned bar screens that drop screenings into a single belt conveyor for transport to a roll-off bin.
- A parshall flume for flow metering.
- A grit removal system including a horizontal-flow grit chamber with grit pumping and grit classification.

### 4.3.2 Primary Clarifiers

The primary treatment facilities consist of two primary clarifiers, with a total treatment capacity of 5.0 mgd. Flow from the headworks is split to the primary clarifiers after grit removal:

- Clarifier No. 1 has a 26-foot diameter and a design treatment capacity of 1.0 mgd. It is fed by a 12-inch diameter influent pipeline.
- Clarifier No. 2 has a 60-foot diameter and a design treatment capacity of 4.0 mgd. It is fed by a 24-inch diameter influent pipeline.

The clarifiers are center-feed, peripheral-withdrawal type clarifiers. In the clarifiers, suspended solids gradually settle to the bottom of the tanks as primary sludge. Mechanical scrapers collect settled sludge and skimmer arms collect floatable scum in the primary clarifiers. Three primary sludge pumps pump solids from the bottom of the primary clarifiers to the primary anaerobic digester. Scum collected on the surface of the primary clarifiers passes through a liquid/solid separator and the scum solids are transferred to a roll-off bin for disposal.

### 4.3.3 Influent Bypass Pumping

Influent flows greater than the 5.0 mgd headworks capacity bypass both the headworks facility and primary clarifiers and are pumped, via the First Street Pump Station (located offsite) and the Influent Storm Pump (at the Headworks), directly to the oxidation ponds. These pumps provide peak wet weather flow capacity and redundancy for the headworks screw pumps.

### 4.3.4 Oxidation Ponds and Pond Pumping

Primary effluent and influent bypass flows are conveyed by gravity to two facultative oxidation ponds for secondary treatment and stabilization. Secondary treatment is provided through a series of both biological and chemical reactions in both aerobic and anaerobic environments within the ponds. The two oxidation ponds have a total surface area of

46 acres (ac) and a total storage and treatment volume of 89 million gallons (MG). The normal mode of operation is in series, where primary effluent is routed to Oxidation Pond 1 and then flows by gravity through transfer structures to Oxidation Pond 2. Pond influent and effluent piping is also set up to operate in parallel if needed.

Dry weather effluent from Oxidation Pond 2 typically flows by gravity to the treatment wetlands for further secondary treatment. Flow in excess of the treatment wetlands capacity is piped to the wet well of the Pond Pump Station (PPS) for discharge to the chlorine contact basin (CCB). In high wet-weather flow scenarios, the Emergency Pond Pump Station (EPPS) can also be used. These pump stations are described in further detail in the capacity evaluation section of this chapter.

### 4.3.5 Treatment Wetlands and Effluent Pumping

Effluent from the oxidation ponds flows by gravity to Treatment Wetlands 1 through 3 and 5 through 6 for further secondary treatment. A small portion of the oxidation pond effluent is also pumped to Treatment Wetland 4, a shallow pilot wetland cell. The 9.7 acres of treatment wetlands reportedly have a capacity to treat 3.3 mgd, which is based on a minimum hydraulic retention time (HRT) of 4 days. Each treatment wetland has one or two influent distribution boxes with manually-adjustable weir gates that are set to control the flow split from the oxidation ponds. The treatment wetlands are currently operated in parallel.

Treatment wetlands effluent is pumped to the CCB for disinfection. There are two main pump stations that collect flow from the treatment wetlands for pumping to the CCB and enhancement wetlands: the wetlands Pump Station 1 (PS1), and the wetlands Pump Station 2 (PS2). These are described in further detail in the capacity evaluation section of this chapter.

### 4.3.6 Disinfection

Effluent from the ponds or treatment wetlands is pumped to the CCB. Disinfected effluent flows by gravity to either the enhancement wetlands or is discharge to Humboldt Bay. Currently all pond and treatment wetland flows go through the CCB, in either a split or combined mode, described in more detail in Chapter 7. The design capacity of the CCB is 5.9 mgd based on a 30 minutes of contact time.

### 4.3.7 Enhancement Wetlands

The Enhancement Wetlands are hydraulically limited to 1.7 mgd, which is the capacity of the Enhancement Wetlands Pump Station (EWPS). The AWTF operates three enhancement wetlands in series that have a total surface area of 33 acres and approximately 22 MG of storage. Enhancement wetlands effluent is currently pumped back to the CCB via the EWPS for disinfection and discharge.

## 4.4 EXISTING HYDRAULIC CAPACITY SUMMARY

This section provides a summary of the existing hydraulic capacity for the liquid treatment facilities at the AWTF. A summary of the existing process treatment capacity evaluation is discussed later in this chapter.

### 4.4.1 Existing Hydraulic Profile

The existing plant hydraulic profile was summarized as part of the undated AWTF Operations and Maintenance Manual project. For reference, these profiles are provided in Appendix E.

### 4.4.2 Influent Pumping

There are several influent pump stations serving the AWTF:

- **First Street Pumps.** The First Street Pumps are variable speed, natural-gas driven pumps that are used when influent flow to the treatment plant is greater than 5.0 mgd (capacity of headworks and primary clarifiers). Each of the pumps has a design capacity of 5.5 mgd.
- **Influent Storm Pump.** The Influent Storm Pump is a variable speed, diesel pump that diverts influent flow greater than 5.0 mgd from the headworks influent wet well directly to the oxidation ponds. The Influent Storm Pump has a capacity of 5.0 mgd.
- **Influent Screw Pumps.** The Influent Archimedes Screw Pumps each have the capacity to lift 2.5 mgd from the headworks influent wet well to the headworks bar screens.

Table 4.2 summarizes the firm influent pumping capacity.

**Table 4.2 Influent Pumping Capacity Summary**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| Pump Station | Firm Capacity (mgd) |
|---|---|
| Influent Bypass Pumping[(1)] | 10.5 |
| Headworks Influent Screw Pumps[(2)] | 2.5 |

Notes:
(1) Combined firm pumping capacity of the First Street Pumps and the Influent Storm Pump. Assumes the largest unit is out of service.
(2) Assumes the largest unit is out of service.

While it appears that there is sufficient influent pumping capacity, much of the influent flow would need to be bypassed around the headworks and primary clarifiers if one of the screw pumps is taken out of service. Upsizing the screw pumps would increase the reliability of the preliminary and primary treatment facilities. The screw pumps could either be replaced

in kind or with another type of pump. Plant staff has indicated a preference for submersible pumps.

### 4.4.3 Headworks

With the exception of the influent screw pumps, the headworks facility appears to have sufficient hydraulic capacity to accommodate the original design flow of 5.0 mgd:

- **Bar Screens.** There are two bar screens and each screen was originally designed to handle 5.0 mgd. The actual channel hydraulic capacity was not evaluated.
- **Grit Chamber.** There is one grit chamber that was originally designed to handle flow up to 5.0 mgd. However, plant staff has indicated that the unit has difficulty handling wet weather flows, so the current capacity is less than 5.0 mgd. There is no redundancy (which is not uncommon), so channel isolation gates are used to shut off flow to the grit chamber if maintenance is required.
- **Grit Pumping.** There are two grit pumps (one duty, one standby). Each pump has the capacity to transfer 200 gallons per minute (gpm) of grit slurry from the bottom of the grit chamber to the grit classifier, which is sufficient to accommodate the original 5.0-mgd design flow.
- **Grit Classification.** There is a single grit classifier, so maintenance would require shutting down flow to the grit chamber. If this is operationally problematic, a redundant classifier could be installed as part of a headworks rehabilitation project.

### 4.4.4 Primary Treatment

The two primary clarifiers have a total surface area of approximately 3,400 square feet (sf). In most cases, only primary clarifier No. 2 is used. At the design flow rate of 5.0 mgd, the overflow rate through primary clarifier No. 2 was calculated to be approximately 1,770 gallons per day per square foot (gpd/sf), which is much lower than the industry-standard recommendation of 3,000 gpd/sf at peak wet weather flow. However, plant staff has indicated that removal rates and process performance drops significantly at flow rates greater than 4.2 mgd.

### 4.4.5 Oxidation Ponds

Effluent from the primary clarifiers flows by gravity in a 30-inch pipeline to the oxidation ponds, which are normally operated in series. Plant staff has indicated that the transfer structures between Oxidation Ponds 1 and 2 cause a hydraulic bottleneck during wet weather events. To relieve this bottleneck, the oxidation ponds are operated in a modified parallel mode when the influent bypass pumping is initiated. Additionally, as a fail-safe to mitigate the potential for overflow of Oxidation Pond 1, a spillway was constructed in the berm shared with Oxidation Pond 2. The ponds have a total volume of 89 million gallons (MG) and an average constructed depth of 5.5 feet. At the PWWF of 5.9 mgd when the ponds are empty of sludge, they have 14 days of detention time. The peak flow detention

time may be insufficient depending on the plant loading, season, and weather. At the average flow of 2.3 mgd when the ponds are empty of sludge, the oxidation pond detention time is over 35 days, which should be sufficient for secondary treatment.

Due to deferred sludge maintenance over the last 30 years, current estimates of solids buildup in the ponds range from one to two feet in each pond. Assuming an average solids buildup of 1.5 feet, the peak flow detention time at 5.9 mgd is 10 days and the average flow detention time at 2.3 mgd is 26 days.

### 4.4.6 Treatment Wetlands

Effluent from the oxidation ponds flows by gravity to the treatment wetlands, which are operated in parallel. Per information provided in the AWTF Operations and Maintenance (O&M) Manual, the weirs in the distribution boxes are manually adjusted to maintain the desired flow split through the six treatment wetlands. These adjustments are made on a regular basis, although the flow split is difficult to maintain, since each set of treatment wetlands can treat a different flow rate.

Treatment Wetland Nos. 1 through 6 have a total volume of 13.2 MG and an average operating depth of 3.8 feet when empty of solids or vegetation. At the PWWF of 5.9 mgd, they have 2.0 days of detention time, which is reportedly considered insufficient for treatment capacity. A more typical design value for wetlands systems is on the order of four days, which is approximately 3.0 mgd.

Due to deferred sludge and vegetation maintenance over the last 30 years, operating depth is assumed to be reduced. The City and AMRI report that reliable treatment capacity of Treatment Wetland Nos. 1 through 6 is typically about 1.8 mgd. In order to manage this capacity deficiency, flows greater than 1.8 mgd to 5.9 mgd can be pumped around the treatment wetlands.

### 4.4.7 Secondary Effluent Pumping

The effluent pump stations pump secondary-treated effluent from the oxidation ponds, the treatment wetlands, or the enhancement wetlands for discharge into the CCB. A summary of the measured effluent pumping capacities is provided in Appendix F.

#### 4.4.7.1 PPS and PS1

The PPS and PS1 are sited adjacent to each other, within a common structure. The pump station wet well has an interior divider wall with an isolation gate. When the gate is open, the pumps are supplied via a common wet well. During normal operation, however, the slide gate is closed and the two wet wells are hydraulically isolated from one another.

In the normal mode of operation, the PPS lifts flow from Oxidation Pond 2 to the CCB, and consists of three 1.8-mgd pumps, with a firm pumping capacity of 2.9 mgd. PS1 lifts flow

from Treatment Wetlands 1 through 4 to the CCB and consists of three 1.2-mgd pumps with a firm capacity of 2.3 mgd.

#### 4.4.7.2 EPPS

The EPPS lifts flow from Oxidation Pond 2 to the CCB. The EPPS is typically operated to supplement the capacity of the PPS during extremely high flow scenarios. The EPPS consists of two 3.6-mgd pumps, one duty, and one standby.

#### 4.4.7.3 PS2

PS2 was originally piped to lift flow from Treatment Wetlands 5 and 6 to the CCB. However, pumping directly to the CCB has shown to disrupt the flow-paced chlorine injection system. In order to correct this problem, temporary piping was installed to re-route the discharge from the CCB to Junction Box 1, which flows by gravity into the wet well of PS1. PS2 consists of two 1.7-mgd pumps, one duty, and one standby.

#### 4.4.7.4 EWPS

The EWPS (also known as the Hauser Pump Station) lifts effluent from the Hauser Enhancement Wetland to the CCB. The EWPS consists of three 1.5-mgd pumps and originally had a firm pumping capacity of approximately 3.0 mgd. However, the pumps are failing and the most recent testing indicated a firm pumping capacity of 1.2 mgd. Two of the pumps are controlled with variable frequency drives (VFDs) and the third is fixed speed.

The pumps are operating at the end of the pump curves, which is not ideal and may be one of the reasons for operational issues with this pump station. Additionally, the pump curve is not in alignment with measured flow values, which indicates that the pump impellers have experienced some wear and are not operating on their published curves.

#### 4.4.7.5 Effluent Pumping Summary

Table 4.3 summarizes the effluent pumping capacity.

### 4.4.8 Chlorine Contact Basin

Effluent from the oxidation ponds and treatment wetlands is pumped to the CCB via the PPS and PS1. In wet weather conditions, the EPPS is also used to lift flow to the CCB. At the flow rate of 5.9 mgd, flow through the CCB has a contact time of 30 minutes, which is typically sufficient for effluent discharge.

The main points of the hydraulic analysis include the following:

- The estimated hydraulic detention time is based on combined basin mode in the CCB with no return flow from the Enhancement Wetlands.
- The CCB effluent weir sets the elevation in the basin and is not submerged at 5.9 mgd.

- There is very little head loss through the CCB.

**Table 4.3 Effluent Pumping Capacity Summary**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| Pump Station | Firm Capacity[1] (mgd) |
|---|---|
| PPS | 2.9 |
| PS1 | 2.3 |
| EPPS[2] | 3.6 |
| PS2[3] | 1.7 |
| EWPS | 1.2 |

Notes:
(1) Assumes the largest unit is out of service.
(2) The EPPS is only operated during periods of peak wet weather and was not included in the overall secondary effluent pumping capacity per the City's request.
(3) PS2 does not discharge directly to the CCB, so the capacity was not included in the overall secondary effluent pumping capacity.

### 4.4.9 Enhancement Wetlands

Disinfected treatment wetlands effluent flows by gravity in a 30-inch pipeline from the CCB to the enhancement wetlands, which are typically operated in series. A hydraulic capacity analysis was completed by AMRI in order to better understand the feasibility of the flow reconfiguration project.

The main points of the AMRI hydraulic analysis include the following:

- Treatment wetlands effluent flows by gravity through the chlorine contact basin and the enhancement wetlands to the EWPS wet well, which serves as the downstream control point. As discussed above, the EWPS pumps effluent back to the CCB for further disinfection and discharge through Outfall 001.
- Most of the head loss in this portion of the hydraulic profile occurs at the sharp-crested weirs in the distribution boxes and junction structures. Weir elevations were taken from the 1984 drawings and should be confirmed.
- There do not appear to be any hydraulic capacity bottlenecks in between the chlorine contact basin and the EWPS wet well at the modeled PWWF of 5.9 mgd.

### 4.4.10 Hydraulic Capacity Summary

Table 4.4 provides a summary of the existing hydraulic capacity at the AWTF.

The main hydraulic capacity limitations or bottlenecks are the following areas:

- Headworks pumps - lack redundancy.

- The single Primary clarifier limits capacity at peak flows.
- Treatment wetlands and effluent pump stations lack capacity to accommodate permit peak flows.
- Enhancement wetland effluent pumps station lack capacity to accommodate permit peak flows.
- There is concern that the enhancement wetlands would not provide any treatment at flows greater than 2.3 mgd.

**Table 4.4 Existing Flow Capacity Summary**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| Unit Process | Hydraulic Capacity (mgd) |
|---|---|
| Influent Bypass Pumping(1) | 10.5 |
| Headworks: Pumping(1) | 2.5 |
| Headworks: Bar Screens(2) | 5.0 |
| Headworks: Grit Removal(2) | 5.0 |
| Primary Clarifiers(2)(3) | 4.0 |
| Oxidation Ponds(4) | 5.9 |
| Treatment Wetlands(5) | 2.3 |
| Pond and Treatment Wetlands Effluent Pumping(6) | 5.2 |
| Chlorine Contact Basin | 5.9 |
| Enhancement Wetlands | 2.3 |
| Enhancement Wetlands Pumping(7) | 1.8 |

Notes:
(1) Assumes largest pump is out of service.
(2) Influent flow in excess of 5.0 mgd is bypassed around the headworks facility and primary clarifiers and routed directly to the oxidation ponds.
(3) Capacity based on a single primary clarifier.
(4) Capacity is based on 15-day detention time.
(5) Flow in excess of 2.3 mgd is pumped directly from Oxidation Pond 2 to the Chlorine Contact Basin.
(6) The sum of the capacities of three PS1 pumps and two PPS pumps in parallel, which is the firm pumping capacity under the current operational arrangement. The PS2 pumping capacity was not considered because it does not discharge directly to the CCB.
(7) Flow in excess of 1.8 mgd design capacity is discharged from the CCB, through Outfall 001 and into Humboldt Bay.

## 4.5 NATURAL SYSTEM TREATMENT CAPACITY EVALUATION

### 4.5.1 Process Capacity Background

The existing treatment processes at the City of Arcata Wastewater Treatment Facility (WWTF) were constructed in 1987, with some facility improvements since then including conversion of one oxidation pond to treatment wetlands. The need for a comprehensive approach to facility improvements was first addressed during the initial development of this facility plan project in September 2015. During review with the City, it was noted that the WWTF may have a secondary treatment capacity shortfall that impacts the ability to reliably meet permit requirements. The treatment capacity shortfall was initially reviewed with City staff during a phone conference on October 29, 2015, and then addressed in a follow-up workshop on November 5 and 6, 2015. The presentation from that phone conference and the workshop presentation are included in Appendix G.

Several indications point to the need for evaluating secondary treatment capacity. As discussed in Chapter 2, the plant has experienced operational issues related with treatment capacity, including NPDES discharge violations of both BOD and TSS. Treatment capacity, as well as hydraulic capacity and detention time, have likely been impacted by 30 years of solids accumulation. Deferred vegetation maintenance in the wetland system (treatment wetlands and enhancement wetlands) has also impacted the ability for the wetlands to remove solids and maintain optimum flow capacity.

The City is planning an operational conversion of the natural system to a single-pass flow mode to pass up to 2.3 mgd through the enhancement wetlands, as well as a disinfection process change from chlorination to UV disinfection. In addition, recent UV transmittance (UVT) data collected for this project indicated that the natural system has a low UVT at certain times of the year which substantially increases the UV disinfection cost.

This section summarizes the analysis of available plant flow and constituent concentration data for evaluating current secondary treatment capacity at the WWTF. Plant data analysis was used both to confirm existing WWTF treatment capacity and to provide the basis of design for new and upgraded plant processes recommended for the WWTF Improvements Project. Conceptual design criteria recommendations for new and upgraded plant processes are discussed in Chapter 6, Alternatives.

### 4.5.2 BOD Loading Criteria

The basis for evaluating current treatment capacity of the existing natural system was determined by analyzing a combination of design criteria and available plant data, and confirmed by discussions with City staff and AMRI.

Typical wastewater treatment BOD loading criteria in a natural system varies depending on a variety of factors including the treatment purpose, climate (sunlight and temperature), solids accumulation, vegetation management, and short circuiting. The primary treatment

purpose of oxidation ponds are to remove organic loading (BOD and ammonia), while the primary treatment purpose of treatment wetlands are to remove solids. The enhancement wetlands provide effluent polishing prior to Bay discharge, as well as additional benefits such as wildlife habitat creation and recreation.

Published values for design BOD loading in an oxidation pond can range from 35 to 125 ppd/acre due to a variety of climates and facility conditions ("Natural System for Waste Management and Treatment," Reed et al). For Northern California, Carollo recommends an oxidation pond loading criteria of 25 ppd/acre for non-aerated ponds, which has been confirmed at Napa Sanitation District and other Northern California facilities. This loading level has been confirmed to provide an effluent that can meet an average monthly effluent discharge limit of 30 milligrams per liter (mg/L) $BOD_5$ and 30 mg/L TSS. The AWTF Oxidation Ponds 1 and 2 have a total of 46 acres and an average depth of 5.5 ft. Aerated ponds typically have a minimum of 6.5 feet depth (2 m; Reed et al). Pond 1 has eight mechanical aerators that are in poor condition and several have not been used for a number of years; Pond 2 does not have aerators. Based on a 25 pounds per day (ppd) BOD/acre design criteria, maximum BOD loading to the oxidation ponds should be 1,150 ppd without aerators.

Published values for design BOD loading in a constructed wetland depends on whether the wetlands are fully vegetated or open water free water surface (FWS) type ("Manual - Constructed Wetlands Treatment of Municipal Wastewaters Constructed," U.S. EPA, September 2000). For a fully vegetated FWS wetland, maximum BOD loading of 35 ppd/acre (40 kg/ha-d) is recommended if a secondary effluent BOD standard of 30 mg/L is to be met. For an open water FWS wetland, maximum BOD loading ranges from 40 to 54 ppd (45 to 60 kg/ha-d). The AWTF treatment wetlands were designed primarily for solids removal and only Treatment Wetlands 1 and 2 have depths greater than 4 feet, which is typically necessary for open water surface FWS wetlands. Treatment Wetlands 1-6 have a total of 9.7 acres, not including emergent vegetation. Based on a 35 ppd BOD/acre design criteria, maximum BOD loading to Treatment Wetlands Nos. 1 through 6 should be 340 ppd. In the future, if 2.3 acres of Treatment Wetlands 7 is constructed, maximum BOD loading to Treatment Wetlands 1 through 7 should be 420 ppd.

Historically, the three Enhancement Wetlands (EWs) in conjunction with the chlorine contact basin have been providing year-round supplemental BOD and TSS treatment capacity, despite not being designed for those functions. Solids have been accumulating in the EWs for almost 30 years while percent removal of BOD has been diminishing with time. This phenomenon has been observed and analyzed by both the City and AMRI over the last 10 years. It is suspected that an internal load is increasing due to breakdown of accumulated material, reducing the treatment potential of the EWs. The EWs are designated Waters of the State which are regulated by State Water Board Resolution No. 2008-0026 to protect all waters of the State from dredge and fill activities. The City has indicated that vegetation maintenance and baffle installation will be allowed activities, which

could help with treatment capacity and improvement of short circuiting issues. Current EW BOD treatment capacity is estimated by AMRI to be about 120 ppd, but may decrease in the future without solids removal.

### 4.5.3 Secondary Treatment Capacity Shortfall

The 10 percent growth projection developed in the Draft Facility Plan results in a design influent loading of 4,400 ppd. The design criterion for the existing primary clarifiers is 30 percent BOD removal (1987 Record Drawings). This is also a typical design criteria for new primary clarifiers. This results in an Oxidation Pond influent loading of 3,080 ppd BOD. Subtracting out the anticipated BOD removal in the Oxidation Ponds (1,150 ppd), Treatment Wetlands Nos. 1 through 6 (340 ppd), Enhancement Wetlands (120 ppd), and meeting an Outfall 002 effluent discharge limit goal of 30 mg/L (575 ppd at 2.3 mgd) results in a BOD treatment capacity shortfall of 895 ppd at Outfall 002. Meeting an Outfall 003 effluent discharge goal of 10 mg/L (192 ppd at 2.3 mgd) results in a predicted BOD treatment capacity shortfall of 1,280 ppd at Outfall 003. Note that this capacity shortfall analysis assumes the natural system is performing optimally with routine solids and vegetation maintenance conducted. With deferred maintenance of the natural system over the last 30 years, the predicted BOD treatment capacity shortfall is 1,280 ppd. Future construction of Treatment Wetland No. 7 could reduce the shortfall by 80 ppd and addition of aerators to Pond 2 could reduce the shortfall by approximately 600 ppd, leaving a BOD treatment capacity shortfall of at least 600 ppd at Outfall 003. This analysis is summarized in Table 4.5.

Following this evaluation in the Draft Facility Plan, the City revised its growth estimate to a 20 percent growth projection, which increases the BOD treatment capacity shortfall from 600 ppd to 1000 ppd even with additional Pond 2 aeration and construction of Treatment Wetland No. 7.

Independently, AMRI provided the City an analysis of a secondary treatment capacity shortfall of 1,150 to 2,017 ppd BOD during higher flow and higher BOD loading months of the year, in "AWTF Treatment Capacity Evaluation and Additional Treatment Recommendations," September 2015.

It has been documented that the plant is currently treating the BOD treatment capacity shortfall, inadvertently, by use of chlorine during combined basin operating mode (chlorinating both TW and EW effluents in the Chlorine Contact Basin), which is required about nine months every year (typically during wet weather seasons). Chlorine is a strong oxidizer and typically reduces the organics and BOD level to permit requirements. The City has the ability to increase chlorine dosage as needed. However, disinfection byproducts maybe created from the oxidation reaction, leading to violations of dichlorobromomethane. This is one reason the City has decided to limit the use of chlorine and switch to UV for disinfection.

**Table 4.5 BOD Treatment Capacity Shortfall Summary**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| Unit Process | Estimated BOD Removal (ppd) | Remaining BOD At 10% Growth (ppd) | Remaining BOD At 20% Growth (ppd) |
|---|---|---|---|
| Plant Influent | N/A | 4,400 | 4,800 |
| Primary Clarifiers(1) | 1,320 | 3,080 | 3,480 |
| Oxidation Ponds(2) | 1,150 | 1,930 | 2,330 |
| Treatment Wetlands Nos. 1-6(3) | 340 | 1,590 | 1,990 |
| Enhancement Wetlands(4) | 120 | 1,470 | 1,870 |
| Outfall 003 Discharge Goal @ 10 mg/L | 192 | 1,280 | 1,680 |
| BOD Shortfall | | 1,280 | 1,680 |
| Additional Pond 2 Aeration | 600 | 680 | 1,080 |
| Adding Treatment Wetland No. 7(3) | 80 | 600 | 1,000 |

Notes:
(1) Assumes 30% BOD removal in Primary Clarifiers.
(2) Assumes 25 ppd/acre removal in Oxidation Ponds, at 46 acres total for both ponds.
(3) Assumes 35 ppd/acre removal in Treatment Wetlands, at 9.7 acres in TW 1-6 and 2.3 acres in future TW 7.
(4) Capacity estimated by AMRI based on current removal.

Plant data confirms that the natural system without chlorine generally performs well at lower flow conditions. Figure 4.3 shows a typical example of this, that at a plant influent flow of 1.4 mgd (September 2015), BOD removal was primarily achieved in the oxidation ponds, and TSS removal was primarily achieved in the treatment wetlands. Plant influent BOD at this time was less than 3500 ppd.

Figure 4.4 shows that at plant influent flow of 1.5 mgd when operating in combined basin mode, some BOD removal occurred in the Oxidation Ponds and Treatment Wetlands No. 6, and a significant amount of BOD removal occurred due to chlorination prior to the Enhancement Wetlands. A decrease in 100 mg/L BOD corresponds to 1,250 ppd BOD removal due to chlorination. The City and AMRI analyzed the BOD and chlorine consumption data from 2009 to 2015 and confirmed that during this time while operating in combined basin mode, an average of 730 ppd of BOD removal was achieved by chlorine usage, while peak BOD removal periods could reach 1000 ppd or higher.

In comparison, influent BOD loading in the spring (typically from January through April) is generally greater than 3,500 ppd of BOD. These months also correspond to higher plant influent flows. The higher plant influent loading corresponds to a higher influent loading of the oxidation ponds beyond recommended loading criteria. As shown in Figure 4.5,

Oxidation Pond 1 influent BOD loading from 2010 to 2015 is between 35 and 50 ppd/acre (monthly median). Furthermore, higher flows in the wet weather season (generally October to May) result in reduced treatment capacity in the oxidation ponds and the treatment wetlands due to decreased detention time, shifting additional loading to the enhancement wetlands. As seen in Figure 4.6, BOD loading to the Enhancement Wetlands during the wet weather season has been increasing over the last 25 years. Vegetation growth and solids accumulation in the wetland system over the last 30 years impacts the capacity shortfall.

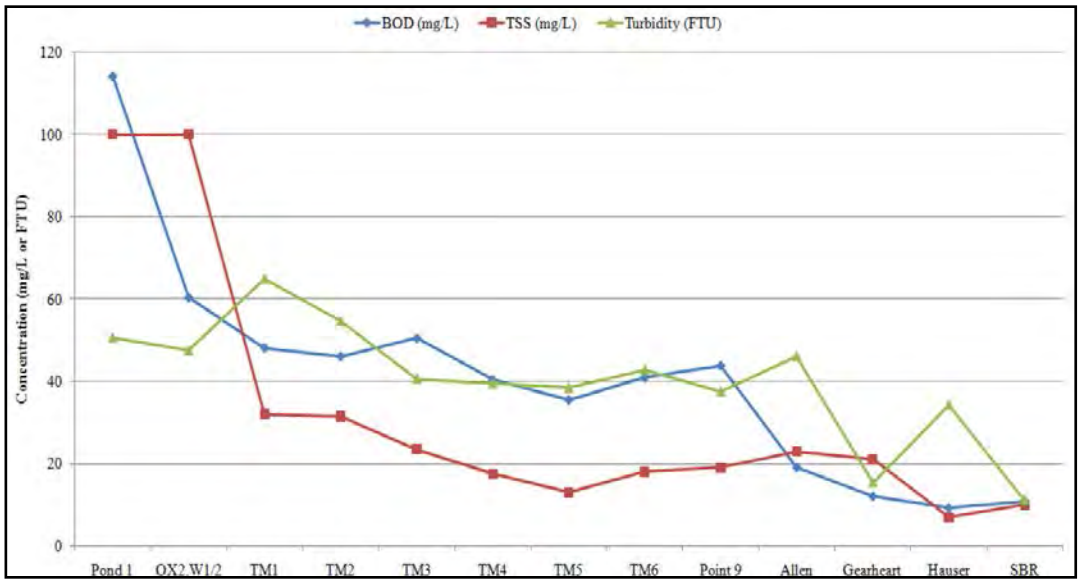

Figure 4.3 Plant Permit Performance At Lower Flows

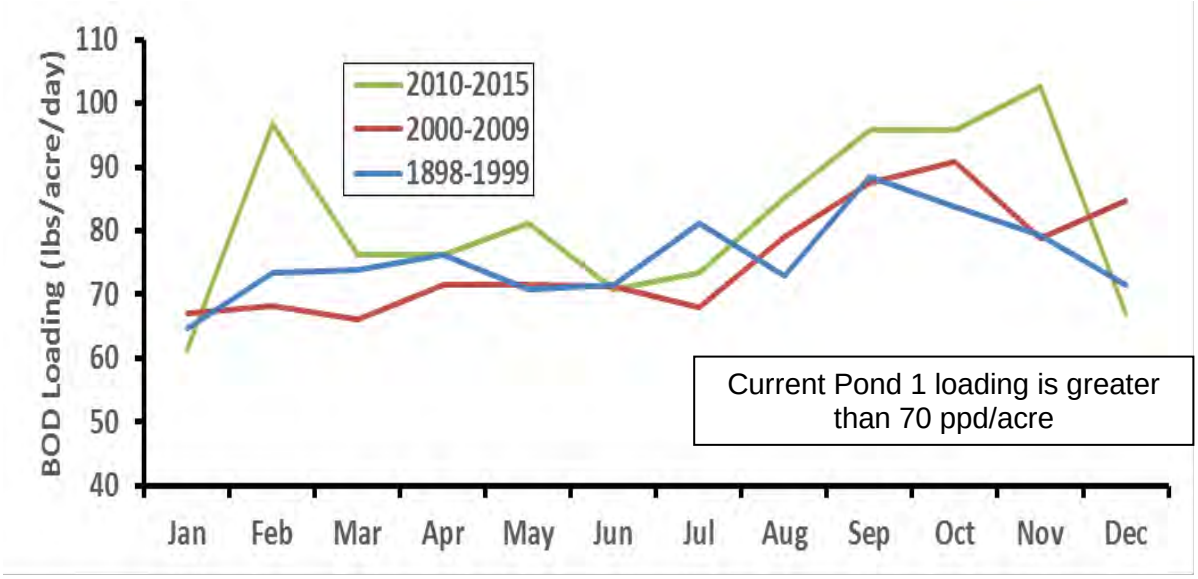

Figure 4.5 Oxidation Pond 1 Influent BOD Loading (Monthly Median)

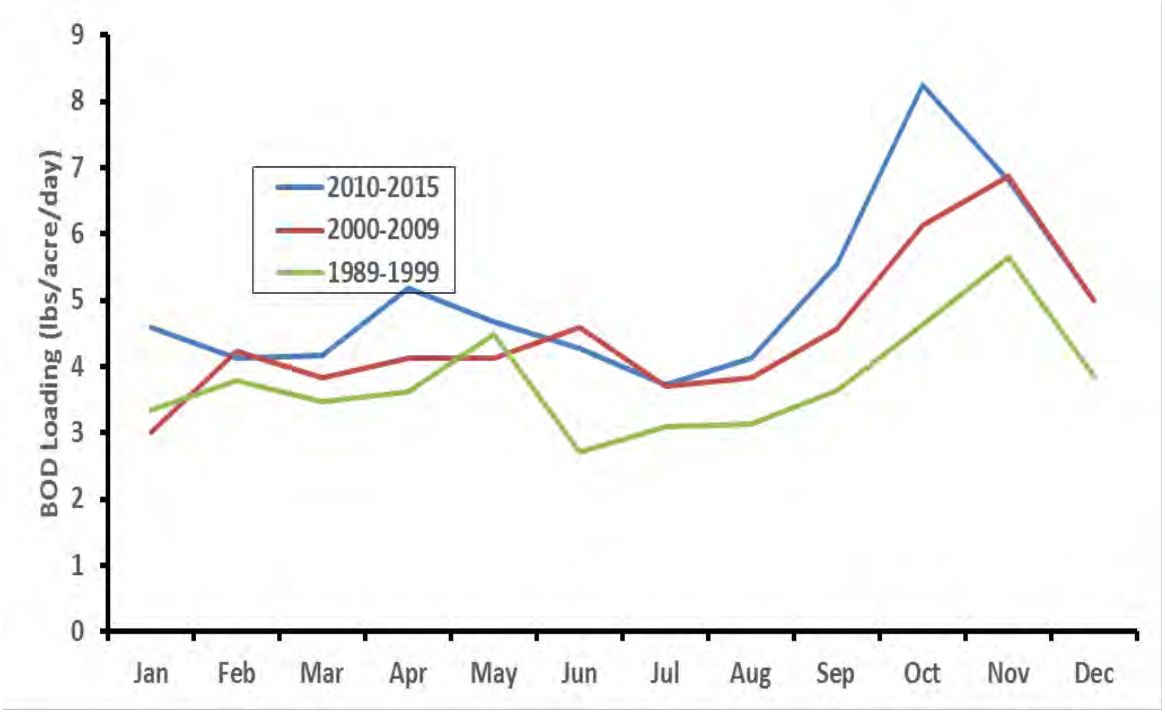

Figure 4.6 Enhancement Wetlands Influent BOD Loading (Monthly Median)

## 4.6 KEY FINDINGS AND RECOMMENDATIONS

The key findings and recommendations from the capacity evaluation include the following:

- **Headworks.** The reliable headworks capacity should be increased to 5.9 mgd to minimize the need to bypass preliminary and primary treatment. The following modifications would be required:
  - Replace the two existing 2.5-mgd screw pumps with two new 5.9-mgd pumps. The pumps could either be replaced in kind or replaced with submersible pumps. Pump selection should be completed during the pre-design phase of the project.
  - Evaluate replacement of the grit chamber with a new vortex grit chamber, which could handle a wider range of flows.
- **Pond and Treatment Wetlands Effluent Pump Stations.** This appears to be an operationally-intensive area of the AWTF, with multiple pump stations and changing weir elevations into and out of the treatment wetlands. Recommend that the treatment wetland pump stations be consolidated in an effort to simplify operations while adding operational flexibility. It is proposed that PS1 be upgraded to pump treatment wetlands flow to enhancement wetlands, with pond pump station remaining for peak wet weather flows.
- **Additional Secondary Treatment.** The BOD treatment capacity shortfall outlined in Table 4.5 needs to be addressed in facility planning and capital improvement program project alternatives. As noted above, addition of aerators in Pond 2 will and addition of Treatment Wetland No. 7 will improve the secondary treatment capacity of the facility, but a deficit of 1000 ppd is still anticipated with a 20 percent growth projection.

Chapter 5

# CONDITION ASSESSMENT

## 5.1 INTRODUCTION

The original Arcata Wastewater Treatment Facility (AWTF) was constructed in the late 1950s. A photo of the original plant is shown in Figure 5.1. The AWTF has been upgraded throughout the years, with the last major upgrade project completed in 1986 (CH2M HILL 1984). The project included a new headworks facility with screening and grit removal, a chlorine contact basin and chemical storage building, effluent pump stations and a new generator building. Since that project, smaller projects have included upgrades to the oxidation ponds, treatment and enhancement wetlands, digesters, pond aerators, and the addition of a standby generator.

Figure 5.1 Original Arcata Wastewater Treatment Plant (Circa 1958)

In May 2015, a condition assessment was performed to assess the current condition of existing structures and equipment and document observations made by plant staff. In general, the plant appears to have been maintained as much as the maintenance budget has allowed. However, findings from the assessment indicate that a majority of the mechanical equipment has exceeded its expected life, and that major structures are also starting to approach the end of their useful life. Finally, plant staff indicated that some capital and maintenance projects had been deferred, pending the outcome of this project. That has meant that staff has struggled to meet permit limits and keep as much of the

existing facilities equipment operational as possible even though it should have been replaced.

## 5.2 PURPOSE

The purpose of the condition assessment is to document the existing facility conditions and help establish priorities for the City's wastewater treatment plant repair and rehabilitation (R&R) capital improvements program (CIP). The findings outlined in this chapter will be incorporated into the CIP presented in Chapter 6.

## 5.3 APPROACH

The approach used to assess the condition of the assets at the AWTF is described in the following sections.

### 5.3.1 Asset Inventory

An "asset" is generally defined as a complete physical component of a facility that enables service to be provided, is critical to plant operation, and/or has a value greater than $10,000. Below-ground assets (process piping) were not evaluated. Above-ground assets include structures, as well as mechanical, electrical, and instrumentation and controls (I&C) equipment and devices.

The AWTF assets were organized into a spreadsheet by unit process. The spreadsheet was configured to provide a complete summary of the asset inventory, including: asset description, design criteria, installation year (if known) and condition ranking. The ranking, estimates of remaining life and replacement costs will be used in Chapter 6 to develop the R&R CIP for the treatment facilities.

The asset inventory was developed using the 1984 CH2M HILL WWTP Modification Drawings (CH2M HILL, 1984), the 2003 Wastewater Treatment Plant Evaluation (SHN 2003) and the City's undated Operations and Maintenance (O&M) manual. The main process areas are shown on Figure 4.1 in Chapter 4.

### 5.3.2 Replacement Timing

#### 5.3.2.1 Original Useful Life

The expected life or Original Useful Life (OUL) is the number of years an asset is expected to be in service as a function of asset type (i.e., mechanical, structural, or electrical). It is used to aid in the determination of the remaining life of an asset. The OUL estimates for different types of assets are presented in Table 5.1.

| Table 5.1 Estimated OUL Based on Asset Category<br>Wastewater Treatment Facility Improvements Project<br>City of Arcata | | |
|---|---|---|
| **Asset Category** | | **Original Useful Life[(1)]** |
| Civil/Sitework | | 50 |
| **Structural** | | |
| | General/Other | 50 |
| | Concrete | 50 |
| | Fiberglass | 25 |
| | Steel | 25 |
| | Plastic | 10 |
| **Mechanical** | | |
| | General/Other | 20 |
| | Valves | 20 |
| | Pumps - Wastewater | 15 |
| | Chemical Equipment | 15 |
| | Coolers/Air Conditioners/Fans | 15 |
| **Electrical** | | |
| | General/Other | 30 |
| | Motor Control Centers | 30 |
| | Variable Frequency Drives | 15 |
| **Instrumentation** | | **10** |

Note:
(1) These values are selected based on a combination of the IIMM, Edition 2006, USEPA guides, other industry references, and Carollo experience.

These OULs were estimated based on industry standard guidelines published by the American Water Works Association (AWWA), the Water Environment Federation (WEF), and the American Society of Civil Engineers (ASCE). The International Infrastructure Management Manual (IIMM) and Carollo's internal discipline-specific experience were also referenced.

#### 5.3.2.2 Condition Scoring System and Remaining Life

The remaining life of an asset is important because this helps determine project prioritization for the development of the R&R CIP. Two factors contributed to the determination of the remaining life of each asset:

- The year of equipment installation.
- Field notes taken during the visual condition assessment.

After the site visit, the assets were evaluated and the condition of each asset was ranked on a one-through-five ranking scale, based on the IIMM. In the IIMM, condition is expressed in terms of the amount of repair needed to bring an asset to like-new condition. The definitions for the one-through-five condition ranking system from the IIMM are shown in Table 5.2. During and after the site assessment, the Carollo/LACO team asked questions and requested additional information regarding maintenance and performance history, documented design criteria, installation date, and typical condition parameters that could be used to standardize the procedure for future assessments. The assessments were visual assessments only and did not include diagnostic testing or entry into confined spaces.

**Table 5.2 Condition Ranking Scale**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| Ranking[1] | Description[1] | Percentage of Asset Requiring Rehabilitation[1][2] |
|---|---|---|
| 1 | Very good condition. | 0% |
| 2 | Good, only minor defects. | 10% |
| 3 | Fair to poor condition, maintenance required to return to accepted level of service. | 20% |
| 4 | Poor, requires rehabilitation. | 40% |
| 5 | Very poor or failed, asset unserviceable. | 90% |

Notes:
(1) Adapted from the International Infrastructure Management Manual. The IIMM manual is produced by a not-for-profit organization in New Zealand that develops asset management best practice publications (See http://www.nams.org.nz/).
(2) "Percentage of asset requiring rehabilitation" is that percentage of the value of the asset needed to return the asset to a condition ranking of one.

Assets that were identified to be in need of replacement within the 20-year planning horizon were incorporated into the asset inventory, which forms the backbone of the R&R CIP. Assets in good condition and that will not need to be replaced within the next 20 years will not be included in the R&R CIP.

## 5.4 VISUAL CONDITION ASSESSMENT RESULTS

The results of the ranking for each process area are summarized in Table 5.3 and outlined in more detail in the descriptions below. Pictures of the main process areas, including structures and equipment, are included in Appendix H, and are used to illustrate the process area ratings. An asset inventory with rankings is in included in Appendix I.

| Table 5.3 Summary of Process Area Rankings<br>Wastewater Treatment Facility Improvements Project<br>City of Arcata | | | |
|---|---|---|---|
| **Process** | **Average Condition - Mech./Elec./I&C** | **Average Condition - Structural** | **Average Remaining Mech./ Structural Useful Life** |
| Headworks | 4 - Poor | 3 - Fair | <5 / 20 |
| Primary Clarifiers | 5 - Very Poor | 5 - Very Poor | <5 / <5 |
| Oxidation Ponds | 5 - Very Poor | 4 - Poor | 10 / 30 |
| Pond Pump station | 4- Poor | 3 - Fair | <5 / 10 |
| Treatment Wetlands 1 to 4 | NA | 4 - Poor | Varies |
| Treatment Wetlands 5 & 6 | NA | 1- Very Good | |
| Pump Station 1 | 4 - Poor | 3 - Fair to 4 Poor | <5 / 20 |
| Enhancement Wetlands | NA | 4 - Poor | Varies |
| Enhancement Wetland PS | 4 - Poor | 4 - Poor | <5 / 10 |
| Chlorine Contact Basin | 2 - Good | 3 - Fair to 4 Poor | 10 / 20 |
| Chemical System | 3 - Fair | 3 - Fair | <10 / 20 |
| Digesters | 3 - Fair | 4 - Poor | 10 / <5 |
| Support Systems | 3 - Fair | NA | <5 / 10 |
| Electrical and Control Systems | 3 - Fair to 4 - Poor | NA | <5 / NA |

### 5.4.1 Headworks

The headworks facility consists of influent pumping, screening, flow measurement, and grit removal. The headworks were constructed in the 1984 project (CH2M HILL 1984). Overall, the headworks are in need of a major upgrade due to the condition of the equipment, which is approximately 30 years old and rated as poor.

#### 5.4.1.1 Influent Pumping

The influent screw pumps were rated as poor to very poor. Although the pumps are operational, they may be close to failure, based on the age, and observed condition. The pumps are open trough, Archimedean screw type units, which have a capacity of 2.5 million gallons per day (mgd) each. Redundancy is provided by a diesel driven bypass pump that can pump from the influent raw sewage wet well directly to the oxidation ponds. In addition, the First Street Pump Station can pump wet weather flows directly to the oxidation ponds.

The influent screw pumps are near or at the end of their life, and will likely require major maintenance if they are not replaced in the near term. For the purposes of this project, it was assumed that the pumps would be replaced with similar units, although the type of pump should be evaluated during predesign. Plant staff has indicated a preference for

submersible pumps, and may be interested in a retrofit for the headworks pumps with submersible units. When the pumps are replaced it is recommended that a redundant pump be provided.

#### 5.4.1.2 Influent Bar Screens

The influent bar screens were rated as poor to very poor and are worn beyond their service life. In addition, the bar spacing is wider than current standards, and will allow stringy rag type material to pass and collect in downstream processes. Like most California facilities, the plant staff is starting to see an increase in disposable baby wipes in the influent flow, which accumulate in the primary clarifiers and digesters, leading to additional maintenance. Each bar screen is sized for the full plant flow and, therefore, has sufficient redundancy. The screening conveyor is worn and has no redundancy.

A screenings washer/compactor was previously installed in order to reduce the water and fecal matter in the screenings. The unit subsequently failed and was removed by plant staff after mechanical failure. The failed unit will need to be replaced in order to achieve the required dry solids and pass the "paint test" required for disposal of the screening material.

#### 5.4.1.3 Flow measurement

The influent flow is measured in a parshall flume using an ultrasonic level sensor. Based on limited observations, the condition of the parshall flume insert is rated as fair. The measurement range of the flume should be verified in future predesign to confirm that it is operational for the range of dry and wet weather flows. The condition of the instrumentation was not observed. The flow measurement was reportedly upgraded prior to the 2003 Plant Evaluation.

#### 5.4.1.4 Grit Removal

The overall grit removal system was rated as poor and the tank was rated as very poor. It consists of a flat bottom, shallow grit separation tank, grit pumps, and a grit cyclone-classifier unit. This type of grit removal tank is no longer recommended and has been replaced in most installations. It generally has poor performance and has limited functionality for plants that experience a wide range of flows, such as the AWTF. It should be replaced during any headworks rehabilitation work. The grit handling system is similar to the equipment that would be specified and provided today. In general, all components have been well maintained, but are beyond their service life, and rated poor to very poor. While the grit pumps have adequate redundancy, they should be replaced. The grit cyclone/classifier was replaced in 2003. It has had major component replacement and appears to be nearing the end of its service life (15 years).

#### 5.4.1.5 Miscellaneous Headworks Components

The miscellaneous headworks components, including gates used for flow isolation and distribution, were rated as poor. They are original and are either at the end of useful life or

have failed. Staff has noted that some gates have failed or are stuck and cannot be operated.

#### 5.4.1.6 Headworks Structure

The headworks structure appeared to be visually in good shape based on the 30-year life and was given a fair rating. Based on review of the original construction drawings, it was noted that the structure is pile supported, and appears to have been designed based on the industry practice and code at that time for design and construction.

#### 5.4.1.7 Headworks Electrical/Controls

The headworks electrical system is fed from a single motor control center A (MCC A) in the generator building. The controls for all equipment were designed to provide monitoring and alarms at the control panel in the operations building. The equipment condition and service life is described further in the Plant Electrical and Controls section below.

### 5.4.2 Primary Clarifiers

The plant has two primary clarifiers:

- Clarifier No. 1: 26-foot diameter unit.
- Clarifier No. 2: 60-foot diameter unit.

Generally, Clarifier No. 2 is used continuously and Clarifier No. 1 is used intermittently for peak wet weather flows. The units seem sufficient for the design flows, although the peak loading rates may result in reduced performance. Overall the units are rated as poor to very poor, especially based on age.

#### 5.4.2.1 Clarifier Mechanism

The age of the clarifier sludge collector mechanism in Clarifier No. 2 is unknown. It appears older and reportedly is in need of major rehabilitation or replacement. The clarifier sludge collector mechanism in Clarifier No. 1 appears newer, and is not used very often, and is therefore in better shape. The drive type and age of each drive is unknown. The coating for the mechanism in unit No. 2 has failed and was reportedly failing in 2002. The Clarifier No. 2 mechanism is rated as very poor. Reportedly a large crack is visible in the center column when the unit is out of service. The Clarifier No. 1 unit is rated as poor due to its observed condition. The structures are rated as very poor based on their age.

#### 5.4.2.2 Sludge Pumping

The primary sludge pumps are progressing cavity type pumps. The age of the primary sludge pumps is unknown. Corrosion was observed on the bases. At least one pump has been rebuilt in the last 10 years. The high pressure shutoff switches on the pumps are functional, but very old. These are rated as fair to poor.

#### 5.4.2.3 Scum Pumps and Scum System

The scum pumps and scum collector/concentrator are approximately 15 years old. They are rated as fair to poor condition.

#### 5.4.2.4 Primary Clarifier Structure

The Clarifier No. 1 structure appears to have been built around 1957 based on records provided by the City that indicate piles for the structure were driven around that time. Clarifier No. 2 was added later, although the date is unknown. Both units are shown in drawings dated 1971. The condition of both units is poor to very poor based on the age, concrete corrosion and cracking of the effluent launders. The walkways and handrail on Clarifier No. 1 do not meet current codes for worker safety. The interior coating on both units has failed and exposed the concrete to sulfide corrosion at the water surface. The structure will need to be replaced when the mechanism is replaced due to age and requirements to meet current building codes.

### 5.4.3 Oxidation Ponds

The oxidation ponds have been in service since the plant was originally put in service in the 1950s. Originally there was one large pond, and later it was subdivided into Ponds 1, 2, and 3. The ponds are shown as one large pond in the 1979 Winzler and Kelly Project (WK, 1979). There is little documentation on pond construction, except that they were formed from native materials, likely using cut and fill construction methods.

The ponds have the following physical characteristics:

- **Pond No. 1.** Average operating depth is 4 to 6 feet, area is approximately 24 acres, and the total volume is 46 million gallons (MG).
- **Pond No. 2.** Average operating depth is 4 to 6 feet, area is approximately 22 acres, and the total volume is 43 MG.

With the exception of effluent pumping and aerators, there is very little equipment in the oxidation ponds. Flow enters Pond No. 1 from the primary clarifiers, and is transferred by gravity to Pond No. 2. The transfer structures are generally overflow structures with only manual weirs. Recently, the transfer structures from Pond No. 2 to treatment wetlands Nos. 5 and 6 have been upgraded with automated weirs that are controlled based on pond level. The oxidation ponds are rated as very poor for mechanical equipment and very poor for structural condition.

The ponds reportedly operate at a depth of 4 to 6 feet. The actual depth and therefore the volume is reportedly impacted by biosolids or sludge accumulation. The amount of sludge in the ponds is difficult to estimate, although the most recent survey indicates that solids range from 6-inches to 3 feet, and average about 10 to 12 inches over the area of the ponds. Since the ponds are fairly shallow, the impact of solids accumulation can be significant. Accumulated sludge in the ponds can lead to degradation of effluent quality,

especially due to pond turn-over events that re-suspend solids in the water, and reduction in pond detention times.

The overall process performance of the oxidation ponds is evaluated elsewhere in this report. The main process concern has been the treatment capacity of this process once the plant is reconfigured to a one pass system. The ponds provide the secondary process for the AWTF, especially biochemical oxygen demand (BOD) removal. The pond treatment process should be evaluated together with the treatment wetlands to ensure that permit requirements can be meet with this process at the design flowrates. Reported issues include potential short circuiting in pond No. 2 from inlet to outlets, low BOD removal from ponds during certain times of the year, and variable pond outlet nitrogen concentrations. In addition, algae production in the ponds contributes to total suspended solids (TSS) increase in the pond effluent.

#### 5.4.3.1 Pond Aerators

Eight mechanical pond aerators are located in Pond No. 1, based on recent satellite photography. Note that the O&M manual mistakenly indicates they are located in Pond No. 2. The aerator controls were upgraded in 2008, when dissolved oxygen control was added to save energy. The existing units are in poor condition, and several have not been used for a number of years.

The 2003 plant evaluation indicated that four aerators were located in Pond No. 1, and several additional aerators were yet to be installed. The overall purpose and use of the aerators should be clarified, since aerator installation can be costly due to the electrical improvements required to support aerator installation.

The aerators are the type with a propeller that creates vacuum and discharges air into the pond surface. These units are inefficient and generally used in ponds that require little aeration, and some mixing. The pond aerators could be replaced with horizontal type units that will improve aeration and mixing. They could be used to create flow patterns that reduce and prevent short circuiting. The location and size of the replacement units can be defined in subsequent predesign work. The condition of the aerator electrical service is not known, although some of the transformers reportedly may need replacement.

#### 5.4.3.2 Pond Pump Station (PPS)

The PPS pulls from Pond No. 2 and discharges to the chlorine contact basin (CCB). It was built as part of the 1984 upgrade project and shares a common wall with Pump Station 1 (PS1), which is discussed later in this chapter. The wet well of the two pump stations can either be separated or combined via an isolation slide gate on the interior wall of the structure. The pump station structure is in fair condition, and has had some corrosion.

The vertical turbine pumps appear to be in poor to very poor condition, and are at the end of their service life. These pumps need to be replaced. The type and size of the replacement pumps should be reviewed during the next predesign phase of work.

The condition of the electrical service for these units and the controls is unknown. It has been suggested that these pumps should be retrofit with variable frequency drives (VFDs) in order to vary the pump speed and capacity and control wet well level.

#### 5.4.3.3 Emergency Pond (2) Pump Station (EPPS)

The EPPS provides for a failsafe operation, and can pump directly from Pond No. 2 to the CCB. The pumps are self-priming centrifugal type units. Staff reported that the emergency pumps and piping were refurbished in 1996 and are rated as fair. The complete scope of the rehabilitation is unknown, but the units appear to be ready for service.

### 5.4.4 Treatment Wetlands

The treatment wetlands (TWs) have very little mechanical equipment or structures. Each wetland has one or two inlet structures, or in one case an inlet pump station, from Pond No. 2. The treatment wetlands were first planted and brought on line at different dates, and therefore are at different levels of maturity. The condition of each wetland is outlined below:

- TW Nos. 1 and 2 were first created by building berms in the 1984 modifications project. Average depth is approximately 4 feet. It is not known when they were planted, but the vegetation in both cells appears mature, very dense and reportedly has become so thick, that most of the vegetation is floating. In addition, these cells were never graded, or leveled, and reportedly the east side of TW No. 1 is deeper. Based on this report and visual observations, the condition is rated as poor to very poor, and is in need of a major vegetation management removal and replanting project. These cells appear to be fed from Pond No. 2 from two inlet structures per TW.
- TW No. 3 was created sometime after 1 and 2, and has fairly dense, floating vegetation. While it is not as dense or overgrown as 1 and 2, it is also rated poor due to the lack of grading and open water for reaeration. It should be scheduled for vegetation management once 1 and 2 have been graded, revegetated, and are back online. This cell is feed from a single inlet structure from Pond No. 2.
- TW No. 4 appears to have been built in the location of the sludge drying beds shown in the 1984 project. This cell is fairly shallow, less than 3 feet, and is fairly densely planted. A portion of this cell has floating plants as well. It is feed from a single pump, located in the eastern TW 1 inlet structure. It has been used as a pilot and demonstration cell over the years. It should be deepened if it is to be used as a treatment wetland. Otherwise it can be maintained as a pilot cell. This wetland was not rated based on it use as a demonstration wetland.

  TW Nos. 5 and 6 were constructed in 2012 from Pond No. 3 (Figure 5.2) and brought online in 2013. These TWs were designed with a series of deep settling zones, followed by intermediate depth zones to be covered by floating wetland plants similar to the other TWs, followed by shallow zones with rooted wetland plants such as bull

rush. The shallow zones help to distribute flow, while the deeper zones allow for some reaeration. The cells are divided using interlocking vinyl sheet piling. The vegetation is fairly dense, but there is some deeper, more open water, less dense areas in the beginning and middle of each cell. These cells are fed directly from Pond No. 2, from single inlet structures. The grading and planting conceptual design is shown in Appendix J, based on correspondence from Dr. Robert Gearheart. These cells are rated as fair to good and should have ongoing vegetation maintenance to maintain this rating.

Figure 5.2 Treatment Wetlands (Circa 1989)

- TW No. 7 has been planned since the creation of TW Nos. 5 and 6. It is recommended that TW No. 7 be constructed fairly soon. Once constructed, it will provide additional treatment capacity and will allow for other cells to be removed from service for replanting.

The overall process performance of the treatment wetlands is evaluated elsewhere in this report. The main process concern has been the hydraulic capacity of this process once the plant is reconfigured to a one pass system, especially at the design flowrates. The process should be evaluated together with the oxidation ponds to ensure that permit requirements can be meet with this process at the design flowrates. Reported treatment issues with the treatment wetlands include short circuiting from inlet to outlet, uneven flow distribution

between treatment wetlands, and low effluent dissolved oxygen levels in conjunction with hydrogen sulfide generation. In addition, some wetland cells may be underperforming compared to others, due to the short circuiting and dense vegetation. The older treatment wetlands 1 to 4 are rated as poor due to deferred maintenance and inconsistent configuration, and treatment wetlands 5 and 6 are rated as very good based on the recent construction.

#### 5.4.4.1 Pump Station 1

Pump Station No. 1 (PS1) receives flow from TW Nos. 1 through 4 and discharges to the CCB. It was constructed as part of the 1984 project. The equipment in the pump station was rated as poor and the structure as fair to poor. The vertical turbine type pumps are at the end of their life and need to be replaced. These could possibly be replaced with submersible type pumps, which can be evaluated during the predesign stage of the project.

The condition of the structural and electrical is unknown. Currently the pumps operate in an off/on mode, based on level, with a lead lag and standby pumps. Two of the pumps have VFDs in order to vary the pump speed and capacity to control wet well level.

#### 5.4.4.2 Pump Station 2

Pump Station No. 2 (PS2) receives flow from TW Nos. 5 and 6 and was originally constructed to discharge directly to the CCB, but are now redirected back to Junction Box 1 which conveys flow to Pump Station 1. This pump station was originally constructed in 1990s by City staff to serve Oxidation Pond 3 storm flows and then repurposed for TW Nos. 5 and 6 in 2012. Therefore, the pumps are older and maybe at the end of their life. Pump station hydraulics should be reviewed during predesign to confirm the capacity still matches the required capacity, since the flow has been redirected. Reportedly the pump station is shallow and would need to be deeper in order to handle design gravity wet weather flows flow from the wetlands. The structure was completed by plant staff, and is not pile supported as required. The pumps are rated as poor and the structure as poor to failed.

The condition of the structural and electrical is unknown. Based on the O&M manual these pumps have VFDs and can be controlled to maintain wet well level.

#### 5.4.4.3 Inlet and Outlet Structures

The condition of the inlet and outlet structures for the TWs was reviewed briefly during the site inspection. They appear to be in fair condition given their age.

### 5.4.5 Enhancement Wetlands

The enhancement wetlands are the main feature of the Arcata Marsh and Wildlife Sanctuary (AMWS). The AMWS consists of three freshwater wetlands: Allen, Gearheart, and Hauser enhancement marshes or wetlands. The wetlands receive treatment wetlands effluent that is regulated to be equivalent to a secondary treated wastewater effluent. The

wetlands provide polishing of the treatment wetlands effluent while providing habitat for a diverse number of organisms, and recreation opportunities.

#### 5.4.5.1 Enhancement Wetlands

The enhancement wetlands (EWs) were constructed from native materials in much the same manner as the TWs. They operate in series, connected by a series of effluent lines, with inlet and outlet structures. The EWs were not surveyed in detail for this report, but previous reports were reviewed to determine if there were any improvements that had been identified for the wetland operation. The main feature noted was the potential for short circuiting, based on the vegetation and construction of channels that may lead to reduced detention time. Therefore the EWs are rated as poor, and improvements that maximize the hydraulic detention time are included in the capital improvement program.

The overall process performance of the enhancement wetlands is evaluated elsewhere in this report. The main process concern has been the hydraulic capacity of this process once the plant is reconfigured to a one pass system, especially at the design flowrates. The process should be evaluated together with the treatment wetlands to ensure that permit requirements can be meet with this process at the design flowrates. Reported treatment issues with the enhancement wetlands include short circuiting from inlet to outlet and low effluent dissolved oxygen levels in conjunction with hydrogen sulfide generation. In addition, algae production in the wetlands may contribute to TSS increase in the enhancement wetland effluent. Therefore they are rated at fair to poor based on deferred maintenance, flow short circuiting, and transfer structure issues.

#### 5.4.5.2 Enhancement Wetlands Effluent (Hauser) Pump Station

The Enhancement Wetlands Pump Station (EWPS) or Hauser PS was constructed as part of the 1984 plant modifications. It consists of three vertical turbine pumps located in a concealed wet well in the public access area of the AMWS. The pumps were rated as poor and will need to be replaced to provide the capacity for the new flow configuration. The use of the existing wet well will be further reviewed as part of the preliminary design for the UV disinfection and flow reconfiguration project.

In general the structure appears to be in fair to poor condition based on the age. The structure is pile supported, and does not appear to have any settlement issues. The way the pumps were concealed makes the PS maintenance difficult, and contributes to the poor rating. Three large hatches were placed over the vertical turbine pumps, so they could be removed, but the space is a confined space with limited access. Other types of pumps including submersible type might be considered to allow for ease of maintenance, and to reduce the access issues.

The pump station intake or inlet structure includes two inlets that draw at different elevations from the Hauser wetland. One inlet is clogged and has not worked for over a decade. These combine in an inlet box into a single inlet line into the PS wet well. The 16-

inch inlet lines will need to be checked to confirm they provide the required capacity for the flow reconfiguration. The inlet structure is also pile supported. Plant staff has added a manual coarse screen in the outlet from the box to remove larger debris before it enters the wet well. The need for an automated screen will be reviewed in predesign.

The PS discharges to the existing CCB, for disinfection prior to discharge at Outfall 001. The piping will be retained for future diversion to the existing outfall if needed. New piping and valves will be added to allow discharge to the new UV disinfection facility and then gravity flow to Outfall 003.

### 5.4.6 Disinfection

The existing disinfection system consists of the CCB, chlorine storage and feed building and associated equipment. The system was constructed in the 1984 improvements project. The conditions of the major elements are outlined below.

#### 5.4.6.1 CCB

The CCB consists of two 4-pass basins that can be operated in series or combined modes. The basin is a pile supported, cast in place concrete structure with concrete masonry block divider walls. The structure condition appeared to be fair to poor based on the age of construction, and the divider wall construction. The divider walls are reinforced grout filled walls that may not have structural capacity for a seismic event. The handrail was observed to be in good condition. The condition of the isolation gates and appurtenances is poor with some gates that are difficult to operate. The chemical induction mixers and mechanical equipment are nearly 20 years old and rated as fair.

#### 5.4.6.2 Chemical Storage and Feed Facilities

The disinfection chemical storage and feed system is based on ton cylinder liquid chlorine (CL2) and sulfur dioxide (SO2) tanks. The tanks are connected in parallel to provide sufficient capacity. The condition of the system was not assessed in detail since it was assumed it would be phased out, or operated intermittently once the new UV system was implemented. It was noted that the current ton cylinder storage building was in fairly good shape, and might be repurposed for other uses once the system is off-line. It could be used for a liquid chemical system. It consists of a pile supported slab with CMU walls, and fairly tall peaked roof open building structure.

#### 5.4.6.3 Miscellaneous Chlorine Disinfection Facilities

The miscellaneous facilities and their condition are noted below:

- Chemical residual analyzers - fair condition.
- CCB sample pumps replaced on a regular basis using disposable units - fair condition.

- CCB gates - poor condition.
- Chlorine and Sulfur dioxide induction mixers are newer and are rated as good.

## 5.4.7 Solids Handling and Treatment

The solids handling and treatment facilities include primary and secondary digesters; digester mixing and heating facilities; sludge drying beds and compost operation; and digester gas handling. The condition of these facilities is outlined below.

### 5.4.7.1 Digesters Structure

The digesters were constructed as part of the original plant in the late 1950s. The primary digester was upgraded in the 1984 project, including increasing the overall height. Floating gas holder roofs were added at that time as well. The condition of the digester structure appears to be poor, although they have not been inspected by a structural engineer. The condition of the dome roof is unknown, but it is known that has been inspected and the exterior recoated as some point. The condition of the covers interior was not observed, although the 2003 plant evaluation also recommended an inspection and coating if required. Due to the lack of redundancy, this inspection may be difficult, and therefore has been put off by plant staff.

Staff noted that the digesters have been cleaned recently, in both 2002 and 2014. No reports were available on the condition of the digesters once they were cleaned.

### 5.4.7.2 Digester Mixing and Heating

The heating and mixing system for Digester No. 1 was upgraded in 2002 (Rotamix nozzles) and in 2013 (new mixing nozzles and mixing / recirculation pumps). The condition of this equipment appears to be good to fair. The boiler was reportedly replaced in 1998 or 1999. Issues with the existing digester gas piping were noted in the 2003 plant evaluation, and should be confirmed.

### 5.4.7.3 Sludge Drying Beds

The sludge drying beds were built as part of the 1984 project. These beds were covered with a canopy type roof. The condition of these original drying beds was rated as fair. Plant staff noted that additional drying beds could be used, or replaced with mechanical dewatering equipment.

#### 5.4.7.4 Compost Operation

The components of the sludge and green waste compost process were not reviewed during the condition assessment and plant site walk.

### 5.4.8 Plant Electrical and Controls

The plant electrical and control systems are generally in fair to poor shape due the age of the equipment. Reportedly buried conduit has deteriorated in many locations, and now is just bare wire. Reportedly, the wire and cabling is need of replacement as well. The majority of the electrical equipment and control systems are the original equipment installed as part of the 1984 project.

The plant control system is outdated and does not provide some of the current labor saving features that are found in almost all systems today. These include:

- Remote operation. Currently, most equipment must be controlled at the process area only, and little if any equipment may be remotely operated.
- Remote access. This would allow alarm conditions to be reviewed by the facility manager without having to visit the plant.
- Data collection and logging. This would aid in monthly reporting and maintenance planning.
- Compatibility with new controls. Currently, new equipment with programmable logic controller (PLC) based controls cannot be integrated into the existing system.
- The system does not have the ability to integrate the collection system monitoring and control systems.

The rating of the major system components is noted below:

- Power Distribution - The MCC equipment was installed in the 1984 project, and is mostly original. The main plant MCC equipment is located in the standby generator building. The equipment including MCCs and transfer switch is in fair condition.
- Standby Generator - The plant main standby generator was replaced by staff in a recent in-house project. The installation looks good, and is reportedly working well. The unit is 250-kW. The new unit is in good condition. An older, smaller, 150-kW unit is available as a backup, although its condition is unknown.
- Plant power feed - The condition of the plant power feeder from the utility was not reviewed, although plant staff has noted the main transformer is old. Staff reportedly tests the oil in each transformer in order to anticipate transformer failure and replacement needs.

## 5.5 SUMMARY OF PLANT CONDITIONS

Overall the plant assets and equipment is in fair to poor condition. While this will not be a surprise to plant and City staff, it does indicate a need to complete a comprehensive update the existing capital improvement plan to bring the assets into better ratings. Therefore, in addition to the current project to meet the conditions of the discharge permit, ongoing projects will be required to rehabilitate the aging infrastructure and maintain the ability to meet permit requirements. The recommended CIP is provided as Chapter 6.

# ALTERNATIVES

## 6.1 INTRODUCTION

Based on the findings of the previous chapters, there is a need to develop and evaluate alternatives that meet current and future treatment objectives and permit compliance requirements. Drivers for these alternatives include:

- Current permit requirements (new flow configuration with enhancement requirement and UV implementation).
- Ongoing permit violations.
- Need to repair/rehabilitate aging infrastructure.
- Deferred maintenance of the existing ponds and wetlands system including build-up of solids and materials causing an internal load.
- Identified shortfall in secondary treatment capacity with elimination of chlorine.
- Future regulations on ammonia/nutrients.
- Future sea level rise and flooding concerns.

This chapter describes the project options considered and the methodology for selection of recommended alternatives that best meet the multiple goals of the City.

## 6.2 BASIS FOR ALTERNATIVES

The design flow and loads were determined in Chapter 2 and are shown in Table 6.1. These loads include a 20 percent growth factor over existing 90th percentile loads. This allows for confidence in sizing facilities to be able to meet permit requirements in most conditions that will be seen by the Arcata Wastewater Treatment Facility (AWTF).

All alternatives should provide reliable treatment capacity for design load, provide flexibility to meet future regulatory requirements (such as ammonia removal), and must be able to fit on the existing site since additional bay fill is not permitted and additional land is not available near the AWTF. Furthermore, as discussed in the June 27, 2016 meeting with the RWQCB, the Enclosed Bays and Estuaries Policy requires effluent enhancement prior to discharge; bypassing enhancement is no longer acceptable based on current permit requirements.

It is recognized that the existing natural land based system is a point of pride in the community and heralded as a model of sustainable, land-based treatment. Therefore, it is desirable to continue using the pond and wetland system to the best of their abilities and to

improve them through solids removal and vegetation management to increase their reliability.

| **Table 6.1 Design Flow and Loads With 20% Growth Projection Wastewater Treatment Facility Improvements Project City of Arcata** | |
|---|---|
| Average Dry Weather Design Flow, mgd | 2.3 |
| Peak Wet Weather Design Flow, mgd | 5.9 |
| Design Influent $BOD_5$ Load, ppd | 4,800 |
| Design Influent TSS Load, ppd | 6,910 |
| Design Influent Ammonia Load, ppd | 1,060 |

## 6.3 SUMMARY OF COMMON IMPROVEMENTS NEEDED

Based on the findings of Chapter 5, Condition Assessment, numerous facilities will need to be improved based on their expected useful life and current condition. In addition, there are many common elements needed for the new flow configuration. Common elements for all alternatives include:

- **Headworks Improvements**: The headworks are currently rated at 5.0 million gallons per day (mgd) and the visual condition assessment rated the average mechanical, electrical and I&C condition as poor. The recommended headworks improvement is to replace structural and mechanical assets due to age and condition, and to upsize the capacity to handle design peak wet weather flow (PWWF) of 5.9 mgd. Replacing the headworks structure will also raise the hydraulic grade line at the start of the plant, allowing downstream facilities to flow by gravity and minimizing the need for additional pumping.

- **Primary Clarifiers**: The two primary clarifiers are currently rated at 4.0 mgd and 1.0 mgd each, and the condition assessment rated the mechanical, structural, electrical and I&C condition as very poor, especially based on their age. The recommended improvement is to replace structural and mechanical assets due to age and condition. The capacity of the primary clarifiers will vary depending on the project alternative requirements.

- **Primary Sludge and Scum Pumps**: The age of the primary sludge pumps are unknown and the scum pumps are 15 years old. Visual condition assessment rated the average mechanical, electrical and I&C condition as fair to poor. The recommended improvement is to replace the primary sludge and scum pumps due to condition along with the primary clarifiers. The capacity of the primary sludge and scum pumps will vary depending on the project alternative requirements.

- **Oxidation Pond Nos. 1 and 2 Solids Removal and Transfer Structure Reconfiguration**: Solids accumulation in the oxidation ponds is affecting treatment and hydraulic capacity. Up to one foot of solids in each pond is anticipated needing dredging, dewatering, and disposal in order to return the ponds to original design intent. Reconfiguration of the pond transfer structures is recommended for better flow distribution and improvement of storage capacity.

- **Emergency Pond Pump Station**: The existing pump station has a firm capacity of 3.6 mgd and pumps peak wet weather flows above 5.9 mgd from Oxidation Pond No. 2 to the chlorine contact basin, for discharge through Outfall 001. Plant staff reported that the pumps are older, but in good condition due to low operating hours. Recommended improvements include adding suction and discharge piping to allow the pump station to pump out of Pond 1 and into Pond 2 for Pond 1 storage control; pump rehabilitation is not anticipated to be needed.

- **Treatment Wetland Nos. 1 through 4 Solids and Vegetation Maintenance**: Solids accumulation and heavy vegetation growth in Treatment Wetland Nos. 1 through 4 is affecting treatment and hydraulic capacity. Solids and vegetation removal, regrading of the deep and shallow water zones, and vegetation replanting is anticipated in the four older treatment wetlands in order to return them to original design intent. No maintenance project is currently planned in Treatment Wetland Nos. 5 and 6 due to their recent construction. Treatment Wetland No. 4 will require substantial regrading to deepen and provide the same capacity as the other treatment wetlands.

- **Treatment Wetland No. 4 Influent Pumps and Treatment Wetlands Pump Station 2**: These pumps will need to be further evaluated during preliminary design to determine whether pump replacement is required or whether pumps can be demolished with rehabilitation of the other treatment wetlands improvements.

- **Enhancement Wetlands Improvements:** Solids accumulation and heavy vegetation growth in the enhancement wetlands is affecting treatment and hydraulic capacity. As Waters of the State, major regrading or any activities that significantly reduce water quality or habitat will not be allowed in the enhancement wetlands. Vegetation maintenance, new baffles, and new inlet/outlet structures is anticipated in all three enhancement wetlands in order to improve treatment and hydraulic efficiency and capacity.

- **Pond Pump Station/Pump Station 1**: Pond Pump Station has an existing firm capacity of 2.9 mgd and Pump Station 1 (Treatment Wetland PS) has an existing firm capacity of 2.3 mgd. The visual condition assessment of both pump stations rated the average mechanical, electrical and I&C condition as poor (score of 4), and structural condition as fair to poor (score of 3 and 4). The recommended improvement is to replace mechanical assets due to age and condition and to upgrade the combined

wet well in order to improve flow by gravity upstream. The new capacity of each pump station will vary depending on the project alternative requirements.

- **Enhancement Wetlands (Hauser) Pump Station:** Enhancement Wetlands Pump Station originally had a firm capacity of 3.0 mgd, but recent pump capacity tests have derated the capacity to 1.2 mgd. The visual condition assessment of both pump stations rated the average structural, mechanical, electrical and I&C condition as poor (score of 4). The recommended improvement is to replace mechanical assets due to age and condition. The new capacity of the pump station and capacity of the discharge pipe to the new UV system will vary depending on the project alternative requirements. In general, it is agreed by the City, AMRI, and Carollo that the Enhancement Wetlands will perform best at steady lower flows. Holding the flow to 2.3 mgd for Alternatives 1, 2 and 3 was recommended. However this should be considered again during preliminary design given the RWQCB position (stated at the 6/27/16 meeting) that all flow must pass through the enhancement wetlands to meet the definition of enhancement. Further inspection of the existing 16-inch pump station discharge piping during Preliminary Design is also recommended to confirm condition and any rehabilitation required. Based on the most recent alternative (No. 4), it is recommended that the pump station be sized for up to 5.9 mgd.

- **Anaerobic Digesters and Sludge Heating/Mixing System**: The two anaerobic digesters are almost 60 years old. The external visual condition assessment rated the average structural condition as fair but the internal structural condition is unknown. The sludge heating and mixing system appears to be in good to fair condition. The recommended improvement is to improve structural and mechanical assets in phases. The required project elements and recommended implementation schedule will vary depending on the project alternative requirements.

- **Outfall 003**: New Outfall 003 at the Brackish Marsh and effluent piping from the UV disinfection system will be sized for 5.9 mgd.

- **UV Disinfection:** A new UV disinfection system will be constructed for disinfection of secondary effluent up to 5.9 mgd. The design criteria of the UV system will vary depending on the project alternative requirements. UV disinfection is further discussed in Chapter 7, Disinfection Alternatives.

## 6.4 IDENTIFICATION OF SECONDARY TREATMENT OPTIONS

Identification of secondary treatment options is needed to address the secondary treatment capacity shortfall. This task was completed in phases. The first phase consists of a preliminary screening of new secondary treatment options to be used in conjunction with the existing natural system for pretreatment, parallel treatment, or post treatment. Any of these treatment options deemed feasible were further discussed and evaluated with the City.

### 6.4.1 Preliminary Screening of Secondary Treatment Options

There are several treatment processes that can be used to provide additional secondary treatment capacity, either alone or in combination with other processes, in order to achieve desired effluent water quality. Table 6.2 provides a list of secondary treatment processes that are commonly considered, along with the constituents they most commonly remove.

**Table 6.2 Secondary Processes Meeting Permit Discharge Requirements Wastewater Treatment Facility Improvements Project City of Arcata**

| Process | Ability To Remove | | |
|---|---|---|---|
| | Organics (BOD)[1] | Ammonia[2] | Total Nitrogen[2] |
| **Suspended Growth** | | | |
| Activated Sludge | √ | √ | √ |
| **Attached Growth** | | | |
| Trickling Filters | √ | | |
| Nitrifying Trickling Filters | | √ | |
| Denitrification Filters | | | √ |
| **Land Based Systems** | | | |
| Ponds (Aerated or Not) | √ | Summer only | |
| Vegetated Wetlands | √ | limited | If nitrified before |
| Open Water Wetlands | √ | Some | If nitrified before |

Notes:
(1) Current permit discharge requirement.
(2) Anticipated future permit discharge requirement.

While there are variations of activated sludge processed such as oxidation ditch, conventional activated sludge, sequencing batch reactors, or a membrane bioreactor that adds a membrane filter, the biological treatment process is the same. Similarly, there are various attached growth processes that incorporate different types of media that the biological growth attaches to, but the treatment process is essentially the same.

In addition to the secondary processes presented above, there are some physical and chemical processes that could be considered. There are several approaches that could be taken with any additional treatment process: 1) pre-secondary treatment (pretreatment) by adding processes before the existing pond/wetlands system, 2) parallel secondary treatment, and 3) post-secondary treatment (post treatment, after the pond/wetlands). Each alternative considered needs to fit with a final UV disinfection step, as the City Council has affirmed several times the decision to move away from chlorine and instead use UV. Initial options that fall into each of these categories are shown in Table 6.3.

Of the options considered, there are only a few that Carollo recommends carrying forward for a variety of reasons, as discussed below. Any process that requires piloting at the

AWTF was eliminated to meet the accelerated schedule for permit compliance. Any process that is not yet a proven technology with full-scale installation experience was also eliminated early in the alternatives analysis.

**Table 6.3 Initial Screening of Pre, Parallel and Post Treatment Options Wastewater Treatment Facility Improvements Project City of Arcata**

| | Treatment Option | Adds BOD Capacity | Removes Ammonia | Improves Final UVT | Reliable | Move Forward |
|---|---|---|---|---|---|---|
| Pretreatment | Chemically Enhanced Primary | < 400 ppd | No | No | Yes | No - high O&M cost |
| | Aeration | yes | limited | No | Yes | Yes |
| | Trickling Filter | yes | only if 2-stage | No | Yes | No |
| | Activated Sludge | Yes | Yes | No - TM degrades | Yes | No |
| Parallel | Additional Ponds/Wetlands | Yes | Summer only | No | Maybe | No - no room |
| | Rehabilitate Ponds/Wetlands | Yes - not enough | Summer only | No | Maybe | Yes |
| | Trickling Filter | Yes | only if 2-stage | No | Yes | Yes |
| | Activated Sludge | Yes | Yes | Yes | Yes | Yes |
| Post Treatment | Trickling Filter/Nitrifying Trickling filter | Yes | only if 2-stage | No | No - cold affects performance | No - not as flexible |
| | Submerged Biofilter | Not proven | Need to pilot | No | Unknown | No |
| | Ozone/Biological active Filtration | Yes | Maybe - must pilot | Not needed | Maybe - must pilot | No -Need to pilot |
| | Filtration | < 400 ppd | No | Maybe | Yes | No -Need to pilot |

Pretreatment:

- Chemical pretreatment in the primaries would add a significant operations cost with only an additional 10 percent removal of BOD across the primaries, which does not meet the shortfall.
- The existing Pond 1 aerators could remove BOD if they were functioning and designed for the appropriate conditions (e.g. pond depth, location). In the new flow routing, Pond 1 will be used for both treatment and storage at peak wet weather flows. Therefore, the use of aerators in Pond 1 is not recommended due to variable operating depth. Pond 2 will be used for only treatment, and thus adding aerators to Pond 2 will be considered.

- Trickling filters, while a proven and effective treatment process, are poor processes upstream of UV, and do not have the flexibility to remove ammonia or nitrogen unless more than one unit is installed in series.
- Activated sludge upstream of the existing natural system would improve water quality, but to be most effective as pretreatment it would have to be sized for the full flow which would require a high O&M cost due to aeration requirements. One disadvantage is that improved UV Transmittance (UVT) from activated sludge effluent would degrade across the existing natural system.

Parallel Treatment:

- Additional ponds or wetlands could provide the needed BOD treatment; however, land is not available for building new ponds or wetlands sufficient to meet the capacity shortfall. As Waters of the State, the AMWS cannot be modified to function as treatment wetlands since significant regrading would be required to create alternating deep and vegetated zones. Additional ponds or wetlands would not provide year-round ammonia or nitrogen removal, since the natural removal process is dependent on temperature and sunlight.
- Trickling filters, while a proven and effective treatment process, are poor processes upstream of UV, and do not have the flexibility to remove ammonia or nitrogen unless put in series. However they were carried through the initial screening.
- Activated Sludge processes provide both BOD and ammonia/nutrient removal and provide the most flexibility for additional treatment. As parallel treatment the process could be sized for a portion of the full flow which would reduce O&M cost due to aeration requirements.

Post Treatment:

- A weakness of any attached growth process (trickling filters or nitrifying trickling filters) is that they are sensitive to temperature. If the ponds and wetlands are located upstream of an attached growth process, the system will have unreliable performance in the winter months. Additionally, ammonia removal in attached growth processes has been shown to be difficult following ponds and wetlands (e.g. City of Stockton). In the summer months while ponds are reducing ammonia, the biological organisms are being starved, leading to violations in the fall when additional treatment is needed. Additionally, lightly loaded trickling filters (e.g. nitrifying trickling filters) are prone to attracting snails that strip the biological process from the media. Additional operations expenses are required to control the snails.
- A submerged biofilter is another attached growth process that was considered. However, it is our opinion that the same ammonia starving issue that happens with nitrifying trickling filters and potential poor performance in the cold months will likely happen with submerged biofilters.

- Biological active filtration paired with ozone has shown the ability to produce high quality water. However, it is unknown how such a process would perform on pond/wetland effluent. This process would require piloting. From experience at other installations, the process can be fairly expensive. In addition, the use of ozone requires special operation training and attention. Therefore, this alternative is not considered further.
- Filtration is a common process to add after secondary treatment to produce a high quality water. However, filtration following pond/wetland processes has been shown to be more difficult, requiring much lower loading rates (more filters) and high chemical (coagulant) doses in Cities of Napa, Sunnyvale, and Stockton. Additionally, it is only likely to reduce BOD by approximately 20 milligrams per liter (mg/L) or less than 400 ppd. Pilot testing would be required to determine the UVT after filtration as well as the acceptable filter loading rate and coagulant dose.

Summary of Initial Screening:

- The viable pretreatment alternative to be further considered is aeration in Pond 2.
- The viable parallel treatment alternatives to be further considered are rehabilitation of the ponds/wetlands, trickling filters, and activated sludge.
- None of the post treatment alternatives will be further considered.

### 6.4.2 Further Screening of Parallel Secondary Treatment Options

At the November 5 and 6, 2015 facility plan capacity workshop with the City staff and City consultant Bob Gearheart (with AMRI), a more detailed analysis of parallel secondary treatment options was discussed, including:

- Conventional activated sludge (CAS) aeration basins.
- Extended aeration activated sludge (oxidation ditch).
- Trickling filters.
- Modifying existing oxidation ponds to a Biolac system or aerated lagoons.

As discussed at the workshop, modifying the existing oxidation ponds to a Biolac system or aerated lagoons was deemed not feasible due to constructability issues with the berms and pond depths. For workshop discussion purposes, preliminary design criteria were presented for the remainder of the options in order to present comparative information. Hence, preliminary design criteria were developed based on flow design criteria shown in Table 6.4. These preliminary design criteria are outlined in Table 6.4. Note that following the November 2015 workshop, additional City flow and load data was provided to Carollo in order to further refine the load design criteria to the values presented in Table 6.4.

During the November 2015 workshop, discussion of the treatment options included a number of considerations including performance, footprint, constructability, operation and maintenance requirements, and economic factors. A summary of the non-economic

evaluation is outlined in Table 6.5. A summary of the economic evaluation is outlined in Table 6.6. At the workshop, the preferred secondary treatment process selected by the City was an extended aeration oxidation ditch. The information presented in the workshop is included in Appendix G.

**Table 6.4 Preliminary Design Criteria for Parallel Secondary Treatment Options Wastewater Treatment Facility Improvements Project City of Arcata**

| Item | Option | | |
|---|---|---|---|
| | Conventional Activated Sludge | Oxidation Ditch | Trickling Filters |
| Primary Clarifiers - Quantity & Diameter(1) | 2 @ 40 ft | N/A | 2 @ 40 ft |
| Aeration Basins - Quantity & Volume | 2 @ 0.23 MG | 2 @ 1.44 MG | N/A |
| Trickling Filters - Quantity, Height & Diameter | N/A | N/A | 2 @ 20 ft high, 60 ft diameter |
| Secondary Clarifiers - Quantity & Diameter | 2 @ 70 ft | 2 @ 70 ft | 2 @ 70 ft |
| Effluent BOD (mg/L) | 10 | 20 | 30 |
| Effluent TSS (mg/L) | 10 | 20 | 30 |
| Effluent Ammonia (mg/L) | Same as influent(2) | <1 | Same as influent(2) |

Notes:

(1) Primary clarifiers are not a required process upstream of the oxidation ditch alternative; however, they may be recommended with project alternatives depending on flow configuration requirements.

(2) In this analysis, additional volume for nitrification was not included with CAS or trickling filters; nitrification in an oxidation ditch can be achieved without additional volume.

**Table 6.5 Secondary Treatment Options Evaluation of Non-Economic Factors Wastewater Treatment Facility Improvements Project City of Arcata**

| Option | Criteria Scale: 1 (least favorable) to 3 (most favorable) | | | | | |
|---|---|---|---|---|---|---|
| | Safety | Meets Permit | Ease of O&M | Construct -ability | Reliability | Ammonia Removal |
| Conventional Activated Sludge | 2 | 3 | 1 | 3 | 3 | 2 |
| Extended Aeration – Oxidation Ditch | 2 | 3 | 3 | 2 | 3 | 3 |
| Trickling Filters | 3 | 1 | 3 | 2 | 1 | 1 |

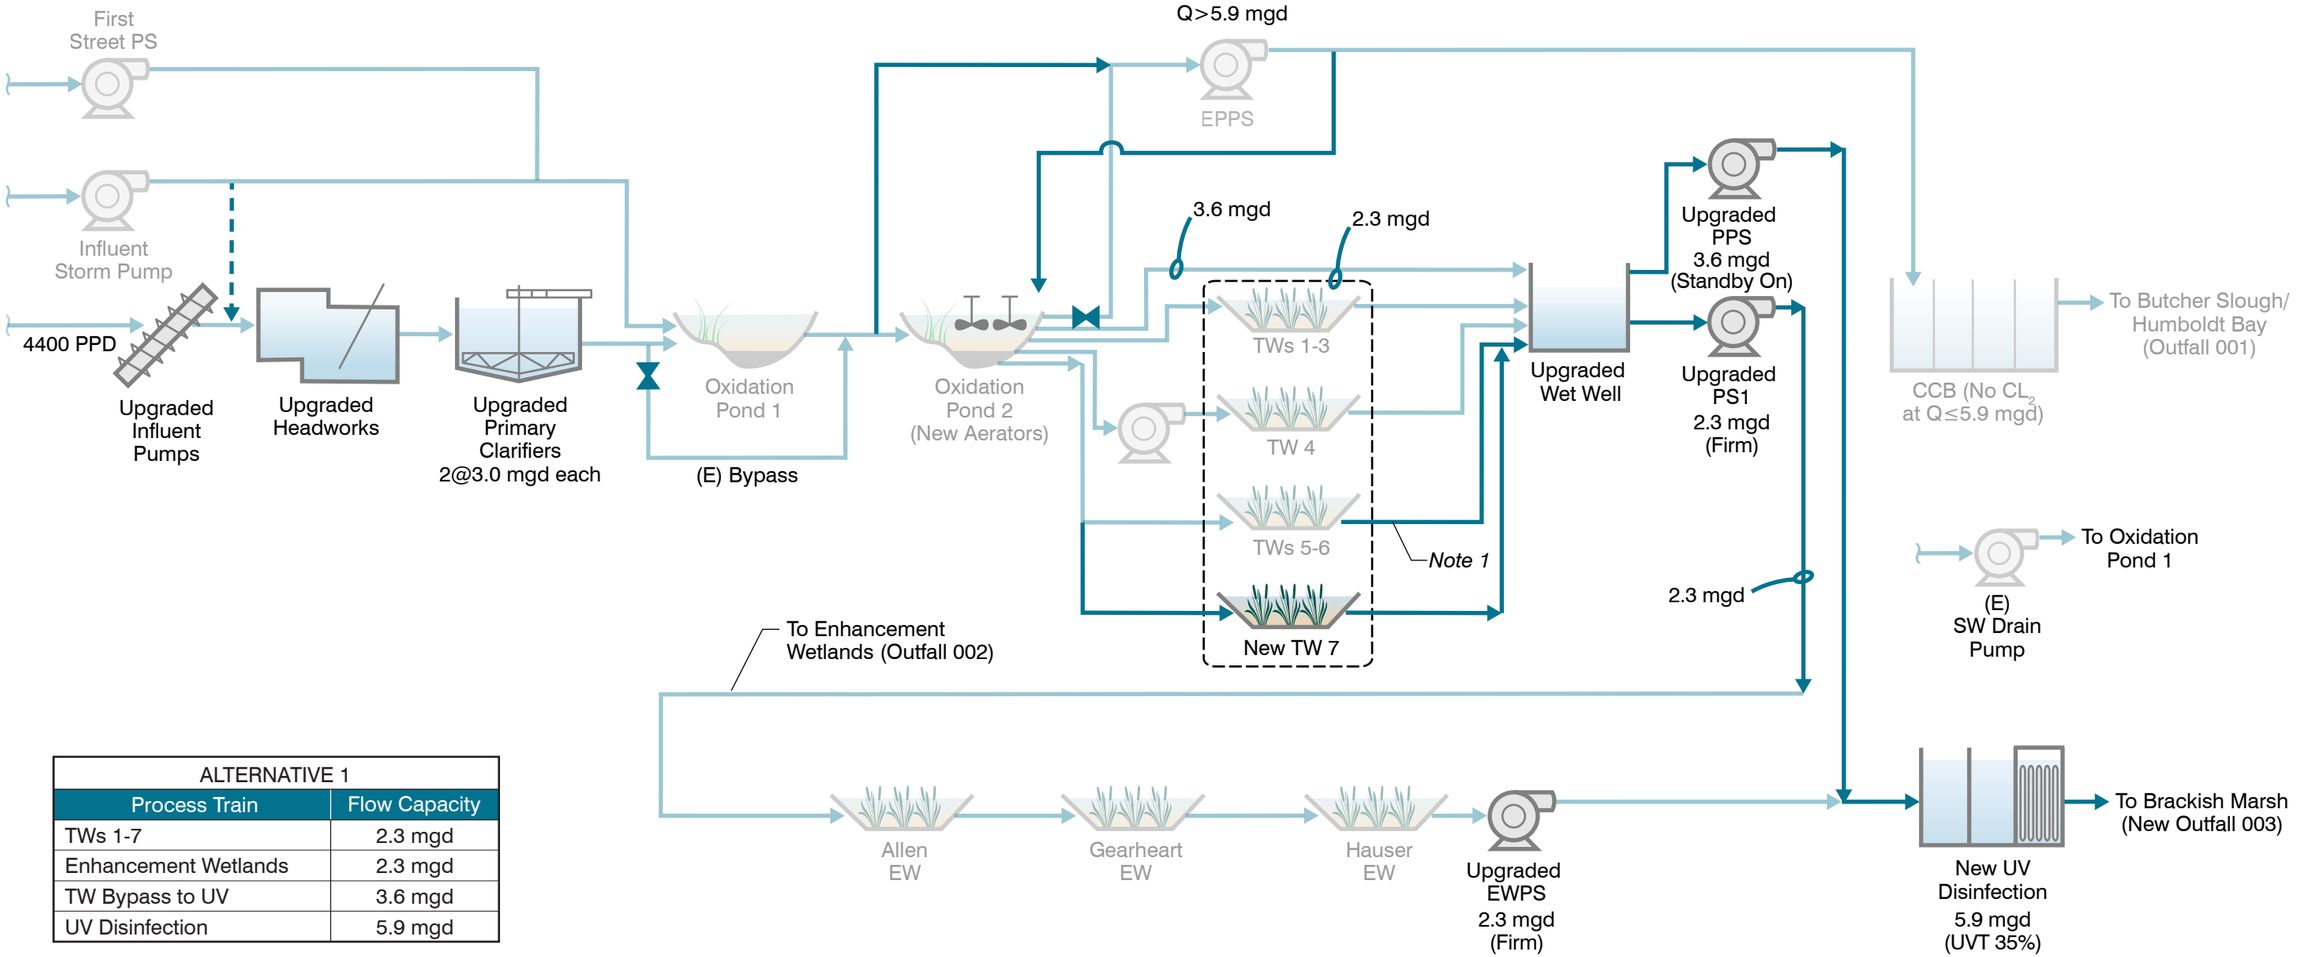
| Table 6.6 Secondary Treatment Options Evaluation of Economic Factors Wastewater Treatment Facility Improvements Project City of Arcata | | | | | | |
|---|---|---|---|---|---|---|
| | Criteria Scale: 1 (least favorable) to 3 (most favorable) | | | | | |
| Option | Construction Cost | Footprint | Operator Attention | Power Cost | Sludge Production | Maintenance Requirement |
| Conventional Activated Sludge | 3 | 3 | 1 | 1 | 1 | 1 |
| Extended Aeration – Oxidation Ditch | 2 | 1 | 2 | 2 | 2 | 3 |
| Trickling Filters | 1 | 2 | 3 | 3 | 3 | 2 |

## 6.5 PROJECT ALTERNATIVE DEVELOPMENT AND COMPARISON

The most viable options identified in the screening process were further refined as project alternatives that address how the facility would perform as a system, since system performance affects the viability of any one process. Project alternatives consider facility-specific issues such as flow routing, hydraulic and treatment capacity of individual processes, and process improvement or replacement needs based on condition assessment. The goal of each project alternative is to provide a facility that maximizes use of the existing natural system while meeting treatment and permit compliance objectives.

Based on the findings of the preliminary and secondary screening as well as feedback received at presentations made to City Staff, the public and City Council in April 2016, three project alternatives were originally developed:

- Alternative 1, Existing System Rehabilitation. This alternative improves the existing natural treatment system with no supplemental secondary treatment process. This alternative does not provide the required capacity to meet the BOD capacity shortfall. In the past the shortfall was made up by use of chlorine for supplemental BOD removal. This alternative will not provide year-round nitrification removal. This alternative was conceptualized by AMRI and further evaluated by Carollo to meet treatment and permit compliance objectives. Aeration would be added to the ponds and Treatment Wetland No. 7 would be constructed to provide some supplemental capacity, but a 1000 ppd BOD removal deficiency at 20 percent growth projection is still anticipated. The Alternative 1 flow schematic is shown in Figure 6.1.
- Alternative 2, Existing System with Side-stream Treatment. This alternative provides a side-stream secondary treatment process parallel to the ponds and treatment wetlands that returns flow upstream of the enhancement wetlands. The ponds and treatment wetlands would continue treating the majority of the plant influent flow. The side-stream treatment process would treat a portion of the plant influent flow as needed for supplemental BOD and year-round partial nitrification treatment capacity. Both effluents would normally blend before passing through the enhancement



| ALTERNATIVE 1 | |
|---|---|
| Process Train | Flow Capacity |
| TWs 1-7 | 2.3 mgd |
| Enhancement Wetlands | 2.3 mgd |
| TW Bypass to UV | 3.6 mgd |
| UV Disinfection | 5.9 mgd |

*Notes:*
*1. Eliminate Pump Station 2 and upgrade PPS/PS1 Wet Well to allow flow by gravity from TWs 5-6.*

LEGEND
- New Piping

FIGURE 6.1

CITY OF ARCATA
*WASTEWATER TREATMENT FACILITY IMPROVEMENTS PROJECT*

arc0516rf9-9913.ai

wetlands and UV disinfection. The Alternative 2 flow schematic is shown in Figure 6.2.

- Alternative 3, Existing System with Parallel Treatment. This alternative provides a parallel secondary treatment process to the ponds, treatment wetlands, and enhancement wetlands. The natural system train and parallel process train would each treat a portion of the plant influent flow at variable percentages to provide a blended effluent meeting treatment objectives. The natural system would continue treating the majority of the plant influent flow up to available hydraulic and treatment capacity. The parallel process train, currently planned as oxidation ditches followed by secondary clarifiers, would provide BOD and year-round full nitrification treatment capacity to handle the remainder of the hydraulic capacity needs and to meet specific blended water quality requirements. Natural system effluent and parallel process effluent would combine prior to UV disinfection. The Alternative 3 flow schematic is shown in Figure 6.3.

## 6.5.1 Alternative Descriptions

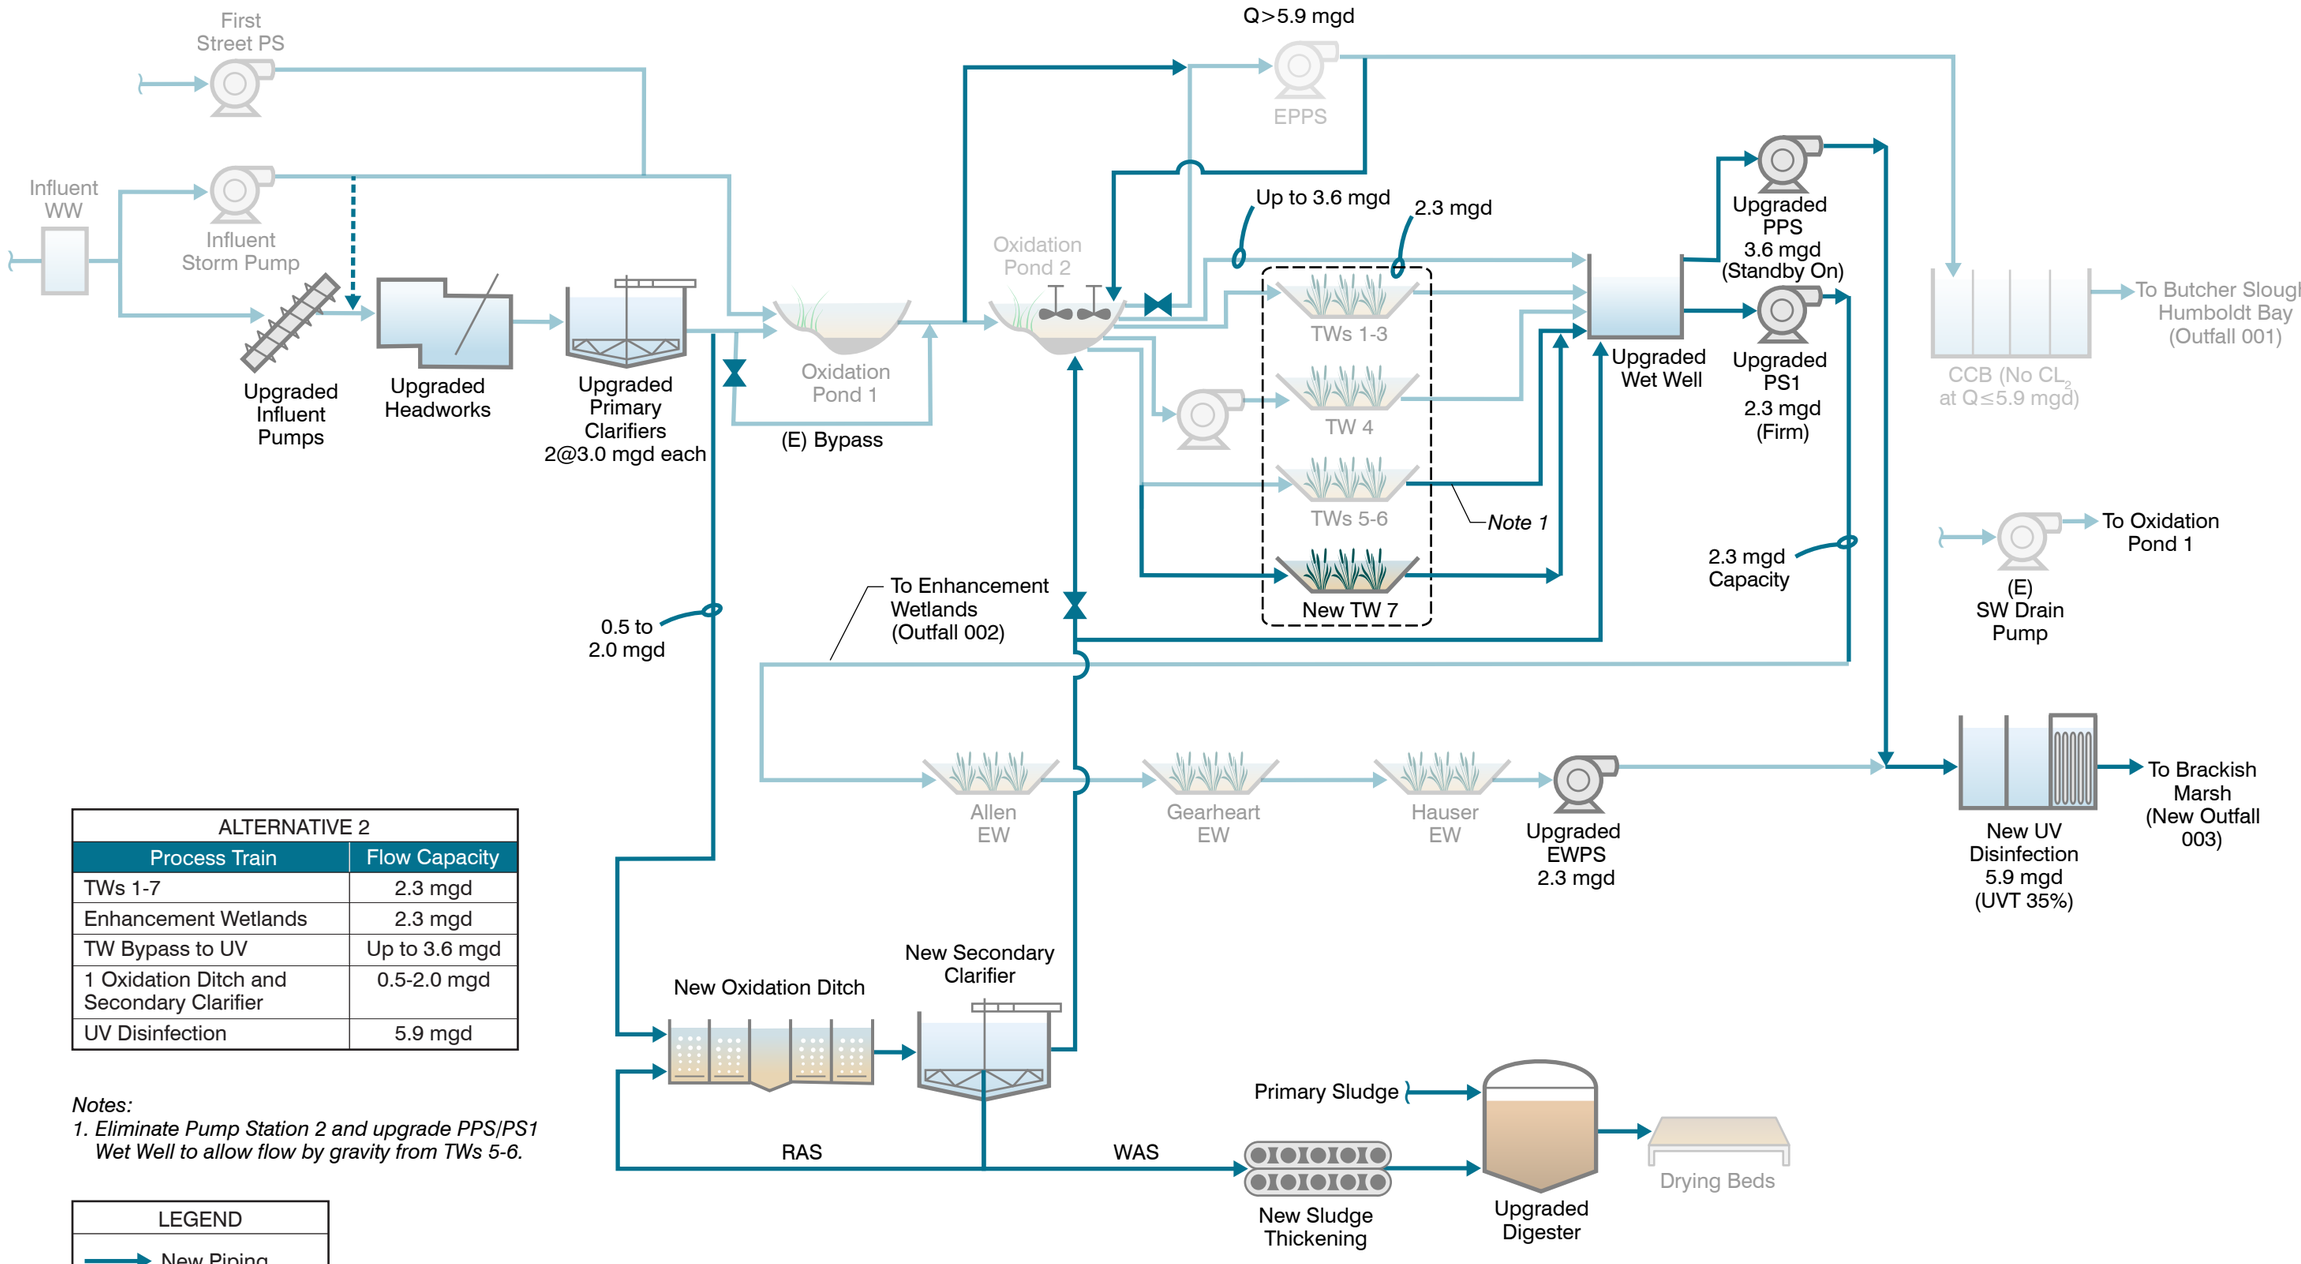
Descriptions for each project alternative are described in detail below, and a comparison of their design criteria is summarized in Appendix K.

### 6.5.1.1 Alternative 1 - Existing System Rehabilitation

In Alternative 1, the oxidation ponds would normally handle up to 5.9 mgd, with wet weather flows greater than 5.9 mgd stored in Oxidation Pond 1, or in an emergency, sent to the existing chlorine contact basin for disinfection and discharge through existing Outfall 001. Flow to the treatment wetlands would be limited to 2.3 mgd with new Treatment Wetland No. 7 online; flows in excess of 2.3 mgd would bypass the treatment wetlands and be blended with treatment wetlands effluent prior to being sent to the enhancement wetlands. Any excess blended flows would be routed directly to the influent side of the new UV disinfection and blended with the enhanced wetlands effluent. Disinfected effluent would be discharged through new Outfall 003.

Alternative 1 includes the following elements:

- Headworks improvements rated at 5.9 mgd.
- Replace existing primary clarifiers with two new primary clarifiers rated at 3.0 mgd each. This sizing would allow process redundancy at the design average flow condition of 2.3 mgd, with overall capacity for the design PWWF condition of 5.9 mgd. Replace existing primary sludge and scum pumps with new pumps sized for two new 3.0 mgd primary clarifiers.
- Emergency Pond Pump Station improvements, oxidation ponds improvements, Treatment Wetland Nos 1 through 4 maintenance, evaluation of Treatment Wetland No. 4 influent pumps and Pump Station 2, and enhancement wetlands improvements are recommended as previously described in Section 1.3.



| ALTERNATIVE 2 | |
|---|---|
| Process Train | Flow Capacity |
| TWs 1-7 | 2.3 mgd |
| Enhancement Wetlands | 2.3 mgd |
| TW Bypass to UV | Up to 3.6 mgd |
| 1 Oxidation Ditch and Secondary Clarifier | 0.5-2.0 mgd |
| UV Disinfection | 5.9 mgd |

*Notes:*
1. *Eliminate Pump Station 2 and upgrade PPS/PS1 Wet Well to allow flow by gravity from TWs 5-6.*

FIGURE 6.3

CITY OF ARCATA
*WASTEWATER TREATMENT FACILITY IMPROVEMENTS PROJECT*

arc0516rf11-9913.ai

- New Oxidation Pond No. 2 aerators are recommended to improve aeration and mixing while preventing short circuiting. The eight existing propeller-type mechanical aerators in Pond No. 1 are in poor condition and several have not been used for a number of years. New mechanical aerators (horizontal type) are recommended to be installed in Pond No. 2 to improve pond mixing, reduce short circuiting, and provide additional BOD treatment capacity of Pond No. 2 by 600 ppd.
- Construction of new Treatment Wetland No. 7 is recommended. This project would convert an existing aquaculture pond into a new 2.3-acre treatment wetland, increasing the hydraulic capacity of the treatment wetlands from 1.8 mgd to 2.3 mgd. As discussed in Chapter 4, constructing Treatment Wetland No. 7 is anticipated to increase the BOD treatment capacity of the treatment wetlands from 340 ppd to 420 ppd.
- The recommended Treatment Wetlands Pump Station 1 improvement is to replace the existing 2.3-mgd firm capacity pumps with new 2.3-mgd firm capacity pumps due to age and condition. This sizing matches the anticipated capacity of the treatment wetlands after construction of Treatment Wetland No. 7. The recommended Pond Pump Station improvement is to replace the existing 2.9-mgd firm capacity pumps with new pumps due to age and condition so that the pump station will have 3.6 mgd capacity with the standby pump running. Improvement of the combined wet well is also recommended so that Treatment Wetland Nos. 5 and 6 can flow by gravity into the pump station, eliminating Pump Station 2.
- The recommended Enhancement Wetlands (Hauser) Pump Station improvement is to replace the existing 1.2-mgd firm capacity pumps with new 2.3-mgd firm capacity pumps to match the new flow routing capacity through the enhancement wetlands. Additional pump station improvements include adding a mechanical bar screen on the pump station inlet and strainers on the discharge line.
- Upgrade and reconfiguration of the sludge digestion system is recommended to accommodate additional primary sludge associated with increasing primary clarifier capacity. Project elements will be refined during preliminary design but may include digester cover rehabilitation and digester tank modifications.
- New UV disinfection system sized for 35 percent UVT as described in Chapter 7.

#### 6.5.1.2 Alternative 2 - Existing System with Side-stream Treatment

In Alternative 2, plant influent flow up to 5.9 mgd would be routed to the primary clarifiers before splitting to either the natural system train (oxidation ponds and treatment wetlands) or the side-stream secondary treatment train. Normally flows up to 2.3 mgd would be treated by the oxidation ponds and Treatment Wetland Nos. 1 through 7, while minimum flow (i.e. 0.5 mgd) would be treated by the side-stream secondary treatment train. Effluent from the side-stream treatment could be brought back into the treatment wetlands to take advantage of denitrification that would occur, or could be blended with treatment wetlands

effluent, depending on operational needs. During pond turnover or other seasonal periods when the natural system capacity is limited, the side-stream secondary treatment train could be ramped up to handle up to 2.0 mgd. The two secondary effluents would be combined and 2.3 mgd sent to the enhancement wetlands. Any flows greater than 2.3 mgd would be blended with enhancement wetlands effluent and then disinfected with the new UV system. Disinfected effluent up to 5.9 mgd would be discharged through new Outfall 003. Wet weather flows above 5.9 mgd would be stored in Oxidation Pond 1, or in an emergency sent to the existing chlorine contact basin for disinfection and discharge through existing Outfall 001.

The facility improvements for Alternative 2 are similar to Alternative 1, with the exception of the following:

- Construct a side-stream secondary treatment process to handle the BOD treatment capacity shortfall and provide partial nitrification. Currently the recommended process for Alternative 2 is one new oxidation ditch and one new secondary clarifier sized for 2.0 mgd capacity, with the ability to turn flow down to 0.5 mgd. If Alternative 2 proceeds into Preliminary Design, the hydraulic and treatment capacity requirements can be refined.
- New Oxidation Pond No. 2 aerators are also recommended in Alternative 2 to improve aeration and mixing while preventing short circuiting, while reducing the treatment capacity required by the side-stream secondary treatment process.
- Upgrade and reconfiguration of the sludge digestion system is recommended to accommodate additional sludge associated with the new secondary treatment project. Project elements will be refined during preliminary design but may include digester cover rehabilitation, digester tank modifications, and heater/boiler upgrade.
- New secondary sludge thickening equipment will be required to accommodate additional sludge associated with the new secondary treatment project. Currently the project element includes one gravity belt thickener sized for sludge from one 2.0 mgd oxidation ditch and secondary clarifier.

#### 6.5.1.3 Alternative 3 - Existing System with Parallel Treatment

In Alternative 3, the natural system (oxidation ponds, treatment wetlands, and enhancement wetlands) would normally handle up to 1.8 mgd year-round. The basis of this capacity is maintaining reliable year-round treatment and permit compliance based on existing design criteria and operational experience. Plant influent flow above 1.8 mgd and less than 5.9 mgd would be routed to the new parallel secondary treatment train. The two secondary effluents would be blended prior to disinfection with the new UV system and discharge through new Outfall 003. Blending proportions could be adjusted to achieve desired effluent water quality. Wet weather flows above 5.9 mgd would be stored in Oxidation Pond 1, or in an emergency sent to the existing chlorine contact basin for disinfection and discharge through existing Outfall 001.

The facility improvements for Alternative 3 are similar to Alternatives 1 and 2, with the exception of the following:

- Replace existing primary clarifiers with one new primary clarifier rated at 1.8 mgd. This sizing would match the hydraulic capacity of the treatment wetlands and enhancement wetlands without providing standby capacity, though space could be provided for future addition of a second clarifier. The primary clarifier capacity in Alternative 3 is smaller than in Alternatives 1 and 2 because oxidation ditches do not require upstream treatment with primary clarifiers. This Alternative would also replace existing primary sludge and scum pumps with new pumps sized for the new 1.8 mgd primary clarifier.
- Oxidation Pond No. 2 aerators are not required with Alternative 3.
- Construction of new Treatment Wetland No. 7 is not required as part of the 10-year CIP for Alternative 3, but is a recommended future project for overall reliability.
- For Alternative 3, the recommended Pond Pump Station improvement is to replace the existing 2.9-mgd firm capacity pumps with new 1.8-mgd firm capacity pumps. Improvement of the wet well is also recommended so that Treatment Wetland Nos. 5-6 can flow by gravity into the pump station, eliminating Pump Station 2. In Alternative 3, Treatment Wetlands Pump Station 1 may be eliminated since flows above 1.8 mgd (Treatment Wetlands hydraulic and treatment capacity) would first be routed to the parallel secondary treatment train, with peak wet weather flows above 5.9 mgd routed via the Emergency Pond Pump Station.
- For Alternative 3, the recommended Enhancement Wetlands (Hauser) Pump Station improvement is to replace the existing 1.2-mgd firm capacity pumps with new 1.8-mgd firm capacity pumps to match the flow routing capacity through the enhancement wetlands. Additional pump station improvements include adding a mechanical bar screen on the pump station inlet and strainers on the discharge line.
- New UV disinfection system sized for 55 percent UVT as described in Chapter 7.
- Construct a parallel secondary treatment process to handle the design influent BOD load and provide full nitrification for up to 4.1 mgd. Currently the recommended process for Alternative 3 is two new oxidation ditches and two new secondary clarifiers, each sized for 2.0 mgd capacity with the ability to turn flow down to 0.5 mgd. If Alternative 3 proceeds into Preliminary Design, the hydraulic and treatment capacity requirements can be refined.
- Upgrade and reconfiguration of the sludge digestion system is recommended to accommodate additional sludge associated with the new larger secondary treatment project. Project elements will be refined during preliminary design but may include digester cover rehabilitation, digester tank modifications, and heater/boiler upgrade.

- New secondary sludge thickening equipment will be required to accommodate additional sludge associated with the new secondary treatment project. Currently the project element includes one gravity belt thickener sized for sludge from two 2.0 mgd oxidation ditches and two secondary clarifiers.

### 6.5.2 Comparison of Alternatives

The three alternatives each have advantages and disadvantages from economic and non-economic factors. The economic factors (project cost and operations/maintenance cost) and project implementation considerations will be further discussed in Chapter 8, Capital Improvements Program. Non-economic advantages and disadvantages of the three alternatives are:

- Alternative 1 - Existing System Rehabilitation: BOD treatment capacity is limited in the existing natural system. Project elements to increase BOD treatment capacity include sludge removal in Ponds 1 and 2, adding aerators to Pond 2, and construction of Treatment Wetland No. 7; however, even with these improvements there will be a BOD treatment capacity shortfall with the elimination of chlorine. This would result in permit violations and mandatory minimum penalties. Increasing the growth projection from 10 to 20 percent increases the BOD treatment capacity shortfall, which will be difficult to address in Alternative 1 without an additional secondary treatment process. Furthermore, future ammonia and total nitrogen permit limits may not be met year-round with Alternative 1 without an additional nitrification process. As previously discussed, effluent discharge bypassing enhancement is a violation of permit requirements. Alternative 1 currently requires up to 3.6 mgd to bypass the Enhancement Wetlands due to capacity limitations, which does not meet permit objectives.
- Alternative 2 - Existing System with Side-stream Treatment: Like Alternative 1, project elements to increase natural system BOD treatment capacity in Alternative 2 include sludge removal in Ponds 1 and 2, adding aerators to Pond 2, and construction of Treatment Wetland No. 7; however, a BOD treatment capacity shortfall would be supplemented by the side-stream secondary treatment process of one oxidation ditch and one secondary clarifier. Increasing the growth projection from 10 to 20 percent increases the BOD treatment capacity shortfall, which could be addressed in Alternative 2 by increasing capacity in the oxidation ditch. Alternative 2 is anticipated to meet current permit requirements for enhancement through advanced secondary treatment with nitrification, providing full BOD treatment capacity without disinfection byproduct violations, as well as meeting future ammonia and total nitrogen permit limits year-round. However, this alternative is anticipated to be the highest capital cost as it requires the most project elements.
- Alternative 3 - Existing System with Parallel Treatment: In Alternative 3, sludge removal in Ponds 1 and 2 is recommended to increase natural system hydraulic capacity and BOD treatment capacity. The natural system will still provide a baseload

secondary treatment, but the addition of the parallel secondary treatment process of two oxidation ditches and two secondary clarifiers means that Pond 2 aerators would not be needed. Treatment Wetland No. 7 is still recommended for construction in the 10-year CIP to improve reliability. Increasing the growth projection from 10 to 20 percent increases the BOD treatment capacity shortfall, which could be addressed in Alternative 3 by increasing capacity in one or both oxidation ditches. Alternative 3 is anticipated to meet current permit requirements for enhancement through advanced secondary treatment with nitrification, providing full BOD treatment capacity without disinfection byproduct violations, as well as meeting future ammonia and total nitrogen permit limits year-round. This alternative is anticipated to be lower in capital cost than Alternative 2 as some project elements can be eliminated or decreased. This alternative is anticipated to require the largest footprint in the treatment plant.

- The advantages and disadvantages of the alternatives are summarized in Table 6.7.

**Table 6.7 Summary of Alternative Comparison for Non-Economic Factors Wastewater Treatment Facility Improvements Project City of Arcata**

| Alternative | Criteria Scale: 1 (least favorable) to 3 (most favorable) | | | | |
|---|---|---|---|---|---|
| | Meets Permit (Enhancement and No Bypass) | Ease of O&M | Construct -ability | Reliability | Meets Future Ammonia Removal |
| 1. Existing System Rehabilitation | 1 | 3 | 1 | 1 | 1 |
| 2. Existing System with Side-stream Treatment | 2 | 1 | 2 | 2 | 2 |
| 3. Existing System with Parallel Treatment | 3 | 2 | 3 | 3 | 3 |

## 6.6 EXPANDED ALTERNATIVE

After the facility plan was finalized in June 2016, the City met with the North Coast Regional Water Quality Control Board (RWQCB) to discuss the Facility Plan and NPDES permit requirements on June 27, 2016. In response to feedback received at that meeting from the RWQCB, additional work was identified in order to complete the facility planning phase and to guide the City in selection of a preferred project alternative. Specifically, the feedback received from the RWQCB included the following:

- Enhancement of flows up to the 5.9 mgd peak wet weather capacity is a permit requirement in accordance with the Enclosed Bays and Estuaries Policy (State Water Board Resolution No. 74-43).
- The City will receive ammonia limits in the next NPDES permit in 2017. The RWQCB indicated that limits similar to those given to Eureka would be likely.

- Bypass of wet weather flows is an issue requiring further consideration.

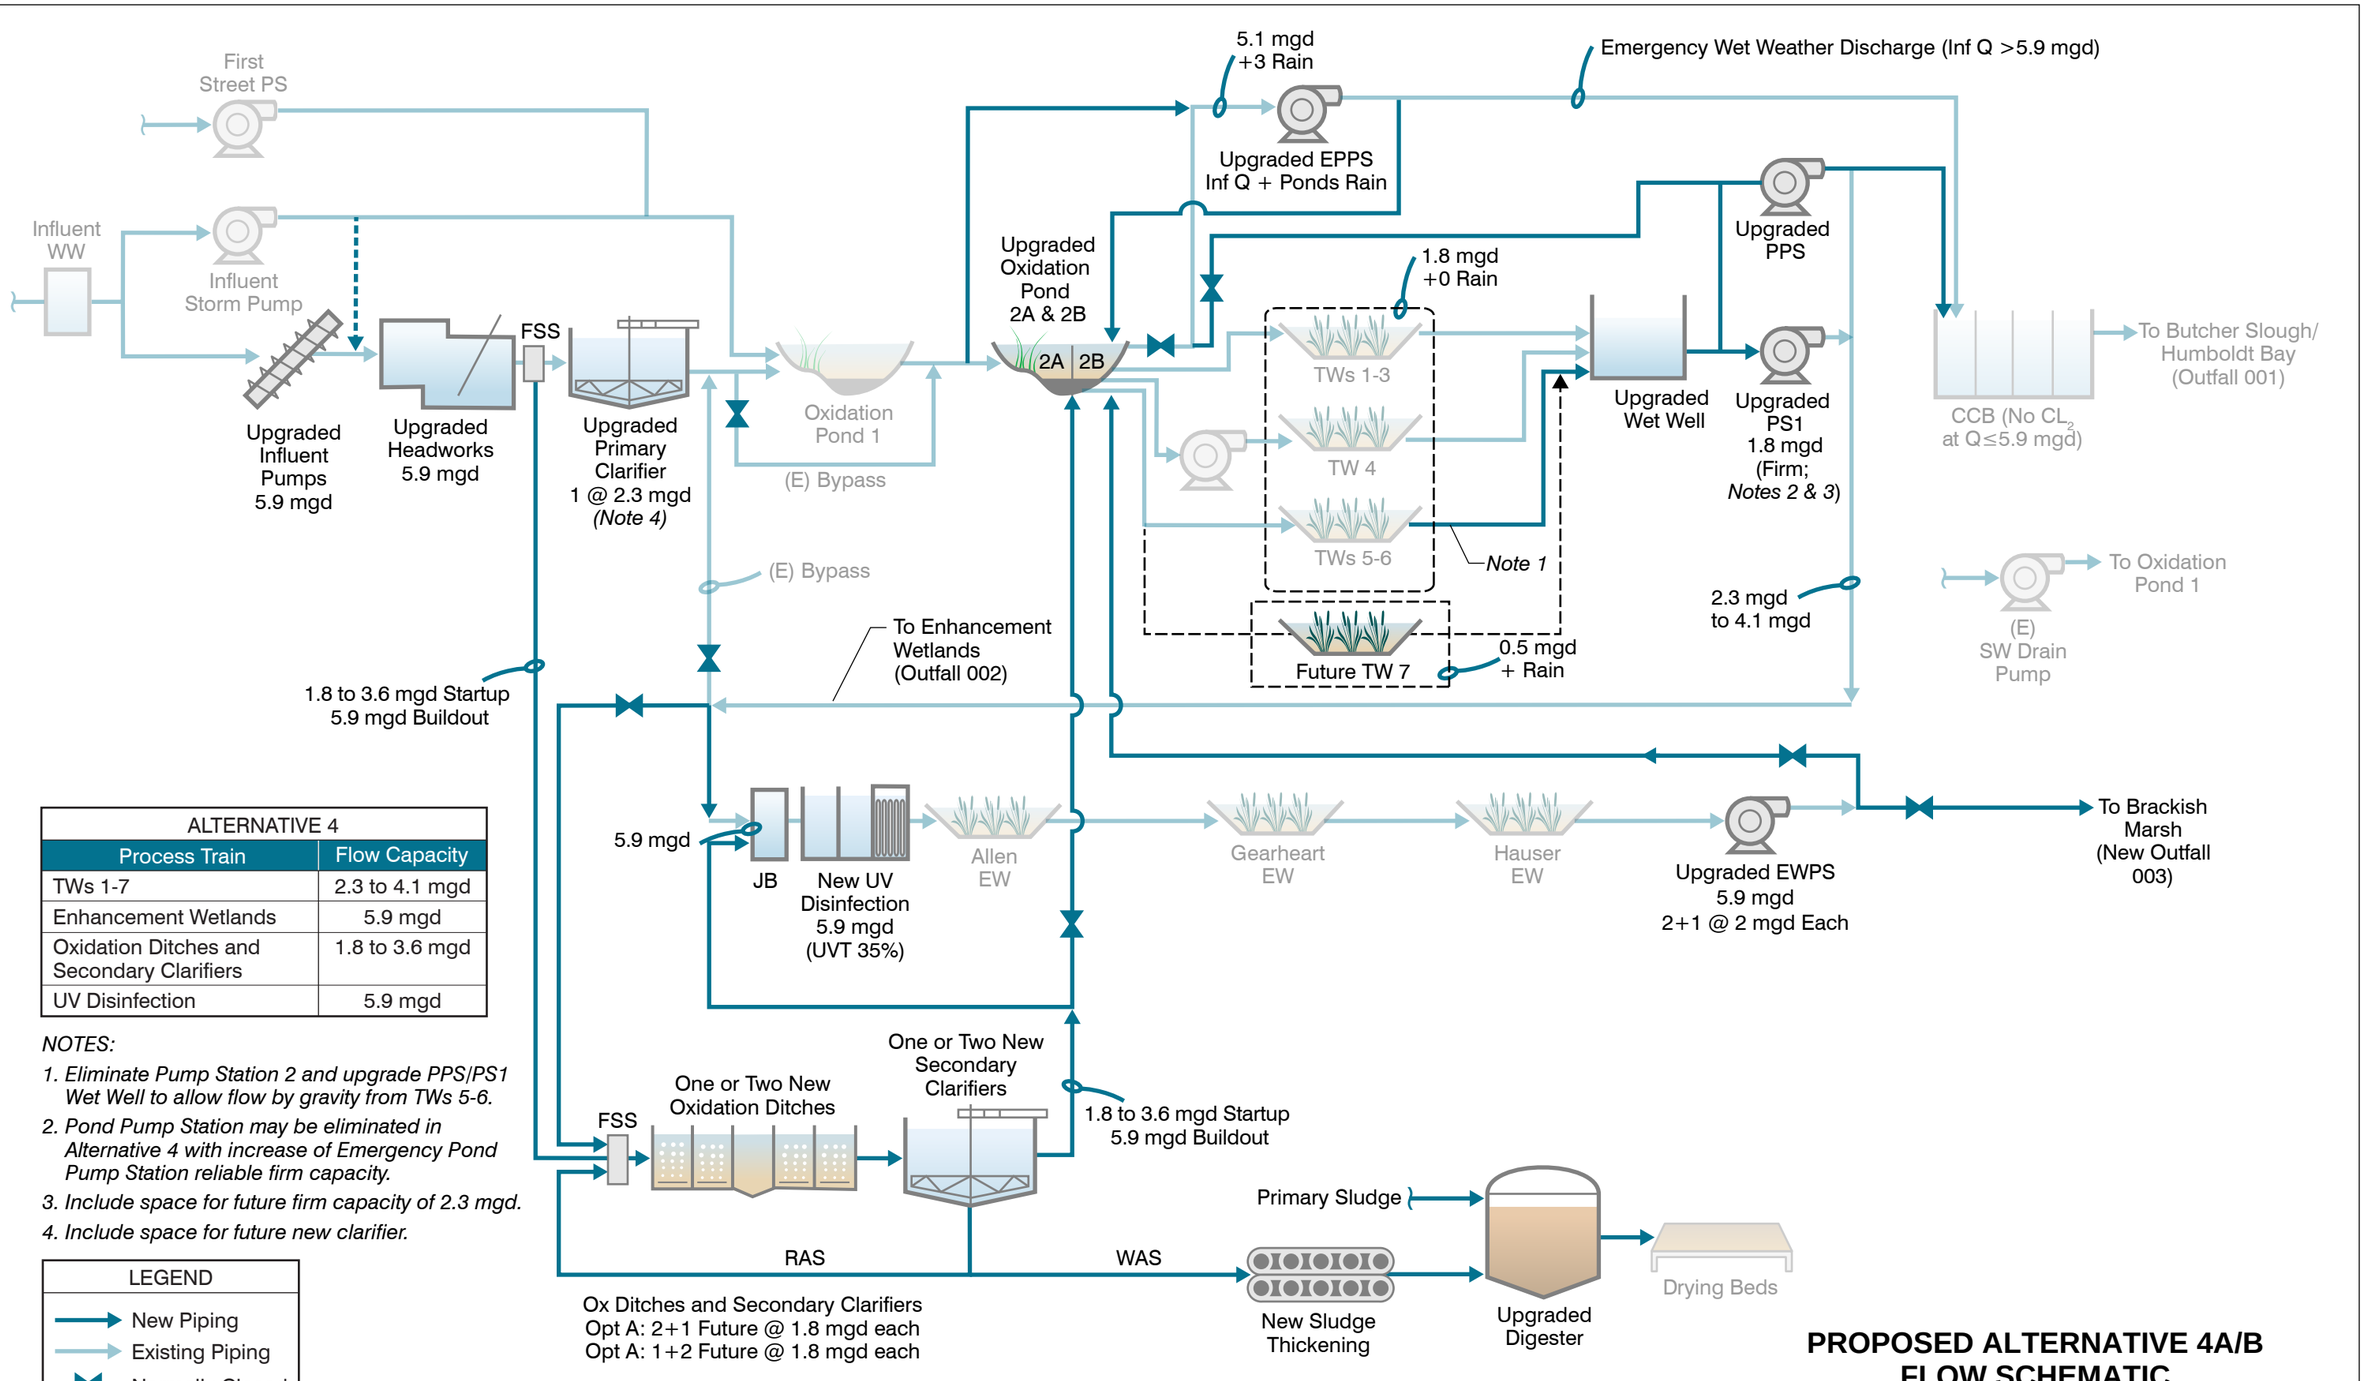
Accordingly, a new project Alternatives No. 4, was developed, to meet these additional objectives. Based on the feedback by the RWQCB, the original Alternatives 1-3 would not meet the requirements anticipated in the new NPDES permit.

### 6.6.1 Alternative 4 Upgraded Existing System with Parallel Treatment

This alternative provides both an upgrade to the existing pond / wetland treatment system and a parallel secondary treatment process. The natural system train and parallel process train would each treat a portion of the plant influent flow at variable percentages to provide a blended effluent meeting treatment objectives. The natural system would continue treating the majority of the plant influent flow up to available hydraulic and treatment capacity. The parallel process train, currently planned as oxidation ditches followed by secondary clarifiers, would provide BOD and year-round full nitrification treatment capacity to handle the remainder of the hydraulic capacity needs and to meet specific blended water quality requirements. Natural system effluent and parallel process effluent would combine prior to UV disinfection. The Alternative 4 flow schematic is shown in Figure 6.4.

The following assumptions for Alternative No. 4 were made:

- All flows up to 5.9 mgd will be routed through the Enhancement Wetlands. Hydraulic optimization of flow routing through the Enhancement Wetlands may be accomplished in parallel mode rather than the existing series mode, which will be further evaluated during preliminary design.
- The City will need to comply with year-round ammonia effluent discharge limits in the next NPDES permit in 2017. Assumed that limits will be similar to City of Eureka's that were adopted in June 2016: average monthly total ammonia nitrogen of 4.1 mg/L, and maximum daily total ammonia nitrogen of 10 mg/L.
- Emergency wet weather discharge for flows above 5.9 mgd needs to be addressed.
- Currently permitted facility design instantaneous peak wet weather flow of 16.5 mgd needs to be addressed.
- Rainfall accumulation and discharge for the natural system (oxidation ponds, treatment wetlands, and enhancement wetlands) needs addressed.
- Locating the new UV Disinfection System upstream of the Enhancement Wetlands is preferred, for the following reasons:
  - Moves point of compliance upstream of the Enhancement Wetlands; split compliance or a phased approach may need to be considered. Limited ability to perform maintenance in the Enhancement Wetlands as Waters of the State could diminish future water quality (and hence UV disinfection capability).
  - Facility hydraulic profile starting at the headworks could be lowered (construction and operations and maintenance [O&M] cost savings).



| ALTERNATIVE 4 | |
|---|---|
| **Process Train** | **Flow Capacity** |
| TWs 1-7 | 2.3 to 4.1 mgd |
| Enhancement Wetlands | 5.9 mgd |
| Oxidation Ditches and Secondary Clarifiers | 1.8 to 3.6 mgd |
| UV Disinfection | 5.9 mgd |

*NOTES:*

1. *Eliminate Pump Station 2 and upgrade PPS/PS1 Wet Well to allow flow by gravity from TWs 5-6.*
2. *Pond Pump Station may be eliminated in Alternative 4 with increase of Emergency Pond Pump Station reliable firm capacity.*
3. *Include space for future firm capacity of 2.3 mgd.*
4. *Include space for future new clarifier.*

LEGEND

- Existing Piping
- Normally Closed Valve

# PROPOSED ALTERNATIVE 4A/B FLOW SCHEMATIC

FIGURE 6.4

CITY OF ARCATA
*WASTEWATER TREATMENT FACILITY IMPROVEMENTS PROJECT*

arc0617rf1-9913.ai

  - Flow configuration requires shorter flow routing with one bridge crossing (not two), resulting in construction and O&M cost savings.

- Recently collected plant UVT data suggests that UVT of Treatment Wetlands effluent is anticipated to be lower than originally thought (35 percent in Alternative 4; 55 percent in Alternative 3).

### 6.6.2 Alternative 4 Development

Alternative 4 was developed to meet the requirements of the RWQCB, and the assumptions listed above. During follow-up review with the City and AMRI, this alternative was further developed to allow for phased implementation depending on the level of treatment provided by upgrades proposed for the exiting oxidation ponds.

#### 6.6.2.1 Oxidation Pond Upgrades

As part of the development of Alternative 4, the City conducted an independent review of the oxidation pond's ability to meet the future discharge requirements. The review was conducted by a pond treatment expert with the purpose to study potential upgrades of the existing ponds to address the expected requirements of the RWQCB. The Pond Improvements study is included in Appendix U. The main recommendations from the study are outlined below:

- Pond 1 can be used for wet weather equalization. Facilities should be installed to control the depth in Pond 1.
- Pond 2 should be divided into 2 cells of equal volume and designed as partial mix aerated ponds. A baffle wall between the two sections would reduce short circuiting. The concept proposed in the review was to divide the ponds diagonally using interlocking plastic sheet pile. The influent section (2A) would be in the southwest portion of pond 2 section, and the effluent section would be in the northeast section.
- Aerators would be added to Pond 2A and 2B. The concept proposed in the review was to install ten 15 HP aerators in each section of pond 2 for a total of 300 HP. The aerators would be operated to maintain dissolved oxygen in the ponds.
- Provide alkalinity addition for the pond process to meet the requirements of ammonia removal (nitrification). Pond pH should be maintained at 7 in Pond 2A/2B using the alkalinity addition.

The recommended aeration would provide the ability to meet permit limits during low flow months, but may be compromised during higher wet weather flows and colder months. The report noted that predicted ammonia removal, between 4 to 6 mg/l, could be achieved at 2.3 mgd at temperatures down to 6 degrees C. Therefore the recommended pond improvements have some risk in meeting a permit requirement of 4 mg/L.

The exact configuration of the pond improvements will be finalized during the design phase of the project, although enough detail was developed in order to develop budget costs for

the recommended improvements. In addition, the original pond improvements including removal of pond solids, and transfer structure modifications are still required.

#### 6.6.2.2 Alternative 4 Elements

In Alternative 4, the natural system (oxidation ponds, treatment wetlands, and enhancement wetlands) would normally handle dry weather flows of 1.8 mgd and up to 2.3 mgd during peak wet weather flows. The basis of this capacity is maintaining reliable year-round treatment and permit compliance based on existing design criteria and operational experience. Plant influent flow above 2.3 mgd and less than 5.9 mgd would be routed to the new parallel secondary treatment train. The two secondary effluents would be blended prior to disinfection with the new UV system and discharge through new Outfall 003. Blending proportions could be adjusted to achieve desired effluent water quality. Wet weather flows above 5.9 mgd would be stored in Oxidation Pond 1, or in an emergency sent to the existing chlorine contact basin for disinfection and discharge through existing Outfall 001.

The proposed elements and flow schematic for Alternative 4 are shown in the Figure 6.4. During the development of this alternative it was decided to phase the construction of alternative 4, into Phase 4A and 4B.

The main features of Alternative No. 4 are outlined below:

- Headworks replacement rated at 5.9 mgd.
- Replace existing primary clarifier with a new unit rated at 2.3 mgd. In addition, space will be reserved for a future unit.
- Upgraded oxidation pond 2 as outlined above, including the creation of 2 partial mixed aerated cells.
- Emergency pond pump station improvements including piping to pump out pond 1 prior to wet weather.
- Construction of Treatment Wetlands No.7.
- Upgrades to pond pump station and pump station 1 to provide capacity and replace aging pumps.
- Construct a parallel secondary treatment process, in two phases:
  - Phase 4A would include one oxidation and secondary clarifier sized for a raw sewage flow of 1.8 mgd.
  - Phase 4B would include a second oxidation and secondary clarifier sized for a raw sewage flow of 1.8 mgd.
  - The size of the Phase 4B treatment capacity could be adjusted based on the results of the pond improvements and the ability of the ponds to meet permit limits.

- New UV disinfection system sized for a flow of 5.9 mgd at 35 percent UVT, as described in Chapter 7.
- Upgrades to the digesters, similar to alternative 3.
- New secondary sludge thickening equipment as noted in alternative 3.
- New or upgraded enhancement wetland pump station sized for a flow of 5.9 mgd. Pump station would pump directly to the new brackish marsh (outfall 003).

#### 6.6.2.3 Alternative 4 Phasing

The development of Alternative 4 considered phasing of the alternative to reduce the initial capital costs and increased operating costs. Phase 4A would include all the improvements except only one oxidation ditch and secondary clarifier would be constructed. Provisions would be included to add a second oxidation ditch and secondary clarifier in Phase 4B. The phased approach would allow the City to complete the upgrades to the existing oxidation ponds, then quantify the treatment capacity of the upgraded oxidation ponds.

#### 6.6.2.4 Alternative 5

Alternative 5 was developed to provide the City with the costs for an alternative to Alternative 4 that did not include pond modifications. It is based on three oxidation ditches and secondary clarifiers. This alternative was not considered, and was developed only for comparison of capital and operating costs.

### 6.6.3 Comparison of Alternative 3 and 4

A comparison of expanded Alternative 4 with the original Alternative 3 (with two oxidation ditches and two secondary clarifiers) is outlined in Table 6.8.

The three main difference between Alternative 3 and 4 include:

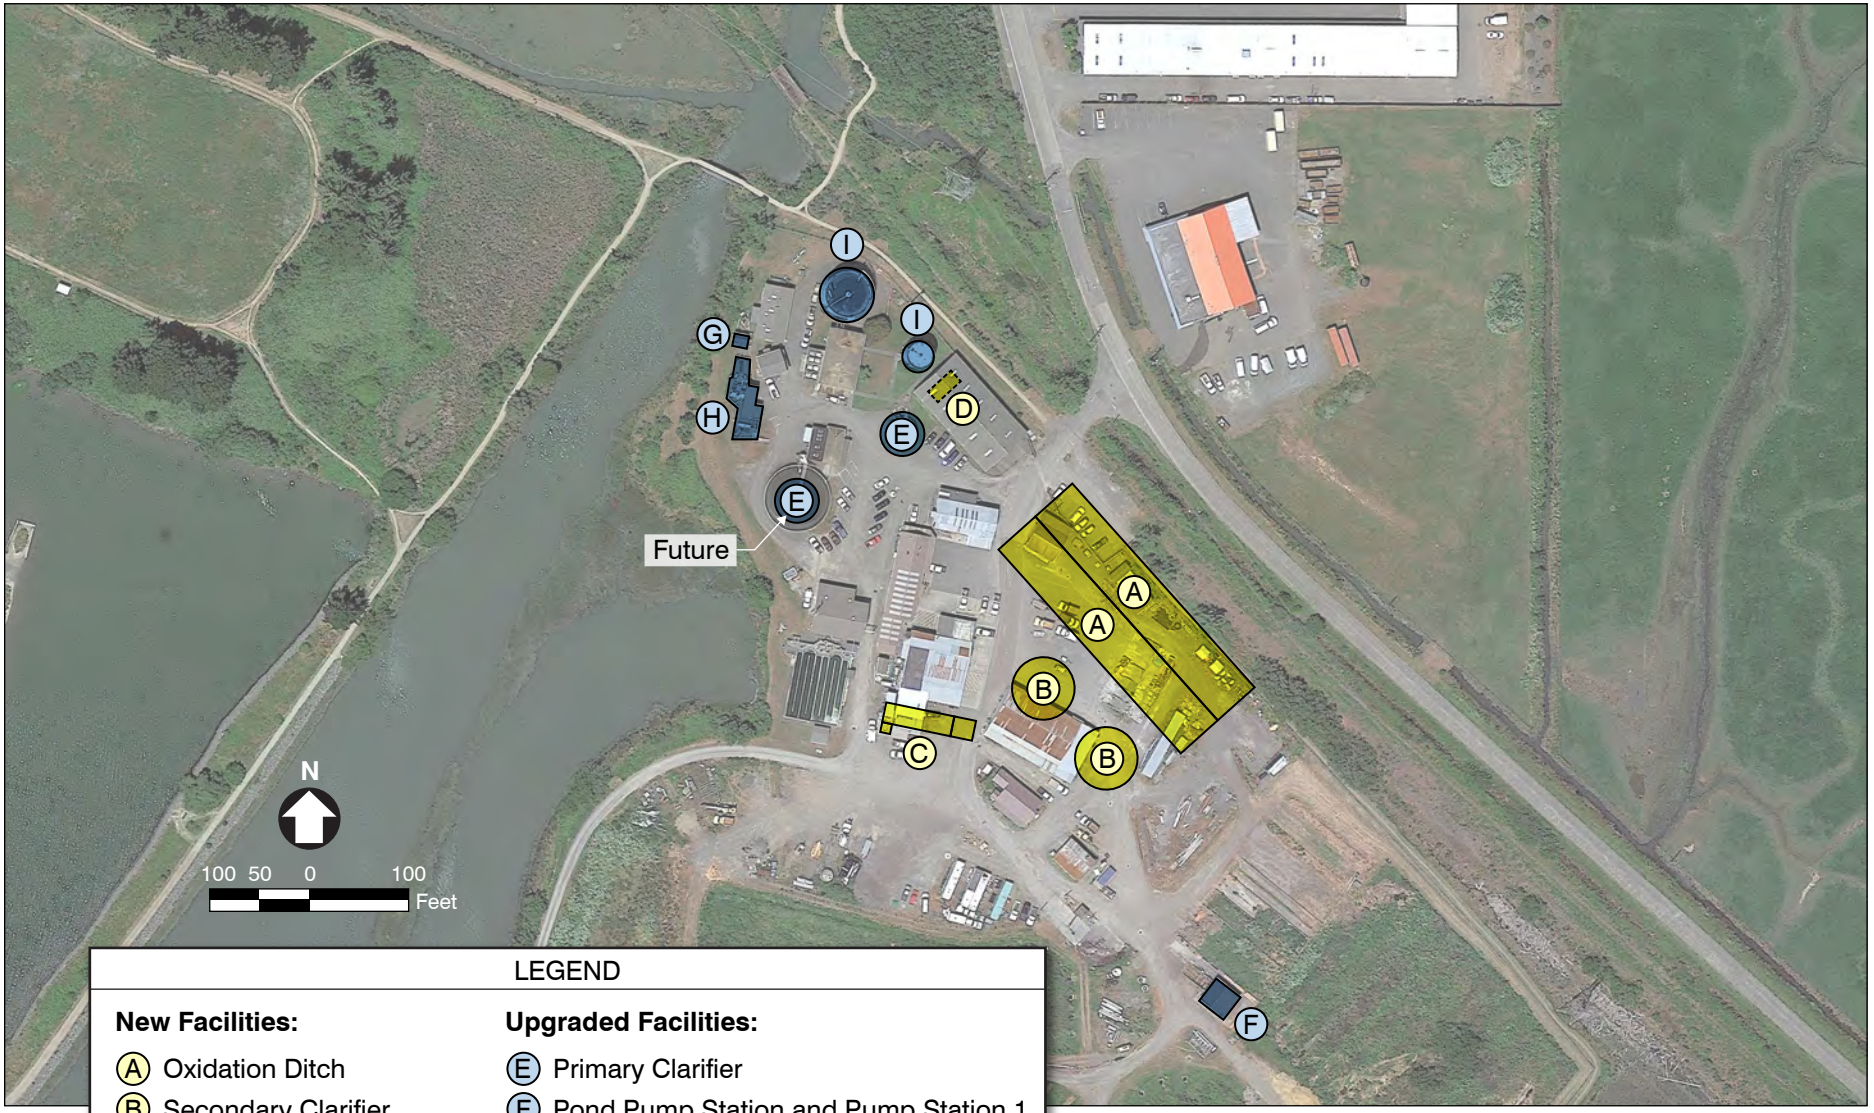
- Oxidation pond improvements in Alternative 4 are substantial in terms of costs, both capital and maintenance.
- UV system in Alternative 4 would be designed for lower UVT and higher dose, increasing costs.
- Enhancement wetlands pump station in Alternative 4 would be sized for flows up to 5.9 mgd.

Alternative 3 and 4 are anticipated to require the largest footprint in the treatment plant. A conceptual facilities site plan for these alternative is shown in Figure 6.5.

**Table 6.8 Comparison of Alternative 3 and 4 Elements**
**Wastewater Treatment Facility Improvements Project**
**City of Arcata**

| Process Area | Alternative 3 Design Criteria | Alternative 4 Design Criteria | Advantages | Disadvantages | Comment |
|---|---|---|---|---|---|
| Oxidation Pond Improvement | Not required | Aerators sized for BOD and ammonia removal (300 HP) | Increase the ability to meet ammonia removal requirements. | Higher power costs and higher maintenance costs | Improvements may still not meet permit requirements year round |
| Oxidation Ditches and Secondary Clarifiers | 0.5 to 4.1 mgd | 1.8 to 3.6 mgd | Ability to meet anticipated year-round ammonia removal requirements | Larger footprint; Higher construction cost | Element will be phased |
| UV Disinfection | 55% UVT; 35 $mJ/cm^2$ (1) | 35% UVT; 50 $mJ/cm^2$ (1) | Keeps UV at plant; ability to meet disinfection requirements at all blending ratios | Larger footprint (additional lamps); Higher construction and O&M cost | Higher dose anticipated with higher pond to oxidation ditch blending ratio |
| Primary Clarifiers | 1.8 mgd | 2.3 mgd | Provides capacity up to treatment capacity of Treatment Wetlands (after future No. 7 online) | Larger footprint; Higher construction cost | Maintain space for a second redundant unit in future |
| Enhancement Wetlands (Hauser) Pump Station | 1.8 mgd | 5.9 mgd + Rainfall | Meets requirements of Enclosed Bays and Estuaries Policy and provides wet weather discharge | Larger footprint (additional pumps); Higher construction and O&M cost | Design for future sea level rise |
| Pump Station 1 | 1.8 mgd | Up to 2.3 mgd + Rainfall | Provides discharge capacity up to treatment capacity of Treatment Wetlands and wet weather discharge | Larger footprint (additional pumps); Higher construction and O&M cost | Will no longer pump directly to Chlorine Contact Basin |
| Emergency Pond Pump Station | Not evaluated | Influent flow to Natural System + Rainfall | Allows for wet weather storage in Oxidation Pond No. 1 and emergency wet weather discharge | Larger footprint (additional pumps); Higher construction and O&M cost | Emergency wet weather discharge via Chlorine Contact Basin and Outfall 001 only for flows > 5.9 mgd |

Note:
(1) Additional analysis required to confirm that dose meets virus reduction concerns of RWQCB. Plant UVT data should continue to be collected and any seasonal variations, including differences in Enhancement Wetlands effluent and Treatment Wetlands effluent, should continue to be monitored.



LEGEND

**New Facilities:**

- (A) Oxidation Ditch

The costs of these alternatives are outlined in Chapter 8.

Chapter 7

# DISINFECTION SYSTEM EVALUATION

## 7.1 INTRODUCTION

This chapter provides an overview of the existing and proposed disinfection facilities at the Arcata Wastewater Treatment Facility (AWTF) and includes the following:

- Existing facilities description summarizing the general function and configuration of the chlorine and sulfur dioxide disinfection/dechlorination facilities at the AWTF.
- Proposed ultraviolet (UV) light disinfection facility evaluation and design criteria for the two treatment system alternatives.
- Summary and recommendations for the proposed UV disinfection system.

## 7.2 BACKGROUND

The City of Arcata operates the AWTF, which consists of headworks with screening and grit removal, primary clarification, oxidation ponds and treatment wetlands secondary treatment and polishing enhancement wetlands. Discharges from the AWTF are currently regulated by the National Pollutant Discharge Elimination System (NPDES) Order No. R1-2012-0031, which became effective on August 1, 2012, and will expire on July 31, 2017.

The beneficial uses of the receiving bay include habitat for shorebirds, waterfowl, raptors, and migratory birds, oyster farming, and recreational use. The complete list of beneficial uses is included in the NPDES Permit, Appendix A Table F-3 (Facility Plan Appendix A).

The existing secondary effluent is first disinfected and then discharged to the enhancement wetlands, then returned to the plant for a second disinfection step before discharge to Humboldt Bay (Outfall 001). The discharge permit outlines a disinfection and flow configuration upgrade that is based on a once-through flow system, with UV disinfection following the enhancement wetlands, and then discharge to a new discharge point at the brackish marsh (Outfall 003).

## 7.3 PURPOSE

The purpose of this evaluation is to provide a description of alternative UV effluent disinfection systems including sizing, equipment selection, conceptual layout, construction, and operation costs, and proposed implementation plan. The existing chlorine disinfection system is also described, and the impact on effluent treatment is outlined. The alternative disinfection projects are included in Chapter 6 and the capital improvements program described in Chapter 8 of this report.

## 7.4 DESIGN CRITERIA

The effluent disinfection system design criteria based on the current NPDES permit are listed In Table 7.1. The effluent limitations for fecal coliform bacteria at new Outfall 003 to Humboldt Bay were retained from the previous permit. These limitations, which are described below, reflect water quality objectives for bacteria established by the Basin Plan for protection of shellfish harvesting areas. The Basin Plan criteria are based on recommendations of the National Shellfish Sanitation Program for shellfish growing areas that are affected by point source discharges.

The NPDES permit requires that treated wastewater discharged to Humboldt Bay meet the following fecal coliform bacteria criteria:

- The median fecal coliform concentration shall not exceed a Most Probable Number (MPN) of 14 organisms per 100 mL in a calendar month.
- Not more than 10 percent of samples collected in a 30-day period shall exceed an MPN of 43 organisms per 100 mL.

**Table 7.1 UV Effluent Disinfection System Design Criteria**
**Wastewater Treatment Plant Improvements Project**
**City of Arcata**

| Indicator Organism | Unit | Value |
|---|---|---|
| Fecal coliform | MPN/100 ml | 14(1), 43(2) |
| **Flow** | | |
| Annual average dry weather | mgd | 2.3 |
| Average wet weather(3) | mgd | 5.0 |
| Maximum month(3) | mgd | 5.9 |
| Peak hour wet weather(4) | mgd | 16.5 |

Notes:
(1) Monthly Median.
(2) Not more than 10% of samples collected in a 30-day period shall exceed 43 MPN/100mL.
(3) UV effluent disinfection system capacity limit.
(4) Overall facility capacity limit including storage, UV disinfection, and wet weather discharge system.

## 7.5 EXISTING DISINFECTION SYSTEM

Treatment equivalent to secondary treatment is accomplished using two oxidation ponds followed by six treatment wetlands. Detention time in the AWTF, prior to Allen, Gearheart and Hauser enhancement wetland, is approximately 40 days during average dry weather design flow periods when the system is well-maintained. Currently, effluent is disinfected with chlorine and dechlorinated with sulfur dioxide prior to discharge. Under the existing AWTF configuration, treated effluent from the AWTF can be combined with effluent from the AMWS, disinfected, and split, flowing by gravity either to Humboldt Bay or again through

the AMWS. The result is disinfected secondary effluent, but not all effluent receives the benefit of enhanced wetland treatment through the AMWS before discharge to Humboldt Bay. In this mode of disinfection, effluent may actually be chlorinated multiple times, increasing the opportunity to form disinfection byproducts at levels above water quality objectives.

The existing disinfection system, including chlorine ($Cl_2$) gas disinfection followed by sulfur dioxide ($SO_2$) gas dechlorination, was constructed in 1984. Two banks of three one-ton $Cl_2$ gas cylinders are connected in parallel to provide a duty and standby supply of $Cl_2$ gas for disinfection. The chlorine gas feeders receive both a flow and residual signal for gas pacing and control. Gas induction units installed at the chlorine contact basin provide vacuum to transfer gas to the wastewater flow while providing mixing.

The 2003 plant evaluation (SHN 2003) noted that the system was near its maximum capacity to handle peak wet weather flows. At that time, measures were recommended to reduce chlorine use. It was noted that any capacity increases or upgrades of the existing gas systems would trigger the need to comply with current National Fire Protection Association (NFPA) standards.

### 7.5.1 Chlorine Contact Basin

The existing disinfection system includes a chlorine contact basin (CCB) constructed in 1984. The basin can operate as one or two tanks, labelled the east and west basins in the plant O&M manual. The approximate volume for each basin is 185,400 gallons. The detention time at 2.3 million gallons per day (mgd) is listed as 58 minutes, while the detention time at 5.9 mgd is listed as 30 minutes.

The plant operates the basin in two modes: Split or Combined Mode, which is shown schematically in Figure 7.1.

In the combined mode, flow from the treatment wetlands enter the east side, and is dosed with chlorine at the entrance to this first section. The flow then joins with the flow returned from the enhancement wetlands, mixed, and dosed a second time with chlorine. The combined flow is dechlorinated, then is split to return a portion of the flow to the enhancement wetlands, with the rest of the flow going to discharge through Outfall 001.

In split mode, flow from the treatment wetlands enters the east side, is not dosed with chlorine, and then goes to the enhancement wetlands. The return flow from the enhancement wetlands is dosed with chlorine for a first time as it enters the west basin section, then goes through the basin, is dechlorinated, and discharged to Outfall 001.

The combined mode is the normal operating mode, especially when flows exceed the capacity of the enhancement wetlands effluent pump station. This mode is especially important during wet weather flows. The split mode is used during low flows, or dry

weather. It has the advantage of reducing the chlorine usage to the amount needed to disinfect the flow at Outfall 001 and reducing the potential formation of disinfection by-products.

### 7.5.2 Chlorine and Sulfur Dioxide Use and Impact

The AWTF currently uses approximately 225 pounds per day (ppd) of chlorine and 160 ppd of sulfur dioxide for disinfection and dechlorination, based on 2014 data. The daily average chemical use by month for the last 5 years is included in Appendix L. Chlorination also appears to impact water quality by reducing effluent BOD and suspended solids. Information from the City and AMRI indicate that at times the BOD reduction can range from 700 to 1400 ppd.

## 7.6 PROPOSED ULTRAVIOLET LIGHT DISINFECTION

Ultraviolet (UV) light disinfection has been proposed for the AWTF discharge based on a series of pilot tests conducted by the City and the Arcata Marsh Research Institute (AMRI). The current Waste Discharge and NPDES permit provides general requirements for replacing the existing chlorination disinfection system with a UV system. The proposed UV system design requirements for the three project alternatives are outlined in this Section.

### 7.6.1 UV System Sizing Criteria

The UV system sizing criteria is listed in Table 7.2. The basis for the dose is outlined below:

#### 7.6.1.1 Design UVT

A design UVT of 35 percent was originally recommended for the UV system sizing based on a review of the available data collected to date. The original pilot UVT data is summarized in the project memorandum included in Appendix M. The UVT may seem low compared to filtered secondary effluent, but is consistent with effluent expected from other wetlands or natural systems.
